Package ‘Lahman’
April 26, 2022

Type Package
Title Sean 'Lahman' Baseball Database
Version 10.0-1
Date 2022-04-07
Author Michael Friendly [aut],
Chris Dalzell [cre, aut],
Martin Monkman [aut],
Dennis Murphy [aut],
Vanessa Foot [ctb],
Justeena Zaki-Azat [ctb],
Sean Lahman [cph]
Maintainer Chris Dalzell <cdalzell@gmail.com>
Description Provides the tables from the 'Sean Lahman Baseball Database' as a set of R data.frames. It uses the data on pitching, hitting and fielding performance and other tables from 1871 through 2021, as recorded in the 2022 version of the database. Documentation examples show how many baseball questions can be investigated.
Language en-US
Depends R (>= 3.5.0)
Suggests lattice, ggplot2, googleVis, data.table, vcd, reshape2, tidyr, knitr, rmarkdown, car
Imports dplyr
Encoding UTF-8
License GPL

Description

This database contains pitching, hitting, and fielding statistics for Major League Baseball from 1871 through 2021. It includes data from the two current leagues (American and National), the four other "major" leagues (American Association, Union Association, Players League, and Federal League), and the National Association of 1871-1875.

This database was created by Sean Lahman, who pioneered the effort to make baseball statistics freely available to the general public. What started as a one man effort in 1994 has grown tremendously, and now a team of researchers have collected their efforts to make this the largest and most accurate source for baseball statistics available anywhere.

This database, in the form of an R package offers a variety of interesting challenges and opportunities for data processing and visualization in R.

In the current version, the examples make extensive use of the dplyr package for data manipulation (tabulation, queries, summaries, merging, etc.), reflecting the original relational database design and ggplot2 for graphics.

Details

Package: Lahman
Type: Package
Version: 10.0-0
Date: 2022-04-07
License: GPL version 2 or newer
LazyLoad: yes
LazyData: yes

The main form of this database is a relational database in Microsoft Access format. The design follows these general principles: Each player is assigned a unique code (playerID). All of the information in different tables relating to that player is tagged with his playerID. The playerIDs are linked to names and birthdates in the People table. Similar links exist among other tables via analogous *ID variables.

The database is composed of the following main tables:

- **People** Player names, dates of birth, death and other biographical info
- **Batting** batting statistics
- **Pitching** pitching statistics
- **Fielding** fielding statistics

A collection of other tables is also provided:

Teams:
Lahman-package

```
Teams yearly stats and standings
TeamsHalf split season data for teams
TeamsFranchises franchise information
```

Post-season play:
```
BattingPost post-season batting statistics
PitchingPost post-season pitching statistics
FieldingPost post-season fielding data
SeriesPost post-season series information
```

Awards:
```
AwardsManagers awards won by managers
AwardsPlayers awards won by players
AwardsShareManagers award voting for manager awards
AwardsSharePlayers award voting for player awards
```

Hall of Fame: links to People via hofID
```
HallOfFame Hall of Fame voting data
```

Other tables:
```
AllstarFull - All-Star games appearances; Managers - managerial statistics; FieldingOF - outfield position data; ManagersHalf - split season data for managers; Salaries - player salary data; Appearances - data on player appearances; Schools - Information on schools players attended; CollegePlaying - Information on schools players attended, by player and year;
```

Variable label tables are provided for some of the tables:
```
battingLabels, pitchingLabels, fieldingLabels
```

AllstarFull

AllstarFull table

Description
All Star appearances by players

Usage
data(AllstarFull)

Format
A data frame with 5454 observations on the following 8 variables.

playerID  Player ID code
yearID    Year
gameNum   Game number (for years in which more than one game was played)
gameID    Game ID code
teamID    Team; a factor
lgID      League; a factor with levels AL NL
GP       Game played (zero if player did not appear in game)
startingPos  If the player started, what position he played

Source

Examples
data(AllstarFull)

# find number of appearances by players in the All Star games
player_appearances <- with(AllstarFull, rev(sort(table(playerID))))

# How many All-Star players, in total?
length(player_appearances)

# density plot of the whole distribution
plot(density(player_appearances), main="Player appearances in All Star Games")
rug(jitter(player_appearances))

# who has played in more than 10 ASGs?
player_appearances[player_appearances > 10]
hist(player_appearances[player_appearances > 10])
# Hank Aaron's All-Star record:
subset(AllstarFull, playerID == "aaronha01")

# Years that Stan Musial played in the ASG:
with(AllstarFull, yearID[playerID == "musiast01"])

# Starting positions he played (NA means did not start)
with(AllstarFull, startingPos[playerID == "musiast01"])

# All-Star rosters from the 1966 ASG
subset(AllstarFull, gameID == "NLS196607120")

# All-Stars from the Washington Nationals
subset(AllstarFull, teamID == "WAS")

# Teams with the fewest All-Stars
rare <- names(which(table(AllstarFull$teamID) < 10))
# Records associated with the 'rare' teams:
# (There are a few teamID typos: can you spot them?)
subset(AllstarFull, teamID %in% rare)

Description

Data on player appearances

Usage

data(Appearances)

Format

A data frame with 110423 observations on the following 21 variables.

yearID Year
teamID Team; a factor
lgID League; a factor with levels AA AL FL NL PL UA
playerID Player ID code
G_all Total games played
GS Games started
G_batting Games in which player batted
G_defense Games in which player appeared on defense
G_p Games as pitcher
Appearances

G_c  Games as catcher
G_1b  Games as firstbaseman
G_2b  Games as secondbaseman
G_3b  Games as thirdbaseman
G_ss  Games as shortstop
G_1f  Games as leftfielder
G_cf  Games as centerfielder
G_rf  Games as right fielder
G_of  Games as outfielder
G_dh  Games as designated hitter
G_ph  Games as pinch hitter
G_pr  Games as pinch runner

Details

The Appearances table in the original version has some incorrect variable names. In particular, the 5th column is career_year.

Source

Examples

data(Appearances)
library("dplyr")
library("tidyr")

# Henry Aaron's last two years as a DH in Milwaukee
Appearances %>%
  filter(playerID == "aaronha01" & teamID == "ML4") %>%
  select(yearID:G_batting, G_of:G_ph)  # subset variables

# Herb Washington, strictly a pinch runner for Oakland in 1974-5
Appearances %>%
  filter(playerID == "washihe01")

# A true utility player - Jerry Hairston, Jr.
Appearances %>%
  filter(playerID == "hairsje02")

# Appearances for the 1984 Cleveland Indians
Appearances %>%
  filter(teamID == "CLE" & yearID == 1984)

# Pete Rose's primary position each year of his career
Appearances %>%
```r
filter(playerID == "rosepe01") %>%
group_by(yearID, teamID) %>%
gather(pos, G, G_1b:G_rf) %>%
filter(G == max(G)) %>%
select(yearID:G_all, pos, G) %>%
mutate(pos = substring(as.character(pos), 3, 4)) %>%
arrange(yearID, teamID)

# Most pitcher appearances each year since 1950
Appearances %>%
  filter(yearID >= 1950) %>%
  group_by(yearID) %>%
  summarise(maxPitcher = playerID[which.max(G_p)],
            maxAppear = max(G_p))

# Individuals who have played all 162 games since 1961
all162 <- Appearances %>%
  filter(yearID > 1960 & G_all == 162) %>%
  arrange(yearID, playerID) %>%
  select(yearID:G_all)

# Number of all-gamers by year (returns a vector)
table(all162$yearID)

# Players with most pinch hitting appearances in a year
Appearances %>%
  arrange(desc(G_ph)) %>%
  select(playerID, yearID, teamID, lgID, G_all, G_ph) %>%
  head(., 10)

# Players with most pinch hitting appearances, career
Appearances %>%
  group_by(playerID) %>%
  select(playerID, G_all, G_ph) %>%
  summarise(G = sum(G_all), PH = sum(G_ph)) %>%
  arrange(desc(PH)) %>%
  head(., 10)

# Players with most career appearances at each position
Appearances %>%
  select(playerID, G_c:G_rf) %>%
  rename(C = G_c, `1B` = G_1b, `2B` = G_2b, SS = G_ss,
         `3B` = G_3b, LF = G_lf, CF = G_cf, RF = G_rf) %>%
  gather(pos, G, C:RF) %>%
  group_by(pos, playerID) %>%
  summarise(G = sum(G)) %>%
  arrange(desc(G)) %>%
  do(head(., 1))
```
AwardsManagers

Description
Award information for managers awards

Usage
data(AwardsManagers)

Format
A data frame with 179 observations on the following 6 variables.

playerID  Manager (player) ID code
awardID  Name of award won
yearID  Year
lgID  League; a factor with levels AL NL
tie  Award was a tie (Y or N)
notes  Notes about the award

Source

Examples
# Post-season managerial awards

# Number of recipients of each award by year
with(AwardsManagers, table(yearID, awardID))

# 1996 award winners
subset(AwardsManagers, yearID == 1996)

# AL winners of the BBWAA managerial award
subset(AwardsManagers, awardID == "BBWAA Manager of the year" & lgID == "AL")

# Tony LaRussa’s manager of the year awards
subset(AwardsManagers, playerID == "larusto01")
AwardsPlayers

Description
Award information for players awards

Usage
data(AwardsPlayers)

Format
A data frame with 6531 observations on the following 6 variables.

playerID  Player ID code
awardID   Name of award won
yearID    Year
lgID      League; a factor with levels AA AL ML NL
tie       Award was a tie (Y or N)
notes     Notes about the award

Source

Examples
data(AwardsPlayers)
  # Which awards have been given and how many?
  with(AwardsPlayers, table(awardID))
  awardtab <- with(AwardsPlayers, table(awardID))

  # Plot the awardtab table as a Cleveland dot plot
  library("lattice")
  dotplot(awardtab)

  # Restrict to MVP awards
  mvp <- subset(AwardsPlayers, awardID == "Most Valuable Player")
  # Who won in 1994?
  mvp[mvp$yearID == 1994L, ]

  goldglove <- subset(AwardsPlayers, awardID == "Gold Glove")
  # which players won most often?
  GGcount <- table(goldglove$playerID)
  GGcount[GGcount>10]
# Triple Crown winners
subset(AwardsPlayers, awardID == "Triple Crown")

# Simultaneous Triple Crown and MVP winners
# (compare merged file to TC)
TC <- subset(AwardsPlayers, awardID == "Triple Crown")
MVP <- subset(AwardsPlayers, awardID == "Most Valuable Player")
keepvars <- c("playerID", "yearID", "lgID.x")
merge(TC, MVP, by = c("playerID", "yearID"))[ ,keepvars]

**AwardsShareManagers**  **AwardsShareManagers table**

**Description**

Award voting for managers awards

**Usage**

data(AwardsShareManagers)

**Format**

A data frame with 425 observations on the following 7 variables.

- **awardID**: name of award votes were received for
- **yearID**: Year
- **lgID**: League; a factor with levels AL NL
- **playerID**: Manager (player) ID code
- **pointsWon**: Number of points received
- **pointsMax**: Maximum number of points possible
- **votesFirst**: Number of first place votes

**Source**

Examples

# Voting for the BBWAA Manager of the Year award by year and league
require("dplyr")

# Sort in decreasing order of points by year and league
AwardsShareManagers %>%
group_by(yearID, lgID) %>
arrange(desc(pointsWon))

# Any unanimous winners?
AwardsShareManagers %>%
filter(pointsWon == pointsMax)

# Manager with highest proportion of possible points
AwardsShareManagers %>%
mutate(propWon = pointsWon/pointsMax) %>
arrange(desc(propWon)) %>
head(., 1)

# Bobby Cox's MOY vote tallies
AwardsShareManagers %>%
filter(playerID == "coxbo01")

---

**AwardsSharePlayers**  
**AwardsSharePlayers table**

**Description**

Award voting for managers awards

**Usage**

data(AwardsSharePlayers)

**Format**

A data frame with 6879 observations on the following 7 variables.

- **awardID** name of award votes were received for
- **yearID** Year
- **lgID** League; a factor with levels AL ML NL
- **playerID** Player ID code
- **pointsWon** Number of points received
- **pointsMax** Maximum number of points possible
- **votesFirst** Number of first place votes
Source

Examples

# Vote tallies for post-season player awards
require("dplyr")

# Which awards are represented in this data frame?
unique(AwardsSharePlayers$awardID)

# Sort the votes for the Cy Young award in decreasing order.
# Until 1967, the award went to the best pitcher
# in both leagues.

cyvotes <- AwardsSharePlayers %>%
  filter(awardID == "Cy Young") %>%
  group_by(yearID, lgID) %>%
  arrange(desc(pointsWon))

# 2012 votes
subset(cyvotes, yearID == 2012)

# top three votegetters each year by league

cya_top3 <- cyvotes %>%
  group_by(yearID, lgID) %>%
  do(head(., 3))

head(cya_top3, 12)

# unanimous Cy Young winners
subset(cyvotes, pointsWon == pointsMax)

## CYA was a major league award until 1967
# Find top five pitchers with most top 3 vote tallies in CYA
# head(with(cya_top3, rev(sort(table(playerID)))), 5)

# Pre-1967
cya_top3 %>%
  filter(yearID <= 1966) %>%
  group_by(playerID) %>%
  summarise(yrs_top3 = n()) %>%
  arrange(desc(yrs_top3)) %>%
  head(., 2)

# 1967+ (both leagues)
cya_top3 %>%
  filter(yearID > 1966) %>%
  group_by(playerID) %>%
  summarise(yrs_top3 = n()) %>%
```r
arrange(desc(yrs_top3)) %>%
head(., 5)

# 1967+ (by league)
cya_top3 %>%

  filter(n_top3 > 6)
```

---

**Batting**

_Batting table_

**Description**

Batting table - batting statistics

**Usage**

```r
data(Batting)
```

**Format**

A data frame with 110495 observations on the following 22 variables.

- **playerID** Player ID code
- **yearID** Year
- **stint** player’s stint (order of appearances within a season)
- **teamID** Team; a factor
- **lgID** League; a factor with levels AA AL FL NL PL UA
Batting

G Games: number of games in which a player played
AB At Bats
R Runs
H Hits: times reached base because of a batted, fair ball without error by the defense
X2B Doubles: hits on which the batter reached second base safely
X3B Triples: hits on which the batter reached third base safely
HR Homeruns
RBI Runs Batted In
SB Stolen Bases
CS Caught Stealing
BB Base on Balls
SO Strikeouts
IBB Intentional walks
HBP Hit by pitch
SH Sacrifice hits
SF Sacrifice flies
GIDP Grounded into double plays

Details

Variables X2B and X3B are named 2B and 3B in the original database

<table>
<thead>
<tr>
<th>battingLabels</th>
<th>Variable Labels</th>
</tr>
</thead>
</table>

**Description**

These data frames provide descriptive labels for the variables in the Batting, Pitching and Fielding files (and related *Post files). They are useful for plots and other output using Label.

**Usage**

```
data(battingLabels)
data(fieldingLabels)
data(pitchingLabels)
```

**Format**

Each is data frame with observations on the following 2 variables.

- variable variable name
- label variable label

**See Also**

Label

**Examples**

```
data(battingLabels)
str(battingLabels)
require("dplyr")

# find and plot maximum number of homers per year
batHR <- Batting %>%
  filter(!is.na(HR)) %>%
  group_by(yearID) %>%
  summarise(max=max(HR))

with(batHR, {
  plot(yearID, max,
```
BattingPost

```r

cex=0.8)
lines(lowess(yearID, max), col="blue", lwd=2)
abline(lm(max ~ yearID), col="red", lwd=2)
```

---

### BattingPost table

#### Description
Post season batting statistics

#### Usage
```r
data(BattingPost)
```  

#### Format
A data frame with 15879 observations on the following 22 variables.

- **yearID**: Year
- **round**: Level of playoffs
- **playerID**: Player ID code
- **teamID**: Team
- **lgID**: League; a factor with levels AA AL NL
- **G**: Games
- **AB**: At Bats
- **R**: Runs
- **H**: Hits
- **X2B**: Doubles
- **X3B**: Triples
- **HR**: Homeruns
- **RBI**: Runs Batted In
- **SB**: Stolen Bases
- **CS**: Caught stealing
- **BB**: Base on Balls
- **SO**: Strikeouts
- **IBB**: Intentional walks
- **HBP**: Hit by pitch
- **SH**: Sacrifices
- **SF**: Sacrifice flies
- **GIDP**: Grounded into double plays
Details

Variables X2B and X3B are named 2B and 3B in the original database.

# Hitting stats for the 1946 St. Louis Cardinals, ordered by BA
battingStats

Calculate additional batting statistics

Description

The Batting does not contain batting statistics derived from those present in the data.frame. This function calculates batting average (BA), plate appearances (PA), total bases (TB), slugging percentage (SlugPct), on-base percentage (OBP), on-base percentage + slugging (OPS), and batting average on balls in play (BABIP) for each record in a Batting-like data.frame.

Usage

battingStats(data = Lahman::Batting,
             idvars = c("playerID", "yearID", "stint", "teamID", "lgID"),
             cbind = TRUE)

Arguments

data input data, typically Batting
idvars ID variables to include in the output data.frame
cbind If TRUE, the calculated statistics are appended to the input data as additional columns

Details

Standard calculations, e.g., BA <- H/AB are problematic because of the presence of NAs and zeros. This function tries to deal with those problems.

Value

A data.frame with all the observations in data. If cbind==FALSE, only the idvars and the calculated variables are returned.

Examples

```r
bstats <- battingStats()
str(bstats)
bstats <- battingStats(cbind=FALSE)
str(bstats)
```

---

CollegePlaying  

*CollegePlaying table*

Description

Information on schools players attended, by player

Usage

```r
data(CollegePlaying)
```

Format

A data frame with 17350 observations on the following 3 variables.

- `playerID`  Player ID code
- `schoolID`  school ID code
- `yearID`  Year player attended school

Details

This data set reflects a change in the Lahman schema for the 2015 version. The old SchoolsPlayers table was replaced with this new table called CollegePlaying.

According to the documentation, this change reflects advances in the compilation of this data, largely led by Ted Turocy. The old table reported college attendance for major league players by listing a start date and end date. The new version has a separate record for each year that a player attended. This allows us to better account for players who attended multiple colleges or skipped a season, as well as to identify teammates.

Source

Examples

```r
data(CollegePlaying)
head(CollegePlaying)

## Q: What are the top universities for producing MLB players?
SPcount <- table(CollegePlaying$schoolID)
SPcount[SPcount>50]

library("lattice")
dotplot(SPcount[SPcount>50])
dotplot(sort(SPcount[SPcount>50]))

## Q: How many schools are represented in this dataset?
length(table(CollegePlaying$schoolID))

# Histogram of the number of players from each school who played in MLB:
with(CollegePlaying,
    hist(table(schoolID), xlab = "Number of players",
         main = ""))
```

Fielding table

Description

Fielding table

Usage

```r
data(Fielding)
```

Format

A data frame with 147080 observations on the following 18 variables.

- `playerID`: Player ID code
- `yearID`: Year
- `stint`: Player's stint (order of appearances within a season)
- `teamID`: Team; a factor
- `lgID`: League; a factor with levels AA AL FL NL PL UA
- `POS`: Position
- `G`: Games
- `GS`: Games Started
- `InnOuts`: Time played in the field expressed as outs
- `PO`: Putouts
A Assists
E Errors
DP Double Plays
PB Passed Balls (by catchers)
WP Wild Pitches (by catchers)
SB Opponent Stolen Bases (by catchers)
CS Opponents Caught Stealing (by catchers)
ZR Zone Rating

Source

Examples

data(Fielding)
# Basic fielding data
require("dplyr")

# Roberto Clemente's fielding profile
# pitching and catching related data removed
# subset(Fielding, playerID == "clemero01")[, 1:13]
Fielding %>%
  filter(playerID == "clemero01") %>%
  select(1:13)

# Yadier Molina's fielding profile
# PB, WP, SP and CS apply to catchers
Fielding %>%
  subset(playerID == "molinya01") %>%
  select(-WP, -ZR)

# Pedro Martinez's fielding profile
Fielding %>% subset(playerID == "martipe02")

# Table of games played by Pete Rose at different positions
with(subset(Fielding, playerID == "rosepe01"), xtabs(G ~ POS))

# Career total G/PO/A/E/DP for Luis Aparicio
Fielding %>%
  filter(playerID == "aparilu01") %>%
  select(G, PO, A, E, DP) %>%
  summarise_each(funs(sum))

# Top ten 2B/SS in turning DPs
Fielding %>%
FieldingOF

```r
subset(POS %in% c("2B", "SS")) %>%
group_by(playerID) %>%
summarise(TDP = sum(DP, na.rm = TRUE)) %>%
arrange(desc(TDP)) %>%
head(., 10)
```

# League average fielding statistics, 1961-present
Fielding %>%
  filter(yearID >= 1961 & POS != "DH") %>%
  select(yearID, lgID, POS, InnOuts, PO, A, E) %>%
  group_by(yearID, lgID) %>%
  summarise_at(vars(InnOuts, PO, A, E), funs(sum), na.rm = TRUE) %>%
  mutate(fpct = round((PO + A)/(PO + A + E), 3),
            OPE = round(InnOuts/E, 3))

---

**FieldingOF**

**FieldingOF table**

**Description**

Outfield position data: information about positions played in the outfield

**Usage**

```
data(FieldingOF)
```

**Format**

A data frame with 12028 observations on the following 6 variables.

- **playerID** Player ID code
- **yearID** Year
- **stint** player's stint (order of appearances within a season)
- **Glf** Games played in left field
- **Gcf** Games played in center field
- **Grf** Games played in right field

**Source**

Examples

```r
require("dplyr") require("tidyr")

## Data set only goes through 1955
## Can get a more complete record from the Fielding data frame
## or from the Appearances data (see below)

## Output directly from the FieldingOF data

## Barry Bonds (no records: post-1955 player)
FieldingOF %>%
  filter(playerID == "bondsba01")

## Willie Mays (first few years)
FieldingOF %>%
  filter(playerID == "mayswi01")

## Ty Cobb (complete)
FieldingOF %>%
  filter(playerID == "cobbty01")

## One way to get OF game information from the Fielding data
## Note: OF games != sum(LF, CF, RF) because players can switch
## OF positions within a game. Players can also switch from
## other positions to outfield during a game. OF represents
## the number of games a player started in the outfield.
Fielding %>%
  select(playerID, yearID, stint, POS, G) %>%
  filter(POS %in% c("LF", "CF", "RF", "OF")) %>%
  tidyr::spread(POS, G, fill = 0) %>%
  filter(playerID == "trumbma01")

## Another way is through the Appearances data (no stint).
## Provides a somewhat nicer table than the above.

## Mark Trumbo (active player)
Appearances %>%
  select(playerID, yearID, G_lf, G Cf, G_rf, G_of) %>%
  filter(playerID == "trumbma01")

## A slightly better format, perhaps
Appearances %>%
  select(playerID, yearID, G_lf, G Cf, G_rf, G_of) %>%
  rename(LF = G_lf, CF = G Cf, RF = G_rf, OF = G_of) %>%
  filter(playerID == "trumbma01")

## Willie Mays (1951-1973)
Appearances %>%
  select(playerID, yearID, G_lf, G Cf, G_rf, G_of) %>%
  filter(playerID == "mayswi01")
```
## Joe DiMaggio (1936-1951)

```r
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "dimagjo01")
```

### Description

Outfield position data: information about positions played in the outfield

### Usage

```r
data(FieldingOF)
```

### Format

A data frame with 34563 observations on the following 18 variables.

- `playerID`: Player ID code
- `yearID`: Year
- `stint`: Player's stint (order of appearances within a season)
- `teamID`: Team; a factor
- `lgID`: League; a factor with levels AA AL FL NL PL UA
- `POS`: Position
- `G`: Games
- `GS`: Games Started
- `InnOuts`: Time played in the field expressed as outs
- `PO`: Putouts
- `A`: Assists
- `E`: Errors
- `DP`: Double Plays
- `PB`: Passed Balls (by catchers)
- `WP`: Wild Pitches (by catchers)
- `SB`: Opponent Stolen Bases (by catchers)
- `CS`: Opponents Caught Stealing (by catchers)
- `ZR`: Zone Rating

### Source

### HallOfFame

**Hall of Fame Voting Data**

#### Description

Hall of Fame table. This is composed of the voting results for all candidates nominated for the Baseball Hall of Fame.

#### Usage

data(HallOfFame)

#### Format

A data frame with 4191 observations on the following 9 variables.

- **playerID**: Player ID code
- **yearID**: Year of ballot
- **votedBy**: Method by which player was voted upon. See Details
- **ballots**: Total ballots cast in that year
- **needed**: Number of votes needed for selection in that year
- **votes**: Total votes received
- **inducted**: Whether player was inducted by that vote or not (Y or N)
- **category**: Category of candidate; a factor with levels Manager Pioneer/Executive Player Umpire
- **needed_note**: Explanation of qualifiers for special elections

#### Details

This table links to the People table via the playerID.

votedBy: Most Hall of Fame inductees have been elected by the Baseball Writers Association of America (BBWAA). Rules for election are described in [https://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process](https://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process).

#### Source

Examples

```r
## Some examples for Hall of Fame induction data
require("dplyr")
require(\"ggplot2\")

# What are the different types of HOF voters?
table(HallOfFame$votedBy)

# What was the first year of Hall of Fame elections?
sort(unique(HallOfFame$yearID))[1]

# Who comprised the original class?
subset(HallOfFame, yearID == 1936 & inducted == "Y")

# Result of a player's last year on the BBWAA ballot
# Restrict to players voted by BBWAA:
HOFplayers <- subset(HallOfFame, votedBy == "BBWAA" & category == "Player")

# Number of years as HOF candidate, last pct vote, etc.
# for a given player
playerOutcomes <- HallOfFame
  filter(votedBy == "BBWAA" & category == "Player")
  group_by(playerID)
  mutate(nyears = length(ballots))
  arrange(yearID)
  do(tail(., 1))
  mutate(lastPct = 100 * round(votes/ballots, 3))
  select(playerID, nyears, inducted, lastPct, yearID)
  rename(lastYear = yearID)

# How many voting years until election?
inducted <- subset(playerOutcomes, inducted == "Y")
table(inducted$nyears)

# Bar chart of years to induction for inductees
barplot(table(inducted$nyears), main="Number of voting years until election",
        ylab="Number of players", xlab="Years")
box()

# What is the form of this distribution?
require("vcd")
goodfit(inducted$nyears)
plot(goodfit(inducted$nyears), xlab="Number of years",
     main="Poissonness plot of number of years voting until election")
```
Ord_plot(table(inducted$nyears), xlab="Number of years")

# First ballot inductees sorted by vote percentage:
playerOutcomes %>%
  filter(nyears == 1L & inducted == "Y") %>%
  arrange(desc(lastPct))

# Who took at least ten years on the ballot before induction?
playerOutcomes %>%
  filter(nyears >= 10L & inducted == "Y")

############################################################
## Plots of voting percentages over time for the borderline
## HOF candidates, according to the BBWAA:
# Identify players on the BBWAA ballot for at least 10 years
# Returns a character vector of playerIDs
longTimers <- as.character(unlist(subset(playerOutcomes, nyears >= 10, select = "playerID")))

# Extract their information from the HallOfFame data
HOFlt <- HallOfFame %>%
  filter(playerID %in% longTimers & votedBy == "BBWAA") %>%
  group_by(playerID) %>%
  mutate(elected = ifelse(any(inducted == "Y"), "Elected", "Not elected"),
    pct = 100 * round(votes/ballots, 3))

# Plot the voting profiles:
ggplot(HOFlt, aes(x = yearID, y = pct,
    group = playerID)) +
  ggtitle("Profiles of BBWAA voting percentage, long-time HOF candidates") +
  geom_line() +
  geom_hline(yintercept = 75, colour = "red") +
  labs(x = "Year", y = "Percentage of votes") +
  facet_wrap(~ elected, ncol = 1)

## Eventual inductees tend to have increasing support over time.
## Fit simple linear regression models to each player’s voting
## percentage profile and extract the slopes. Then compare the
## distributions of the slopes in each group.
# data frame for playerID and induction status among
# long term candidates
HOFstatus <- HOFlt %>%
  group_by(playerID) %>%
  select(playerID, elected, inducted) %>%
  do(tail(., 1))

# data frame of regression slopes, which represent average
# increase in percentage support by BBWAA members over a
# player's candidacy.
HOFslope <- HOFlt %>%
  group_by(playerID) %>%
  do(mod = lm(pct ~ yearID, data = .)) %>%
  do(data.frame(slope = coef(.$mod)[2]))

## Boxplots of regression slopes by induction group
ggplot(data.frame(HOFstatus, HOFslope),
       aes(x = elected, y = slope)) +
  geom_boxplot(width = 0.5) +
  geom_point(position = position_jitter(width = 0.2))

# Note 1: Only two players whose maximum voting percentage
# was over 60% were not eventually inducted
# into the HOF: Gil Hodges and Jack Morris.
# Red Ruffing was elected in a 1967 runoff election while
# the others have been voted in by the Veterans Committee.

# Note 2: Of the players whose slope was >= 2.5 among
# non-inductees, only Jack Morris has not (yet) been
# subsequently inducted into the HOF; however, his last year of
# eligibility was 2014 so he could be inducted by a future
# Veterans Committee.

---

**HomeGames**

**HomeGames table**

**Description**

Data mapping teams to the stadiums they played regular season games in as the home team.

**Usage**

data(HomeGames)

**Format**

A data frame with 3195 observations on the following 9 variables.

- year.key: Year
- league.key: League; a factor with levels AA AL FL NL PL UA
- team.key: Team; a factor
- park.key: Unique identifier for each ballpark
- span.first: First date the park began acting as home field for the team
- span.last: Last date the park began acting as home field for the team
- games: Total games in this time span
- openings: Total opening in this time span
- attendance: Total attendance in this time span
Source

Examples

```r
data(HomeGames)
library(dplyr)

# How many parks has every team played in as the home team for even a single game?
HomeGames %>%
  count(team.key) %>%
  arrange(team.key)

# What parks have the Toronto Blue Jays played in as the home team?
HomeGames %>%
  filter(team.key == "TOR") %>%
  arrange(span.last)

# What parks have the Boston Red Sox played in as the home team?
HomeGames %>%
  filter(team.key == "BOS") %>%
  arrange(span.last)

# What is the Toronto Blue Jays annual total home attendance by year?
HomeGames %>%
  filter(team.key == "TOR") %>%
  group_by(year.key) %>%
  summarize(total.attendance = sum(attendance)) %>%
  arrange(year.key)
```

---

**Label**

*Extract the Label for a Variable*

**Description**

Extracts the label for a variable from one or more of the *Labels* files. This is useful for plots and other displays because the variable names are often cryptically short.

**Usage**

```r
Label(var, labels = rbind(Lahman::battingLabels,
                          Lahman::pitchingLabels,
                          Lahman::fieldingLabels))
```

**Arguments**

- `var`: name of a variable
- `labels`: label table(s) to search, a 2-column dataframe containing variable names and labels.
Value

Returns the variable label, or var if no label is found

Author(s)

Michael Friendly

})
```

### LahmanData

**Lahman Datasets**

**Description**

This dataset gives a concise description of the data files in the Lahman package. It may be useful for computing on the various files.

**Usage**

data(LahmanData)

**Format**

A data frame with 24 observations on the following 5 variables.

- **file**: name of dataset
- **class**: class of dataset
- **nobs**: number of observations
- **nvar**: number of variables
- **title**: dataset title
Details

This dataset is generated using `vcdExtra::datasets(package="Lahman")` with some post-processing.

Examples

data(LahmanData)

# find ID variables in the datasets

text(config[,1], config[,2], rownames(config), cex = 0.75, pos=pos, xpd=NA)
Description

Managers table: information about individual team managers, teams they managed and some basic statistics for those teams in each year.

Usage

data(Managers)

Format

A data frame with 3684 observations on the following 10 variables.

playerID  Manager (player) ID code
yearID     Year
teamID     Team; a factor
lgID       League; a factor with levels AA AL FL NL PL UA
inseason   Managerial order. Zero if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.)
G          Games managed
W          Wins
L          Losses
rank       Team’s final position in standings that year
plyrMgr    Player Manager (denoted by ‘Y’); a factor with levels N Y

  geom_smooth()

ManagersHalf  

ManagersHalf table

Description

Split season data for managers

Usage

data(ManagersHalf)

Format

A data frame with 93 observations on the following 10 variables.

playerID  Manager (player) ID code
yearID  Year
teamID  Team; a factor
lgID  League; a factor with levels AL NL
inseason  Managerial order. One if the individual managed the team the entire year. Otherwise it denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.). A factor with levels 1 2 3 4 5
half  First or second half of season
G  Games managed
W  Wins
L  Losses
rank  Team’s position in standings for the half
Parks

Source

Examples

library("dplyr")
library("reshape2")

# Only have data for 1892 and 1981
# League rank by half for 1981 teams with the same
# manager in both halves who were hired in-season
ManagersHalf %>%
  filter(yearID >= 1901) %>%
  group_by(teamID, yearID) %>%
  filter(all(playerID == playerID[1])) %>%
  mutate(winPct = round(W/G, 3)) %>%
  reshape2::dcast(playerID + yearID + teamID + lgID ~ half,
                 value.var = "rank") %>%
  rename(rank1 = `1`, rank2 = `2`)

Parks

Parks table

Description

Name and location data for baseball stadiums.

Usage

data(Parks)

Format

A data frame with 255 observations on the following 6 variables.

- park.key unique identifier for each ballpark
- park.name the name of the ballpark
- park.alias a semicolon delimited list of other names for the ballpark if they exist
- city city where the ballpark is located
- state state where the ballpark is located
- country country where the ballpark is located

Details

This dataset apparently includes all ballparks that were ever used in baseball. There is no indication of the years they were used, nor the teams that played there.

The ballparks can be associated with teams through the park variable in the Teams table.

People table

### Description

People table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the Batting, Pitching, and other files where players are identified only by playerID.

### Usage

data(People)
Format

A data frame with 20370 observations on the following 26 variables.

playerID A unique code assigned to each player. The playerID links the data in this file with 
records on players in the other files.
birthYear Year player was born
birthMonth Month player was born
birthDay Day player was born
birthCountry Country where player was born
birthState State where player was born
birthCity City where player was born
deathYear Year player died
deathMonth Month player died
deathDay Day player died
deathCountry Country where player died
deathState State where player died
deathCity City where player died
nameFirst Player’s first name
nameLast Player’s last name
nameGiven Player’s given name (typically first and middle)
weight Player’s weight in pounds
height Player’s height in inches
bats a factor: Player’s batting hand (left (L), right (R), or both (B))
throws a factor: Player’s throwing hand (left(L) or right(R))
debut Date that player made first major league appearance
finalGame Date that player made first major league appearance (blank if still active)
retroID ID used by retrosheet, https://www.retrosheet.org/
bbrefID ID used by Baseball Reference website, https://www.baseball-reference.com/
birthDate Player’s birthdate, in as.Date format
deathDate Player’s deathdate, in as.Date format

Details

debut, finalGame were converted from character strings with as.Date.

Pitching

Description

Pitching table

Usage

data(Pitching)

Format

A data frame with 48399 observations on the following 30 variables.

playerID  Player ID code
yearID    Year
stint     player's stint (order of appearances within a season)
teamID    Team; a factor
lgID      League; a factor with levels AA AL FL NL PL UA
W         Wins
Pitching

L  Losses
G  Games
GS  Games Started
CG  Complete Games
SHO  Shutouts
SV  Saves
IPouts  Outs Pitched (innings pitched x 3)
H  Hits
ER  Earned Runs
HR  Homeruns
BB  Walks
SO  Strikeouts
BA0pp  Opponent’s Batting Average
ERA  Earned Run Average
IBB  Intentional Walks
WP  Wild Pitches
HBP  Batters Hit By Pitch
BK  Balks
BFP  Batters faced by Pitcher
GF  Games Finished
R  Runs Allowed
SH  Sacrifices by opposing batters
SF  Sacrifice flies by opposing batters
GIDP  Grounded into double plays by opposing batter

Source

---

**playerInfo**

*Lookup Information for Players and Teams*

---

**Description**

These functions use `grep` to lookup information about players (from the `People` file) and teams (from the `Teams` file).

**Usage**

```r
playerInfo(playerID, nameFirst, nameLast, data = Lahman::People, extra = NULL, ...)

teamInfo(teamID, name, data = Lahman::Teams, extra = NULL, ...)
```

**Arguments**

- `playerID` pattern for `playerID`
- `nameFirst` pattern for first name
- `nameLast` pattern for last name
- `data` The name of the dataset to search
- `extra` A character vector of other fields to include in the result
- `...` other arguments passed to `grep`
- `teamID` pattern for `teamID`
- `name` pattern for team name

**Value**

Returns a data frame for unique matching rows from `data`

**Author(s)**

Michael Friendly

SeriesPost  

**SeriesPost table**

**Description**

Post season series information

**Usage**

```r
data(SeriesPost)
```

**Format**

A data frame with 367 observations on the following 9 variables.

- **yearID** Year
round  Level of playoffs
teamIDwinner  Team ID of the team that won the series; a factor
lgIDwinner  League ID of the team that won the series; a factor with levels AL NL
teamIDloser  Team ID of the team that lost the series; a factor
lgIDloser  League ID of the team that lost the series; a factor with levels AL NL
wins  Wins by team that won the series
losses  Losses by team that won the series
ties  Tie games

Source

Examples

data(SeriesPost)

# How many times has each team won the World Series?

# Notes:
# - the SeriesPost table includes an identifier for the
# team (teamID), but not the franchise (e.g. the Brooklyn Dodgers
# [BRO] and Los Angeles Dodgers [LAN] are counted separately)
#
# - the World Series was first played in 1903, but the
# Lahman data tables have the final round of the earlier
# playoffs labelled "WS", so it is necessary to
# filter the SeriesPost table to exclude years prior to 1903.

# using the dplyr data manipulation package
library("dplyr")
library("tidyr")
library("ggplot2")

## WS winners, arranged in descending order of titles won

  filter(yearID >= 1903 & round == "WS") %>%
  select(-ties, -round) %>%
  mutate(lgIDloser = droplevels(lgIDloser),
         lgIDwinner = droplevels(lgIDwinner))
Teams

Teams table

Description

Yearly statistics and standings for teams
Usage
data(Teams)

Format
A data frame with 2985 observations on the following 48 variables.

yearID Year
lgID League; a factor with levels AA AL FL NL PL UA
teamID Team; a factor
franchID Franchise (links to TeamsFranchises table)
divID Team’s division; a factor with levels C E W
Rank Position in final standings
G Games played
Ghome Games played at home
W Wins
L Losses
DivWin Division Winner (Y or N)
WCWin Wild Card Winner (Y or N)
LgWin League Champion (Y or N)
WSWin World Series Winner (Y or N)
R Runs scored
AB At bats
H Hits by batters
X2B Doubles
X3B Triples
HR Homeruns by batters
BB Walks by batters
SO Strikeouts by batters
SB Stolen bases
CS Caught stealing
HBP Batters hit by pitch
SF Sacrifice flies
RA Opponents runs scored
ER Earned runs allowed
ERA Earned run average
CG Complete games
SHO Shutouts
SV Saves
Teams

IPouts  Outs Pitched (in innings pitched x 3)
HA  Hits allowed
HRA  Homeruns allowed
BBA  Walks allowed
SOA  Strikeouts by pitchers
E  Errors
DP  Double Plays
FP  Fielding percentage
name  Team’s full name
park  Name of team’s home ballpark
attendance  Home attendance total
BPF  Three-year park factor for batters
PPF  Three-year park factor for pitchers
teamIDBR  Team ID used by Baseball Reference website
teamIDlahman45  Team ID used in Lahman database version 4.5
teamIDretro  Team ID used by Retrosheet

Details

Variables X2B and X3B are named 2B and 3B in the original database

## End(Not run)
TeamsFranchises Table

Description

Information about team franchises

Usage

data(TeamsFranchises)

Format

A data frame with 120 observations on the following 4 variables.

- `franchID` Franchise ID; a factor
- `franchName` Franchise name
- `active` Whether team is currently active (Y or N)
- `NAassoc` ID of National Association team franchise played as

Source

Examples

data(TeamsFranchises)

# Which of the active Major League Baseball teams had a National Association predecessor?

# Notes:
# - the National Association was founded in 1871, and continued through the 1875 season. In 1876, six clubs from the National Association and two other independent clubs formed the National League, which exists to this day.
# - the `active` field has "NA" for the National Association franchises
# - where appropriate, the `NAassoc` field has the `franchID` of the successor National League team

# using the dplyr data manipulation package
library("dplyr")

NatAssoc_active_table <- TeamsFranchises %>%
  filter(active == "Y") %>%
  filter(!is.na(NAassoc))
NatAssoc_active_table

# Merge current team IDs with franchise IDs
currentTeams <- Teams %>%
  filter(yearID == 2014) %>%
TeamsHalf

```r
select(teamID, franchID, lgID, park)
# Merge TeamsFranchises with currentTeams
TeamsFranchises %>%
  filter(active == "Y") %>%
  select(~active, -NAassoc) %>%
  left_join(currentTeams, by = "franchID")
```
