Package ‘aRxiv’

December 6, 2021

Title Interface to the arXiv API

Version 0.6

Date 2021-12-06

Description An interface to the API for 'arXiv',
a repository of electronic preprints for
computer science, mathematics, physics, quantitative biology,
quantitative finance, and statistics.

\begin{tabular}{ll}
  \texttt{arxiv_cats} & \textit{arXiv subject classifications} \\
\end{tabular}

\textbf{Description}

\textit{arXiv subject classifications:} their abbreviations and corresponding descriptions.

\textbf{Usage}

\texttt{data(arxiv_cats)}

\textbf{Format}

A data frame with two columns: the abbreviations of the subject classifications (\texttt{abbreviation}) and the corresponding description (\texttt{description}).

\textbf{Source}

\url{https://arxiv.org/help/api/user-manual}

\textbf{Examples}

\begin{itemize}
  \item \texttt{arxiv_cats}
\end{itemize}

\begin{tabular}{ll}
  \texttt{arxiv_count} & \textit{Count number of results for a given search} \\
\end{tabular}

\textbf{Description}

Count the number of results for a given search. Useful to check before attempting to pull down a very large number of records.

\textbf{Usage}

\texttt{arxiv_count(query = NULL, id_list = NULL)}
Arguments

query Search pattern as a string; a vector of such strings is also allowed, in which case the elements are combined with AND.

id_list arXiv doc IDs, as comma-delimited string or a vector of such strings

Value

Number of results (integer). An attribute "search_info" contains information about the search parameters and the time at which it was performed.

See Also

arxiv_search(), query_terms(), arxiv_cats()

Examples

# count papers in category stat.AP (applied statistics)
arxiv_count(query = "cat:stat.AP")

# count papers by Peter Hall in any stat category
arxiv_count(query = "au:"Peter Hall" AND cat:stat")

# count papers for a range of dates
#  here, everything in 2013
arxiv_count("submittedDate:[2013 TO 2014]"
Details

There is a delay between calls to `utils::browseURL()`, with the amount taken from the R option "aRxiv_delay" (in seconds); if missing, the default is 3 sec.

Value

(Invisibly) Vector of character strings with URLs of abstracts opened.

See Also

`arxiv_search()`

Examples

```r
z <- arxiv_search('au:"Peter Hall" AND ti:deconvolution')
arxiv_open(z)
```

---

### Description

Allows for programmatic searching of the arXiv pre-print repository.

### Usage

```r
arxiv_search(
  query = NULL,
  id_list = NULL,
  start = 0,
  limit = 10,
  sort_by = c("submitted", "updated", "relevance"),
  ascending = TRUE,
  batchsize = 100,
  force = FALSE,
  output_format = c("data.frame", "list"),
  sep = "|"
)
```

### Arguments

- **query**: Search pattern as a string; a vector of such strings also allowed, in which case the elements are combined with AND.
- **id_list**: arXiv doc IDs, as comma-delimited string or a vector of such strings
- **start**: An offset for the start of search
- **limit**: Maximum number of records to return.
sort_by How to sort the results (ignored if id_list is provided)
ascending If TRUE, sort in ascending order; else descending (ignored if id_list is provided)
batchsize Maximum number of records to request at one time
force If TRUE, force search request even if it seems extreme
output_format Indicates whether output should be a data frame or a list.
sep String to use to separate multiple authors, affiliations, DOI links, and categories, in the case that output_format="data.frame".

Value

If output_format="data.frame", the result is a data frame with each row being a manuscript and columns being the various fields.

If output_format="list", the result is a list parsed from the XML output of the search, closer to the raw output from arXiv.

The data frame format has the following columns.

| .[1] | id | arXiv ID |
| .[2] | submitted | date first submitted |
| .[3] | updated | date last updated |
| .[4] | title | manuscript title |
| .[5] | summary | abstract |
| .[6] | authors | author names |
| .[7] | affiliations | author affiliations |
| .[8] | link_abstract | hyperlink to abstract |
| .[9] | link_pdf | hyperlink to pdf |
| .[10] | link_doi | hyperlink to DOI |
| .[11] | comment | authors' comment |
| .[12] | journal_ref | journal reference |
| .[13] | doi | published DOI |
| .[14] | primary_category | primary category |
| .[15] | categories | all categories |

The contents are all strings; missing values are empty strings (" ").

The columns authors, affiliations, link_doi, and categories may have multiple entries separated by sep (by default, "|").

The result includes an attribute "search_info" that includes information about the details of the search parameters, including the time at which it was completed. Another attribute "total_results" is the total number of records that match the query.

arxiv_count(), arxiv_open(), query_terms(), arxiv_cats()
can_arxiv_connect

Description
Check for connection to arXiv API

Usage
can_arxiv_connect(max_time = 5)

Arguments
max_time Maximum wait time in seconds

Value
Returns TRUE if connection is established and FALSE otherwise.

Examples
can_arxiv_connect(2)
Description

Possible terms that correspond to different fields in arXiv searches.

Usage

data(query_terms)

Format

A data frame with two columns: the term and corresponding description.
