## Package ‘allestimates’

January 20, 2021

**Type**  Package  
**Title**  Effect Estimates from All Models  
**Version**  0.2.1  
**Description**  Estimates and plots effect estimates from models with all possible combinations of a list of variables. It can be used for assessing treatment effects in clinical trials or risk factors in bio-medical and epidemiological research. Like Stata command 'confall' (Wang Z (2007) <doi:10.1177/1536867X0700700203> ), ‘allestimates’ calculates and stores all effect estimates, and plots them against p values or Akaike information criterion (AIC) values. It currently has functions for linear regression: all_lm(), logistic and Poisson regression: all_glm() and all_speedglm(), and Cox proportional hazards regression: all_cox().  
**License**  GPL-2  
**Encoding**  UTF-8  
**LazyData**  true  
**Imports**  broom, tibble, ggplot2, speedglm, survival, tidyr, utils, stringr, dplyr  
**Depends**  R (>= 2.10)  
**RoxygenNote**  7.1.1  
**Suggests**  spelling, knitr, rmarkdown  
**VignetteBuilder**  knitr  
**Language**  en-US  
**NeedsCompilation**  no  
**Author**  Zhiqiang Wang [aut, cre]  
**Maintainer**  Zhiqiang Wang <zhiqiang.wang@menzies.edu.au>  
**Repository**  CRAN  
**Date/Publication**  2021-01-20 09:30:02 UTC
Description

To assess treatment effects in clinical trials and risk factors in bio-medical and epidemiological research, we use regression coefficients, odds ratios or hazard ratios as effect estimates. `allestimates` allows users to quickly obtain effect estimates from models with all possible combinations of a list of variables specified by users. `all_lm` for linear regression, `all_glm` for logistic regression, `all_speedglm` using `speedlm` as a faster alternative of `all_glm`, and `all_cox` for Cox Proportional Hazards Models. Users can further use those values in a returned list of results. `all_plot` draws scatter plots with all effect estimate values against p values, as Stata `confall` command (Wang Z (2007) <doi:10.1177/1536867X0700700203>). Those plots divide estimates into four categories:

Details

- positive and significant: left-top quarter
- negative and significant: left-bottom quarter
- positive and non-significant: right-top quarter
- negative and non-significant: right-bottom quarter

`all_plot2` draws multiple plots. Each of those plots indicates whether a specific variable is included or not included in models. Those effect estimates help users better understand confounding effects, uncertainty of their estimates, as well as inappropriately including variables in the models. This is a tool for calculating and exploring effect estimates from all possible models. Interpretation of the results should be in the context of other analyses and biological knowledge.
**Examples**

? all_speedglm  
? all_glm  
? all_cox  
? all_lm  
? all_plot  
? all_plot2

---

**all_cox**

Estimates all possible effect estimates using Cox Proportional Hazards regression models

---

**Description**

Estimates hazard ratios using Proportional Hazards Regression models ("coxph" from `survival` package) from models with all possible combinations of a list of variables.

**Usage**

```
all_cox(crude, xlist, data, na_omit = TRUE, ...)
```

**Arguments**

- **crude**: An object of `formula` for initial model, generally crude model. However, any other variables can also be included here as the initial model. The left-hand side of ~ is the outcome of interest, and the variable on the right-hand side of ~ is the exposure of the interest (either a treatment or a risk factor)
- **xlist**: A vector of a list of variable names.
- **data**: Data frame.
- **na_omit**: Remove all missing values. Default is "na_omit = TRUE".
- ... Further optional arguments.

**Value**

A list of all effect estimates.

**See Also**

`survival`

**Examples**

```
vlist <- c("Age", "Sex", "Married", "BMI", "Education", "Income")
results <- all_cox(crude = "Surv(t0, t1, Endpoint) ~ Diabetes", xlist = vlist, data = diab_df)
results
```
all_glm

Estimates all possible effect estimates using glm

Description

`all_glm` estimates odds ratios or rate ratios using generalized linear models (glm) with all possible combinations of a list of variables (potential confounding factors).

Usage

```r
all_glm(crude, xlist, data, family = "binomial", na_omit = TRUE, ...)
```

Arguments

- **crude**: An object of `formula` for initial model, generally crude model. However, any other variables can also be included here as the initial model.
- **xlist**: A `vector` of a list of variable names (potential confounding factors).
- **data**: `Data frame`.
- **family**: `family` Description of the error distribution. Default is "binomial".
- **na_omit**: Remove all missing values. Default is "na_omit = TRUE".
- **...**: Further optional arguments.

Value

A list of all effect estimates.

See Also

`stats`

Examples

```r
diab_df$Overweight <- as.numeric(diab_df$BMI >= 25)
vlist <- c("Age", "Sex", "Income")
all_glm(crude = "Diabetes ~ Overweight", xlist = vlist, data = diab_df)
```
all_lm

Estimates all possible effect estimates using lm

Description

all_lm estimates coefficients of a specific variable using linear models (lm) with all possible combinations of other variables (potential confounding factors).

Usage

all_lm(crude, xlist, data, na_omit = TRUE, ...)

Arguments

- **crude**: An object of formula for initial model, generally crude model. However, additional variables can also be included here as the initial model.
- **xlist**: A vector of a list of variable names (potential confounding factors).
- **data**: Data frame.
- **na_omit**: Remove all missing values. Default is "na_omit = TRUE".
- **...**: Further optional arguments.

Value

A list of all effect estimates.

See Also

lm

Examples

vlist <- c("Age", "Sex", "Cancer", "CVD", "Education", "Income")
all_lm(crude = "BMI ~ Married", xlist = vlist, data = diab_df)

all_plot

Plot all effect estimates against p values

Description

all_plot() generates a scatter plot with effect estimates of all possible models again p values.
Usage

```r
all_plot(
  data,
  xlabels = c(0, 0.001, 0.01, 0.05, 0.2, 0.5, 1),
  xlim = c(0, 1),
  xlab = "P value",
  ylim = NULL,
  ylab = NULL,
  yscale_log = FALSE,
  title = NULL
)
```

Arguments

- **data**: Object from `all_cox`, `all_glm`, `all_speedglm`, or `all_glm`, including all effect estimate values.
- **xlabels**: Numeric vector x-axis tick labels. Default is "c(0,0.001,0.01,0.05,0.2,0.5,1)".
- **xlim**: Vector of 2 numeric values for x-axis limits. Default is "c(0,1)".
- **xlab**: Character string for x-axis name. Default is "P value".
- **ylim**: Vector of 2 numeric values for y-axis limits.
- **ylab**: Character string for y-axis name. Default depends on original model types.
- **yscale_log**: TRUE or FALSE to re-scale y-axis to "log10". Default is "FALSE".
- **title**: Character for plot title. Default is "NULL".

Value

A ggplot2 object: scatter plot

Examples

```r
vlist <- c("Age", "Sex", "Married", "BMI", "Education", "Income")
results <- all_cox(crude = "Surv(t0, t1, Endpoint) ~ Diabetes", xlist = vlist, data = diab_df)
all_plot(results)
```

---

**all_plot2**

Plots all effect estimates against p values with each specific variable in the models

Description

`all_plot2()` generates a panel of scatter plots with effect estimates of all possible models against p values. Each plot includes effect estimates from all models including a specific variable.
all_plot_aic

Usage

all_plot2(
  data,
  xlabels = c(0, 0.001, 0.01, 0.05, 0.2, 0.5, 1),
  xlim = c(0, 1),
  xlab = "P value",
  ylim = NULL,
  ylab = NULL,
  yscale_log = FALSE,
  title = NULL
)

Arguments

data Object from all_cox, all_glm, all_speedglm, or all_glm, including all effect estimate values.
xlabels numeric vector x-axis tick labels. Default is "c(0,0.001,0.01,0.05,0.2,0.5,1)"
xlim vector of 2 numeric values for x-axis limits. Default is "c(0,1)".
xlab Character string for x-axis name. Default is "P value".
ylim vector of 2 numeric values for y-axis limits.
ylab Character string for y-axis name. Default depends on original model types.
yscale_log TRUE or FALSE re-scale y-axis to "log10". Default is "FALSE".
title Character title. Default is "NULL".

Value

A ggplot2 object: scatter plot

Examples

vlist <- c("Age", "Sex", "Married", "BMI", "Education", "Income")
results <- all_cox(crude = "Surv(t0, t1, Endpoint) ~ Diabetes", xlist = vlist, data = diab_df)
all_plot2(results)

all_plot_aic Draws scatter plot with all effect estimates against AIC

Description

all_plot_aic() generates a scatter plot with all effect estimates against AIC.

Usage

all_plot_aic(data, xlab = "AIC", ylab = NULL, title = NULL)
Arguments

data Object from all_cox, all_glm, all_speedglm, or all_glm, including all effect estimate values.
xlab Character string for x-axis name. Default is "AIC"
ylab Character string for y-axis name. Default depends on original model types.
title Character for plot title. Default is "NULL".

Value

A ggplot2 object: scatter plot.

Examples

vlist <- c("Age", "Sex", "Married", "BMI", "Education", "Income")
results <- all_cox(crude = "Surv(t0, t1, Endpoint) ~ Diabetes", xlist = vlist, data = diab_df)
all_plot_aic(data = results)

all_plot_aic2 Draws multiple scatter plots of all effect estimates against AIC

Description

all_plot_aic2() draws multiple scatter plots of all effect estimates against AIC. Each plot indicates if a specific variable is included in the models.

Usage

all_plot_aic2(data, xlab = "AIC", ylab = NULL, title = NULL)

Arguments

data Object from all_cox, all_glm, all_speedglm, or all_glm, including all effect estimate values.
xlab Character string for x-axis name. Default is "AIC".
ylab Character string for y-axis name. Default depends on original model types.
title Character for plot title. Default is "NULL".

Value

A ggplot2 object: scatter plot.

Examples

vlist <- c("Age", "Sex", "Married", "BMI", "Education", "Income")
results <- all_cox(crude = "Surv(t0, t1, Endpoint) ~ Diabetes", xlist = vlist, data = diab_df)
all_plot_aic(data = results)
all_speedglm

Effect estimates from all possible models using speedglm

Description

This is a faster alternative to all_glm. all_speedglm estimates odds ratios or rate ratios using generalized linear models (speedglm) with all possible combinations of a list of variables (potential confounding factors) specified in xlist argument.

Usage

all_speedglm(crude, xlist, data, family = binomial(), na_omit = TRUE, ...)

Arguments

- **crude**: An object of formula for initial model, generally crude model. However, any other variables can also be included here as the initial model.
- **xlist**: A vector of characters with variable names to be included in as potential confounding factors.
- **data**: Data frame.
- **family**: Description of the error distribution. Default is binomial().
- **na_omit**: Remove all missing values. Default is "na_omit = TRUE".
- **...**: Further optional arguments.

Value

A list of all effect estimates.

See Also

speedglm

Examples

vlist <- c("Age", "Sex", "Married", "Cancer", "CVD", "Education")
results <- all_speedglm(crude = "Endpoint ~ Diabetes", xlist = vlist, data = diab_df)
results$estimate
all_plot(results)
Description

A data frame with 2372 rows and 14 variables with diabetes status diabetes and mortality status endpoint. For the purpose of demonstrate, assume that we are interested in the association between diabetes and endpoint. Other variables are considered as possible confounding factors. The purposes of this dataset is to illustrate those functions in chest and allestimates packages only. Therefore, we assume it is a cohort design for Cox Proportional Hazard regression, and a case-control design for logistic regression.

Usage

diab_df

Format

A data frame with 2372 rows and 14 variables:

- **Diabetes** diabetes status 1: with diabetes 0: without diabetes
- **Endpoint** mortality status 1: reached end point, and 0: survived
- **Age** Age, in years
- **Sex** sex, 1: male, 2: Female
- **BMI** Body mass index
- **Married** marital status 1: married, 0: not
- **Smoke** smoking status 1: smoker, 0: non-smoker
- **CVD** cardiovascular disease 1: yes 0: no
- **Cancer** cancer 1: yes, 0: no
- **Education** education 1: high, 0: low
- **Income** income 1: high, 0: low
- **t0** time (age) at the start of the follow-up
- **t1** time (age) at the end of the follow-up
- **mid** matched set id, for conditional logistic regression
