Package ‘aRxiv’

February 29, 2024

Title Interface to the arXiv API
Version 0.10
Date 2024-02-29
Description An interface to the API for 'arXiv',
a repository of electronic preprints for
computer science, mathematics, physics, quantitative biology,
quantitative finance, and statistics.
URL https://docs.ropensci.org/aRxiv/,
      https://github.com/ropensci/aRxiv
BugReports https://github.com/ropensci/aRxiv/issues
Depends R (>= 3.5.0)
License MIT + file LICENSE
Imports httr, utils, XML
Suggests devtools, knitr, rmarkdown, roxygen2, testthat
VignetteBuilder knitr
Encoding UTF-8
LazyData true
RoxygenNote 7.3.1
NeedsCompilation no

  arxiv_open ................................................................. 3
  arxiv_search ............................................................... 4
  can_arxiv_connect ......................................................... 6
  query_terms ................................................................. 7
\end{verbatim}

\section*{Index}

\begin{verbatim}
  arxiv_cats
  arXiv subject classifications
\end{verbatim}

\section*{Description}

arXiv subject classifications: their abbreviations and corresponding descriptions.

\section*{Usage}

\begin{verbatim}
data(arxiv_cats)
\end{verbatim}

\section*{Format}

A data frame with five columns: the abbreviations of the subject classifications (category), the field of study, subfield of study (within Physics; NA otherwise), a short description, and a longer description.

\section*{Source}

https://arxiv.org/category_taxonomy

\section*{Examples}

\begin{verbatim}
arxiv_cats
\end{verbatim}

\section*{Count number of results for a given search}

\begin{verbatim}
  arxiv_count
  Count number of results for a given search
\end{verbatim}

\section*{Description}

Count the number of results for a given search. Useful to check before attempting to pull down a very large number of records.

\section*{Usage}

\begin{verbatim}
arxiv_count(query = NULL, id_list = NULL)
\end{verbatim}
Arguments

query    Search pattern as a string; a vector of such strings is also allowed, in which case
          the elements are combined with AND.

id_list  arXiv doc IDs, as comma-delimited string or a vector of such strings

Value

Number of results (integer). An attribute "search_info" contains information about the search
parameters and the time at which it was performed.

See Also

arxiv_search(), query_terms(), arxiv_cats()

Examples

# count papers in category stat.AP (applied statistics)
arxiv_count(query = "cat:stat.AP")

# count papers by Peter Hall in any stat category
arxiv_count(query = 'au:"Peter Hall" AND cat:stat*')

# count papers for a range of dates
# here, everything in 2013
arxiv_count("submittedDate:[2013 TO 2014]")
Details

There is a delay between calls to `utils::browseURL()`, with the amount taken from the R option "arXiv_delay" (in seconds); if missing, the default is 3 sec.

Value

(Invisibly) Vector of character strings with URLs of abstracts opened.

See Also

`arxiv_search()`

Examples

```r
z <- arxiv_search('au:"Peter Hall" AND ti:deconvolution')
arxiv_open(z)
```

---

**Description**

Allows for programmatic searching of the arXiv pre-print repository.

**Usage**

```r
arxiv_search(
  query = NULL,
  id_list = NULL,
  start = 0,
  limit = 10,
  sort_by = c("submitted", "updated", "relevance"),
  ascending = TRUE,
  batchsize = 100,
  force = FALSE,
  output_format = c("data.frame", "list"),
  sep = "|
"
)
```

**Arguments**

- `query` Search pattern as a string; a vector of such strings also allowed, in which case the elements are combined with AND.
- `id_list` arXiv doc IDs, as comma-delimited string or a vector of such strings
- `start` An offset for the start of search
- `limit` Maximum number of records to return.
sort_by
ascending
batchsize
force
output_format
sep

How to sort the results (ignored if id_list is provided)
If TRUE, sort in ascending order; else descending (ignored if id_list is provided)
Maximum number of records to request at one time
If TRUE, force search request even if it seems extreme
Indicates whether output should be a data frame or a list.
String to use to separate multiple authors, affiliations, DOI links, and categories, in the case that output_format="data.frame".

Value
If output_format="data.frame", the result is a data frame with each row being a manuscript and columns being the various fields.
If output_format="list", the result is a list parsed from the XML output of the search, closer to the raw output from arXiv.
The data frame format has the following columns.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[,1]</td>
<td>id</td>
</tr>
<tr>
<td>[,2]</td>
<td>submitted</td>
</tr>
<tr>
<td>[,3]</td>
<td>updated</td>
</tr>
<tr>
<td>[,4]</td>
<td>title</td>
</tr>
<tr>
<td>[,5]</td>
<td>summary</td>
</tr>
<tr>
<td>[,6]</td>
<td>authors</td>
</tr>
<tr>
<td>[,7]</td>
<td>affiliations</td>
</tr>
<tr>
<td>[,8]</td>
<td>link_abstract</td>
</tr>
<tr>
<td>[,9]</td>
<td>link_pdf</td>
</tr>
<tr>
<td>[,10]</td>
<td>link_doi</td>
</tr>
<tr>
<td>[,11]</td>
<td>comment</td>
</tr>
<tr>
<td>[,12]</td>
<td>journal_ref</td>
</tr>
<tr>
<td>[,13]</td>
<td>doi</td>
</tr>
<tr>
<td>[,14]</td>
<td>primary_category</td>
</tr>
<tr>
<td>[,15]</td>
<td>categories</td>
</tr>
</tbody>
</table>

The contents are all strings; missing values are empty strings ("").
The columns authors, affiliations, link_doi, and categories may have multiple entries separated by sep (by default, "").
The result includes an attribute "search_info" that includes information about the details of the search parameters, including the time at which it was completed. Another attribute "total_results" is the total number of records that match the query.

See Also

arxiv_count(), arxiv_open(), query_terms(), arxiv_cats()
Examples

# search for author Peter Hall with deconvolution in title
z <- arxiv_search(query = 'au:"Peter Hall" AND ti:deconvolution', limit=2)
attr(z, "total_results") # total no. records matching query
z$title

# search for a set of documents by arxiv identifiers
z <- arxiv_search(id_list = c("0710.3491v1", "0804.0713v1", "1003.0315v1"))
# can also use a comma-separated string
z <- arxiv_search(id_list = "0710.3491v1,0804.0713v1,1003.0315v1")
# Journal references, if available
z$journal_ref

# search for a range of dates (in this case, one day)
z <- arxiv_search("submittedDate:[199701010000 TO 199701012400]", limit=2)

---

can_arxiv_connect  

Check for connection to arXiv API

Description

Check for connection to arXiv API

Usage

can_arxiv_connect(max_time = 5)

Arguments

max_time  Maximum wait time in seconds

Value

Returns TRUE if connection is established and FALSE otherwise.

Examples

can_arxiv_connect(2)
query_terms

---

<table>
<thead>
<tr>
<th>query_terms</th>
<th>arXiv query field terms</th>
</tr>
</thead>
</table>

**Description**

Possible terms that correspond to different fields in arXiv searches.

**Usage**

data(query_terms)

**Format**

A data frame with two columns: the `term` and corresponding `description`.

**Author(s)**

Karl W Broman

**Source**

**Examples**

query_terms
