coef.UPG.Probit ......................................................... 5
Extract coefficients from UPG.Binomial objects

Description

coef can be used to extract posterior means and credible intervals based on posterior quantiles from UPG.Binomial objects.

Usage

```r
## S3 method for class 'UPG.Binomial'
coef(object, ..., q = c(0.025, 0.975))
```
coef.UPG.Logit

Arguments

  object      an object of class UPG.Binomial.
  ...         other coef parameters.
  q           a numerical vector of length two providing the posterior quantiles to be ex-
              racted. Default are 0.025 and 0.975 quantiles.

Value

  Returns a matrix containing posterior means and the desired credible interval.

Author(s)

  Gregor Zens

See Also

  summary.UPG.Binomial to summarize a UPG.Binomial object and create tables. predict.UPG.Binomial to predict probabilities using a UPG.Binomial object. plot.UPG.Binomial to plot a UPG.Binomial object.

Examples

  # estimate a binomial logit model using example data
  library(UPG)
  data(titanic)
  y = titanic[,1]
  Ni = titanic[,2]
  X = titanic[,-c(1,2)]
  results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial")

  # extract posterior means and credible interval based on 0.025 and 0.975 quantiles
  coef(results.binomial, q = c(0.025, 0.975))
coef.UPG.MNL

### Arguments

- `object` an object of class `UPG.Logit`.
- `...` other coef parameters.
- `q` a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

### Value

Returns a matrix containing posterior means and the desired credible interval.

### Author(s)

Gregor Zens

### See Also

- `summary.UPG.Logit` to summarize a `UPG.Logit` object and create tables.
- `predict.UPG.Logit` to predict probabilities using a `UPG.Logit` object.
- `plot.UPG.Logit` to plot a `UPG.Logit` object.

### Examples

```r
# estimate a logit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.logit = UPG(y = y, X = X, model = "logit")

# extract posterior means and credible interval based on 0.025 and 0.975 quantiles
coef(results.logit, q = c(0.025, 0.975))
```

---

**coef.UPG.MNL**

**Extract coefficients from UPG.MNL objects**

### Description

`coef` can be used to extract posterior means and credible intervals based on posterior quantiles from `UPG.MNL` objects.

### Usage

```r
## S3 method for class 'UPG.MNL'
coef(object, ..., q = c(0.025, 0.975))
```
coef.UPG.Probit

Arguments

- **object**: an object of class UPG.MNL.
- **...**: other coef parameters.
- **q**: a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

Value

Returns a list containing posterior means and the desired credible interval.

Author(s)

Gregor Zens

See Also

summary.UPG.MNL to summarize a UPG.MNL object and create tables. predict.UPG.MNL to predict probabilities using a UPG.MNL object. plot.UPG.MNL to plot a UPG.MNL object.

Examples

```r
# estimate a multinomial logit model using example data
library(UPG)
data(program)
y = program[,1]
X = program[,-1]
results.mnl = UPG(y = y, X = X, model = "mnl")

# extract posterior means and credible interval based on 0.025 and 0.975 quantiles
coef(results.mnl, q = c(0.025, 0.975))
```

---

coef.UPG.Probit  Extract coefficients from UPG.Probit objects

Description

coef can be used to extract posterior means and credible intervals based on posterior quantiles from UPG.Probit objects.

Usage

```r
## S3 method for class 'UPG.Probit'
coef(object, ..., q = c(0.025, 0.975))
```
Arguments

object an object of class UPG.Probit.
... other coef parameters.
q a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

Value

Returns a matrix containing posterior means and the desired credible interval.

Author(s)

Gregor Zens

See Also

summary.UPG.Probit to summarize a UPG.Probit object and create tables. predict.UPG.Probit to predict probabilities using a UPG.Probit object. plot.UPG.Probit to plot a UPG.Probit object.

Examples

# estimate a probit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.probit = UPG(y = y, X = X, model = "probit")

# extract posterior means and credible interval based on 0.025 and 0.975 quantiles
coef(results.probit, q = c(0.025, 0.975))

lfp Female labor force participation data.

Description

A dataset containing socio-economic characteristics as well as a labor force participation dummy for 753 married women from the panel study of income dynamics.

Usage

lfp
A data frame with 753 rows and 9 variables:

- **lfp**: binary indicator for participating in the labor force (=1) or not (=0)
- **intercept**: intercept
- **k5**: number of children 5 years old or younger
- **k618**: number of children 6 to 18 years old
- **age**: age in years
- **wc**: binary indicator for college education of the wife
- **hc**: binary indicator for college education of the husband
- **lwg**: log expected wage rate; for women in the labor force, the actual wage rate; for women not in the labor force, an imputed value based on a regression of lwg on the other variables
- **inc**: family income exclusive of wife’s income

Description

`logLik.UPG.Binomial` can be used to compute log-likelihoods from UPG.Binomial objects. The log-likelihood is based on the posterior mean of the coefficients.

Usage

```r
## S3 method for class 'UPG.Binomial'
logLik(object = NULL, ...)
```

Arguments

- `object`: an object of class UPG.Binomial.
- `...`: other logLik parameters.

Value

Returns a numeric of class logLik with attributes containing the number of estimated parameters and the number of observations.

Author(s)

Gregor Zens
See Also

`summary.UPG.Binomial` to summarize a UPG.Binomial object and create tables. `plot.UPG.Binomial` to plot a UPG.Binomial object. `coef.UPG.Binomial` to extract coefficients from a UPG.Binomial object.

Examples

```r
# estimate a binomial logit model using example data
library(UPG)
data(titanic)
y = titanic[,1]
Ni = titanic[,2]
X = titanic[,-c(1,2)]
results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial")

# extract log-likelihood
ll.binomial = logLik(results.binomial)
```

Description

`logLik` can be used to compute log-likelihoods from UPG.Logit objects. The log-likelihood is based on the posterior mean of the coefficients.

Usage

```r
## S3 method for class 'UPG.Logit'
logLik(object = NULL, ...)
```

Arguments

- `object` an object of class UPG.Logit.
- `...` other logLik parameters.

Value

Returns a numeric of class `logLik` with attributes containing the number of estimated parameters and the number of observations.

Author(s)

Gregor Zens
`logLik.UPG.MNL`  

**See Also**  

`summary.UPG.Logit` to summarize a UPG.Logit object and create tables. `plot.UPG.Logit` to plot a UPG.Logit object. `coef.UPG.Logit` to extract coefficients from a UPG.Logit object.

**Examples**

```r
# estimate a logit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.logit = UPG(y = y, X = X, model = "logit")

# extract log-likelihood
ll.logit = logLik(results.logit)
```

---

**logLik.UPG.MNL**  

*Compute log-likelihoods from UPG.MNL objects*

**Description**

`logLik` can be used to compute log-likelihoods from UPG.MNL objects. The log-likelihood is based on the posterior mean of the coefficients.

**Usage**

```r
## S3 method for class 'UPG.MNL'
logLik(object = NULL, ...)
```

**Arguments**

- `object`  
  an object of class UPG.MNL.

- `...`  
  other logLik parameters.

**Value**

Returns a numeric of class `logLik` with attributes containing the number of estimated parameters and the number of observations.

**Author(s)**

Gregor Zens
logLik.UPG.Probit

Compute log-likelihoods from UPG.Probit objects

Description

logLik can be used to compute log-likelihoods from UPG.Probit objects. The log-likelihood is based on the posterior mean of the coefficients.

Usage

## S3 method for class 'UPG.Probit'
logLik(object = NULL, ...)

Arguments

object an object of class UPG.Probit.
...
other logLik parameters.

Value

Returns a numeric of class logLik with attributes containing the number of estimated parameters and the number of observations.

Author(s)

Gregor Zens
plot.UPG.Binomial

See Also

summary.UPG.Probit to summarize a UPG.Probit object and create tables. plot.UPG.Probit to plot a UPG.Probit object. coef.UPG.Probit to extract coefficients from a UPG.Probit object.

Examples

# estimate a probit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.probit = UPG(y = y, X = X, model = "probit")

# extract log-likelihood
ll.probit = logLik(results.probit)

plot.UPG.Binomial

Coefficient plots for UPG.Binomial objects

Description

plot generates plots from UPG.Binomial objects using ggplot2. Coefficient plots show point estimates for all coefficients as well as their credible intervals.

Usage

## S3 method for class 'UPG.Binomial'
plot(
  x = NULL,
  ..., 
  sort = FALSE,
  names = NULL,
  xlab = NULL,
  ylab = NULL,
  q = c(0.025, 0.975), 
  include = NULL
)

Arguments

x an object of class UPG.Binomial.
...
other plot parameters.
sort a logical variable indicating whether the plotted coefficients should be sorted according to effect sizes. Default is FALSE.
names a character vector indicating names for the variables used in the plots.
xlab a character vector of length 1 indicating a title for the x-axis.
ylab a character vector of length 1 indicating a title for the y-axis.
q a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.
include can be used to plot only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.

Value

Returns a ggplot2 object.

Author(s)

Gregor Zens

See Also

summary.UPG.Binomial to summarize a UPG.Binomial object and create tables. predict.UPG.Binomial to predict probabilities using a UPG.Binomial object. coef.UPG.Binomial to extract coefficients from a UPG.Binomial object.

Examples

# estimate a binomial logit model using example data
library(UPG)
data(titanic)
y = titanic[,1]
Ni = titanic[,2]
X = titanic[, -c(1, 2)]
results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial")

# plot the results and sort coefficients by effect size
plot(results.binomial, sort = TRUE)

# plot only variables 1 and 3 with custom names, credible intervals and axis labels
plot(results.binomial,
     include = c(1, 3),
     names = c("Custom 1", "Custom 2"),
     q = c(0.1, 0.9),
     xlab = c("Custom X"),
     ylab = c("Custom Y"))
plot.UPG.Logit

Description

plot generates plots from UPG.Logit objects using ggplot2. Coefficient plots show point estimates for all coefficients as well as their credible intervals.

Usage

## S3 method for class 'UPG.Logit'
plot(
  x = NULL,
  ..., 
  sort = FALSE,
  names = NULL,
  xlab = NULL,
  ylab = NULL,
  q = c(0.025, 0.975),
  include = NULL
)

Arguments

x an object of class UPG.Logit.

... other plot parameters.

sort a logical variable indicating whether the plotted coefficients should be sorted according to effect sizes. Default is FALSE.

names a character vector indicating names for the variables used in the plots.

xlab a character vector of length 1 indicating a title for the x-axis.

ylab a character vector of length 1 indicating a title for the y-axis.

q a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

include can be used to plot only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.

Value

Returns a ggplot2 object.

Author(s)

Gregor Zens
See Also

summary.UPG.Logit to summarize a UPG.Logit object and create tables. predict.UPG.Logit to predict probabilities using a UPG.Logit object. coef.UPG.Logit to extract coefficients from a UPG.Logit object.

Examples

# estimate a logit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,,-1]
results.logit = UPG(y = y, X = X, model = "logit")

# plot the results and sort coefficients by effect size
plot(results.logit, sort = TRUE)

# plot only variables 1 and 3 with custom names, credible intervals and axis labels
plot(results.logit,
     include = c(1,3),
     names = c("Custom 1", "Custom 2"),
     q = c(0.1, 0.9),
     xlab = c("Custom X"),
     ylab = c("Custom Y"))

plot.UPG.MNL

Coefficient plots for UPG.MNL objects

Description

plot generates plots from UPG.MNL objects using ggplot2. Coefficient plots show point estimates for all coefficients in all groups except the baseline as well as their credible intervals.

Usage

## S3 method for class 'UPG.MNL'
plot(
x = NULL,
..., 
sort = FALSE,
names = NULL,
groups = NULL,
xlab = NULL,
ylab = NULL,
q = c(0.025, 0.975),
include = NULL
)
Arguments

- **x**: an object of class `UPG.MNL`
- **...**: other plot parameters.
- **sort**: a logical variable indicating whether the plotted coefficients should be sorted according to average effect sizes across groups. Default is `FALSE`.
- **names**: a character vector indicating names for the variables used in the plots.
- **groups**: a character vector indicating names for the groups excluding the baseline. The group names must correspond to the ordering in the dependent variable used for estimation.
- **xlab**: a character vector of length 1 indicating a title for the x-axis.
- **ylab**: a character vector of length 1 indicating a title for the y-axis.
- **q**: a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.
- **include**: can be used to plot only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.

Value

Returns a ggplot2 object.

Author(s)

Gregor Zens

See Also

- `summary.UPG.MNL` to summarize a `UPG.MNL` object and create tables.
- `predict.UPG.MNL` to predict probabilities using a `UPG.MNL` object.
- `coef.UPG.MNL` to extract coefficients from a `UPG.MNL` object.

Examples

```r
# estimate a multinominal logit model using example data
library(UPG)
data(program)
y = program[,1]
X = program[,-1]
results.mnl = UPG(y = y, X = X, model = "mnl")

# plot the results and sort coefficients by average effect size
plot(results.mnl, sort = TRUE)

# plot only variables 1 and 3 with custom group and variable names
# also, customize credible intervals and axis labels
plot(results.mnl,
     include = c(1,3),
     names = c("Custom 1", "Custom 2"),
     groups = c("Alpha", "Beta"),
)
```
**plot.UPG.Probit**

Coefficient plots for UPG.Probit objects

**Description**

`plot` generates plots from UPG.Probit objects using ggplot2. Coefficient plots show point estimates for all coefficients as well as their credible intervals.

**Usage**

```r
## S3 method for class 'UPG.Probit'
plot(
  x = NULL,
  ...,
  sort = FALSE,
  names = NULL,
  xlab = NULL,
  ylab = NULL,
  q = c(0.025, 0.975),
  include = NULL
)
```

**Arguments**

- **x**
  - an object of class UPG.Probit.
- **...**
  - other plot parameters.
- **sort**
  - a logical variable indicating whether the plotted coefficients should be sorted according to effect sizes. Default is FALSE.
- **names**
  - a character vector indicating names for the variables used in the plots.
- **xlab**
  - a character vector of length 1 indicating a title for the x-axis.
- **ylab**
  - a character vector of length 1 indicating a title for the y-axis.
- **q**
  - a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.
- **include**
  - can be used to plot only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.

**Value**

Returns a ggplot2 object.
**predict.UPG.Binomial**

**Predicted probabilities from UPG.Binomial objects**

**Description**

`predict` generates predicted probabilities from a `UPG.Binomial` object. In addition, credible intervals for these probabilities are computed. Probabilities can be predicted from the data used for estimating the model or for a new data set with the same structure.

**Usage**

```r
## S3 method for class 'UPG.Binomial'
predict(object = NULL, ..., newdata = NULL, q = c(0.025, 0.975))
```
Arguments

object an object of class UPG.Binomial.

... other predict parameters.

newdata a matrix or a data.frame containing new explanatory data. The number of columns and the variable ordering must be the same as in the explanatory data used for estimation to generate valid predictions. If no new data is provided, predict will return predicted probabilities for the data used for estimating the model.

q a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

Value

Returns a list containing posterior means of predicted probabilities as well as the desired credible interval.

Author(s)

Gregor Zens

library(UPG)
data(titanic)
y = titanic[,1]
Ni = titanic[,2]
X = titanic[,-c(1,2)]
results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial")

# extract predicted probabilities
predict(results.binomial)
predict.UPG.Logit

Predicted probabilities from UPG.Logit objects

Description

predict generates predicted probabilities from a UPG.Logit object. In addition, credible intervals for these probabilities are computed. Probabilities can be predicted from the data used for estimating the model or for a new data set with the same structure.

Usage

## S3 method for class 'UPG.Logit'
predict(object = NULL, ..., newdata = NULL, q = c(0.025, 0.975))

Arguments

- `object` an object of class UPG.Logit.
- `...` other predict parameters.
- `newdata` a matrix or a data.frame containing new explanatory data. The number of columns and the variable ordering must be the same as in the explanatory data used for estimation to generate valid predictions. If no new data is provided, predict will return predicted probabilities for the data used for estimating the model.
- `q` a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

Value

Returns a list containing posterior means of predicted probabilities as well as the desired credible interval.

```
Description

print provides some basic information about a UPG.Probit object.

Usage

```r
## S3 method for class 'UPG.Probit'
print(x, ...)
```

Arguments

- `x` an object of class UPG.Probit.
- `...` other print parameters.

Author(s)

Gregor Zens

See Also

`summary.UPG.Probit` to summarize a UPG.Probit object and create tables. `predict.UPG.Probit` to predict probabilities using a UPG.Probit object. `plot.UPG.Probit` to plot a UPG.Probit object.

Examples

```r
# estimate a probit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.probit = UPG(y = y, X = X, model = "probit")
print(results.probit)
```
program

Students program choices.

Description

A dataset containing the choice among general program, vocational program and academic program for 200 high school students as well as some explanatory variables.

Usage

program

Format

A data frame with 200 rows and 5 variables:

- **program** a vector of program choices
- **intercept** an intercept term
- **female** binary indicator for female students
- **ses** socioeconomic status, 1 is lowest
- **write** writing score of student

Source

Original dataset is known as 'hsbdemo' and has been sourced from [https://stats.oarc.ucla.edu/stat/data/hsbdemo.dta](https://stats.oarc.ucla.edu/stat/data/hsbdemo.dta).

summary.UPG.Binomial

Estimation results and tables for UPG.Binomial objects

Description

summary generates a summary of estimation results for UPG.Binomial objects. Point estimates, estimated standard deviation as well as credible intervals for each variable are tabulated. In addition, an indicator quickly shows whether the credible interval includes zero or not. Moreover, LaTeX, HTML and pandoc tables can be quickly generated via knitr.
summary.UPG.Binomial

Usage

```r
## S3 method for class 'UPG.Binomial'
summary(
  object = NULL,
  ..., 
  q = c(0.025, 0.975), 
  names = NULL, 
  digits = 2, 
  include = NULL, 
  table = NULL, 
  cap = NULL
)
```

Arguments

- `object`: an object of class `UPG.Binomial`.
- `...`: other summary parameters.
- `q`: a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.
- `names`: a character vector indicating names for the variables used in the output.
- `digits`: number of digits to be included in output. Last digit will be rounded using `round`.
- `include`: can be used to summarize and tabulate only a subset of variables. Specify the columns of `X` that should be kept in the plot. See examples for further information.
- `table`: can be used to return a LaTeX table (`'latex'`), a Word table (`'pandoc'`) and HTML tables (`'html'`) via `knitr`. Include package "booktabs" in LaTeX preamble for LaTeX tables.
- `cap`: character vector that can be used to specify the table caption.

Value

Returns a `knitr_kable` object containing the summary table.

Author(s)

Gregor Zens

See Also

`plot.UPG.Binomial` to plot a `UPG.Binomial` object. `predict.UPG.Binomial` to predict probabilities using a `UPG.Binomial` object. `coef.UPG.Binomial` to extract coefficients from a `UPG.Binomial` object.
Examples

```r
# estimate a binomial logit model using example data
library(UPG)
data(titanic)
y = titanic[,1]
Ni = titanic[,2]
X = titanic[,-c(1,2)]
results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial")

# basic summary of regression results
summary(results.binomial)

# generate a LaTeX table with subset of variables and custom names
summary(results.binomial,
        include=c(1,3),
        names=c("V. kept 1", "V. kept 3"),
        table="latex")
```

Description

`summary` generates a summary of estimation results for `UPG.Logit` objects. Point estimates, estimated standard deviation as well as credible intervals for each variable are tabulated. In addition, an indicator quickly shows whether the credible interval includes zero or not. Moreover, LaTeX, HTML and pandoc tables can be quickly generated via `knitr`.

Usage

```r
## S3 method for class 'UPG.Logit'
summary(
  object = NULL,
  ...,
  q = c(0.025, 0.975),
  names = NULL,
  digits = 2,
  include = NULL,
  table = NULL,
  cap = NULL
)
```

Arguments

```
object an object of class UPG.Logit.
... other summary parameters.
```
summary.UPG.Logit

q  a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.

names  a character vector indicating names for the variables used in the output.

digits  number of digits to be included in output. Last digit will be rounded using round.

include  can be used to summarize and tabulate only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.

table  can be used to return a LaTeX table ('latex'), a Word table ('pandoc') and HTML tables ('html') via knitr. Include package "booktabs" in LaTeX preamble for LaTeX tables.

cap  character vector that can be used to specify the table caption.

Value

Returns a knitr_kable object containing the summary table.

Author(s)

Gregor Zens

See Also

plot.UPG.Logit to plot a UPG.Logit object. predict.UPG.Logit to predict probabilities using a UPG.Logit object. coef.UPG.Logit to extract coefficients from a UPG.Logit object.

Examples

# estimate a logit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.logit = UPG(y = y, X = X, model = "logit")

# basic summary of regression results
summary(results.logit)

# generate a LaTeX table with subset of variables and custom names
summary(results.logit,
   include=c(1,3),
   names=c("V. kept 1", "V. kept 3"),
   table="latex")
Description

`summary` generates a summary of estimation results for UPG.MNL objects. Point estimates, estimated standard deviation as well as credible intervals for each variable are tabulated. In addition, an indicator quickly shows whether the credible interval includes zero or not. Moreover, LaTeX, HTML and pandoc tables can be quickly generated via `knitr`.

Usage

```
## S3 method for class 'UPG.MNL'
summary(
  object = NULL,
  ..., q = c(0.025, 0.975),
  groups = NULL,
  names = NULL,
  digits = 2,
  include = NULL,
  table = NULL,
  cap = NULL
)
```

Arguments

- `object` an object of class UPG.MNL.
- `...` other summary parameters.
- `q` a numerical vector of length two providing the posterior quantiles to be extracted. Default are 0.025 and 0.975 quantiles.
- `groups` a character vector indicating names for the groups, excluding the baseline. The group names must correspond to the ordering in the dependent variable used for estimation.
- `names` a character vector indicating names for the variables used in the output.
- `digits` number of digits to be included in output. Last digit will be rounded using `round`.
- `include` can be used to summarize and tabulate only a subset of variables. Specify the columns of X that should be kept in the plot. See examples for further information.
- `table` can be used to return a LaTeX table (`'latex'`), a Word table (`'pandoc'`) and HTML tables (`'html'`) via `knitr`. Include package "booktabs" in LaTeX preamble for LaTeX tables.
- `cap` character vector that can be used to specify the table caption.
summary.UPG.Probit

Value

Returns a \texttt{knitr_kable} object containing the summary table.

         table="latex")

titanic

*Grouped Titanic survival data.*

**Description**

A dataset containing the number of survivals and the total number of persons by passenger class, age group and gender.

**Usage**

titanic

**Format**

A data frame with 78 rows and 6 variables:

- **survived**  number of passengers that survived
- **total**  number of total passengers
- **intercept**  an intercept term
- **pclass**  passenger class (3 is lowest)
- **female**  binary indicator for female passenger groups
- **age.group**  age group indicator (0-5yrs, 5-10yrs, ...)

**Source**

Description

UPG estimates Bayesian regression models for binary or categorical outcomes using samplers based on marginal data augmentation.

Usage

```r
UPG(y, X, model, 
    Ni = NULL, baseline = NULL, draws = 1000, burnin = 1000, 
    A0 = 4, B0 = 4, d0 = 2.5, D0 = 1.5, G0 = 100, 
    verbose = TRUE, gamma.boost = TRUE, delta.boost = TRUE, 
    beta.start = NULL)
```

Arguments

- `y`: a binary vector for probit and logit models. A character, factor or numeric vector for multinomial logit models. A numerical vector of the number of successes for the binomial model.
- `X`: a matrix of explanatory variables including an intercept in the first column. Rows are individuals, columns are variables.
- `model`: indicates the model to be estimated. 'probit' for the probit model, 'logit' for the logit model, 'mnl' for the multinomial logit model or 'binomial' for the binomial logit model.
- `Ni`: a vector containing the number of trials when estimating a binomial logit model.
- `baseline`: a string that can be used to change the baseline category in MNL models. Default baseline is the most commonly observed category.
- `draws`: number of saved Gibbs sampler iterations. Default is 1000 for illustration purposes, you should use more when estimating a model (e.g. 10,000).
- `burnin`: number of burned Gibbs sampler iterations. Default is 1000 for illustration purposes, you should use more when estimating a model (e.g. 2,000).
A0 prior variance for the intercept, 4 is the default.
B0 prior variance for the coefficients, 4 is the default.
d0 prior shape for working parameter delta, 2.5 is the default.
D0 prior rate for working parameter delta, 1.5 is the default.
G0 prior variance for working parameter gamma, 100 is the default.
verbose logical variable indicating whether progress should be printed during estimation.
gamma.boost logical variable indicating whether location-based parameter expansion boosting should be used.
delta.boost logical variable indicating whether scale-based parameter expansion boosting should be used.
beta.start provides starting values for beta (e.g. for use within Gibbs sampler). Baseline coefficients need to be zero for multinomial model.

Value

Depending on the estimated model, UPG() returns a UPG.Probit, UPG.Logit, UPG.MNL or UPG.Binomial object.

Author(s)

Gregor Zens

summary.UPG.Probit to summarize a UPG.Probit object and to create tables. predict.UPG.Logit to predict probabilities using a UPG.Logit object. plot.UPG.MNL to plot a UPG.MNL object.

Examples

# load package
library(UPG)

# estimate a probit model using example data
# warning: use more burn-ins, burnin = 100 is just used for demonstration purposes
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.probit = UPG(y = y, X = X, model = "probit", burnin = 100)

# estimate a logit model using example data
# warning: use more burn-ins, burnin = 100 is just used for demonstration purposes
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.logit = UPG(y = y, X = X, model = "logit", burnin = 100)

# estimate a MNL model using example data
# warning: use more burn-ins, burnin = 100 is just used for demonstration purposes
data(program)
y = program[,1]
X = program[,-1]
results.mnl = UPG(y = y, X = X, model = "mnl", burnin = 100)

# estimate a binomial logit model using example data
# warning: use more burn-ins, burnin = 100 is just used for demonstration purposes
data(titanic)
y = titanic[,1]
Ni = titanic[,2]
X = titanic[,-c(1,2)]
results.binomial = UPG(y = y, X = X, Ni = Ni, model = "binomial", burnin = 100)

UPG.Diag

MCMC Diagnostics for UPG.Probit, UPG.Logit, UPG.MNL and UPG.Binomial objects using coda

Description

UPG.Diag computes a number of MCMC diagnostics based on the Markov chains that are contained in the model output returned by UPG.

Usage

UPG.Diag(object = NULL)

Arguments

object an object of class UPG.Probit, UPG.Logit, UPG.MNL or UPG.Binomial.

Value

Returns a list containing effective sample size, effective sampling rate and inefficiency factors for each coefficient. In addition, maximum, minimum and median of these measures are returned.

Author(s)

Gregor Zens

Examples

# estimate a probit model using example data
library(UPG)
data(lfp)
y = lfp[,1]
X = lfp[,-1]
results.probit = UPG(y = y, X = X, model = "probit")
# compute MCMC diagnostics
UPG.Diag(results.probit)

---

### UPG.Diag.Binomial

**MCMC Diagnostics for UPG.Binomial objects**

**Description**

UPG.Diag.Binomial computes inefficiency factors, effective sample size and effective sampling rate based on the posterior distributions in a UPG.Binomial object.

**Usage**

```r
UPG.Diag.Binomial(object = NULL)
```

**Arguments**

- `object`: an object of class UPG.Binomial.

**Value**

Returns a list containing effective sample size, effective sampling rate and inefficiency factors for each coefficient.

**Author(s)**

Gregor Zens

---

### UPG.Diag.Logit

**MCMC Diagnostics for UPG.Logit objects**

**Description**

UPG.Diag.Logit computes inefficiency factors, effective sample size and effective sampling rate based on the posterior distributions in a UPG.Logit object.

**Usage**

```r
UPG.Diag.Logit(object = NULL)
```

**Arguments**

- `object`: an object of class UPG.Logit.
Value

Returns a list containing effective sample size, effective sampling rate and inefficiency factors for each coefficient.

Author(s)

Gregor Zens

UPG.Diag.MNL

Description

UPG.Diag.MNL computes inefficiency factors, effective sample size and effective sampling rate based on the posterior distributions in a UPG.MNL object.

Usage

UPG.Diag.MNL(object = NULL)

Arguments

object an object of class UPG.MNL.

Value

Returns a list containing effective sample size, effective sampling rate and inefficiency factors for each coefficient.

Author(s)

Gregor Zens

UPG.Diag.Probit

Description

UPG.Diag.Probit computes inefficiency factors, effective sample size and effective sampling rate based on the posterior distributions in a UPG.Probit object.

Usage

UPG.Diag.Probit(object = NULL)
Arguments

`object` an object of class `UPG.Probit`.

Value

Returns a list containing effective sample size, effective sampling rate and inefficiency factors for each coefficient.
