Package ‘bayesplot’

February 15, 2024

Type Package

Title Plotting for Bayesian Models

Version 1.11.1

Date 2024-02-14

Maintainer Jonah Gabry <jsg2201@columbia.edu>

Description Plotting functions for posterior analysis, MCMC diagnostics, prior and posterior predictive checks, and other visualizations to support the applied Bayesian workflow advocated in Gabry, Simpson, Vehtari, Betancourt, and Gelman (2019) <doi:10.1111/rssb.12378>. The package is designed not only to provide convenient functionality for users, but also a common set of functions that can be easily used by developers working on a variety of R packages for Bayesian modeling, particularly (but not exclusively) packages interfacing with 'Stan'.

bayesplot-package   bayesplot: Plotting for Bayesian Models

Description

Stan Development Team

The bayesplot package provides a variety of ggplot2-based plotting functions for use after fitting Bayesian models (typically, though not exclusively, via Markov chain Monte Carlo). The package is designed not only to provide convenient functionality for users, but also a common set of functions that can be easily used by developers working on a variety of packages for Bayesian modeling, particularly (but not necessarily) packages powered by RStan (the R interface to Stan). Examples of packages that will soon (or already are) using bayesplot are rstan itself, as well as the rstan-dependent rstanarm and brms packages for applied regression modeling.

Plotting functionality

The plotting functions in bayesplot are organized into several modules:

• MCMC: Visualizations of Markov chain Monte Carlo (MCMC) simulations generated by any MCMC algorithm as well as diagnostics. There are also additional functions specifically for use with models fit using the No-U-Turn Sampler (NUTS).

• PPC: Graphical (posterior or prior) predictive checks (PPCs).

• PPD: Plots of (posterior or prior) predictive distributions without comparisons to observed data.

Resources

• Online documentation and vignettes: Visit the bayesplot website at https://mc-stan.org/bayesplot/

• Bug reports and feature requests: If you would like to request a new feature or if you have noticed a bug that needs to be fixed please let us know at the bayesplot issue tracker at https://github.com/stan-dev/bayesplot/issues/

• General questions and help: To ask a question about bayesplot on the Stan Forums forum please visit https://discourse.mc-stan.org.

- `theme_default()` for the default ggplot theme used by `bayesplot` and `bayesplot_theme_set()` to change it.
- `bayesplot-colors` to set or view the color scheme used for plotting.
- `ggplot2::ggsave()` for saving plots.

Examples

# A few quick examples (all of the functions have many examples
# on their individual help pages)

# MCMC plots
x <- example_mcmc_draws(params = 5)
mcmc_intervals(x, prob = 0.5)
mcmc_intervals(x, regex_pars = "beta")

color_scheme_set("purple")
mcmc_areas(x, regex_pars = "beta", prob = 0.8)

color_scheme_set("mix-blue-red")
mcmc_trace(x, pars = c("alpha", "sigma"),
            facet_args = list(nrow = 2))

color_scheme_set("brightblue")
mcmc_scatter(x, pars = c("beta[1]", "sigma"),
             transformations = list(sigma = "log"))

# Graphical PPCs
y <- example_y_data()
yrep <- example_yrep_draws()
ppc_dens_overlay(y, yrep[1:50, ])

color_scheme_set("pink")
ppc_stat(y, yrep, stat = "median") + grid_lines()
ypred <- yrep
ppd_dens_overlay(ypred[1:50, ])
ppd_stat(ypred, stat = "median") + grid_lines()
ppd_hist(ypred[1:8, ])

---

**available_ppc**

Get or view the names of available plotting or data functions

**Description**

Get or view the names of available plotting or data functions

**Usage**

```r
available_ppc(pattern = NULL, fixed = FALSE, invert = FALSE, plots_only = TRUE)
available_ppd(pattern = NULL, fixed = FALSE, invert = FALSE, plots_only = TRUE)
available_mcmc(
  pattern = NULL,
  fixed = FALSE,
  invert = FALSE,
  plots_only = TRUE
)
```

**Arguments**

- `pattern`, `fixed`, `invert`
  Passed to `base::grep()`.
- `plots_only`  
  If TRUE (the default) only plotting functions are searched for. If FALSE then functions that return data for plotting (functions ending in `_data()`) are also included.

**Value**

A possibly empty character vector of function names with several additional attributes (for use by a custom print method). If pattern is missing then the returned object contains the names of all available plotting functions in the MCMC, PPC, or PPD module, depending on which function is called. If pattern is specified then a subset of function names is returned.
Examples

```
available_mcmc()
available_mcmc("nuts")
available_mcmc("rhat|neff")

available_ppc()
available_ppc("grouped")
available_ppc("grouped", invert = TRUE)

available_ppd()
available_ppd("grouped")

# can also see which functions that return data are available
available_ppc(plots_only = FALSE)

# only show the _data functions
available_ppc("_data", plots_only = FALSE)
available_ppd("_data", plots_only = FALSE)
available_mcmc("_data", plots_only = FALSE)
```

Description

Set, get, or view color schemes. Choose from a preset scheme or create a custom scheme. See the Available color schemes section below for a list of available scheme names. The Custom color schemes section describes how to specify a custom scheme.

Usage

```
color_scheme_set(scheme = "blue")
color_scheme_get(scheme = NULL, i = NULL)
color_scheme_view(scheme = NULL)
```

Arguments

```
scheme For color_scheme_set(), either a string naming one of the available color schemes or a character vector of exactly six colors specifying a custom scheme. For color_scheme_get(), scheme can be missing (to get the current color scheme) or a string naming one of the preset schemes. For color_scheme_view(), scheme can be missing (to use the current color scheme) or a character vector containing a subset of the available scheme names. See the Available color schemes section below for a list of available scheme names. The Custom color schemes section describes how to specify a custom scheme.
```
For color_scheme_get(), an optional subset of the integers from 1 (lightest) to 6 (darkest) indicating which of the colors in the scheme to return. If i is not specified then all six colors in the scheme are included.

Value

color_scheme_set() has the side effect of setting the color scheme used for plotting. It also returns (invisibly) a list of the hexadecimal color values used in scheme.
color_scheme_get() returns a list of the hexadecimal color values (without changing the current scheme). If the scheme argument is not specified the returned values correspond to the current color scheme. If the optional argument i is specified then the returned list only contains length(i) elements.
color_scheme_view() returns a ggplot object if only a single scheme is specified and a gtable object if multiple schemes names are specified.

Available color schemes

Currently, the available preset color schemes are:

• "blue","brightblue"
• "gray","darkgray"
• "green"
• "pink"
• "purple"
• "red"
• "teal"
• "yellow"
• "viridis","viridisA","viridisB","viridisC","viridisD","viridisE"
• "mix-x-y", replacing x and y with any two of the scheme names listed above (e.g. "mix-teal-pink", "mix-blue-red", etc.). The order of x and y matters, i.e., the color schemes "mix-blue-red" and "mix-red-blue" are not identical. There is no guarantee that every possible mixed scheme will look good with every possible plot.
• "brewer-x", replacing x with the name of a palette available from RColorBrewer::brewer.pal() (e.g., brewer-PuBuGn).

If you have a suggestion for a new color scheme please let us know via the bayesplot issue tracker.

Custom color schemes

A bayesplot color scheme consists of six colors. To specify a custom color scheme simply pass a character vector containing either the names of six colors or six hexadecimal color values (or a mix of names and hex values). The colors should be in order from lightest to darkest. See the end of the Examples section for a demonstration.

See Also

theme_default() for the default ggplot theme used by bayesplot and bayesplot_theme_set() to change it.
Examples

color_scheme_set("blue")
color_scheme_view()

color_scheme_get()
color_scheme_get(i = c(3, 5)) # 3rd and 5th colors only

color_scheme_get("brightblue")
color_scheme_view("brightblue")

# compare multiple schemes
color_scheme_view(c("pink", "gray", "teal"))
color_scheme_view(c("viridis", "viridisA", "viridisB", "viridisC"))

color_scheme_set("pink")
x <- example_mcmc_draws()
mcmc_intervals(x)

color_scheme_set("teal")
color_scheme_view()
mcmc_intervals(x)

color_scheme_set("red")
mcmc_areas(x, regex_pars = "beta")

color_scheme_set("purple")
color_scheme_view()
y <- example_y_data()
yrep <- example_yrep_draws()
ppc_stat(y, yrep, stat = "mean") + legend_none()

#########################################################################
### Mixing color schemes ###
#########################################################################
color_scheme_set("mix-teal-pink")
ppc_stat(y, yrep, stat = "sd") + legend_none()
mcmc_areas(x, regex_pars = "beta")

#########################################################################
### ColorBrewer scheme ###
#########################################################################
color_scheme_set("brewer-Spectral")
color_scheme_view()
mcmc_trace(x, pars = "sigma")

#########################################################################
### Custom color scheme ###
#########################################################################
orange_scheme <- c("#ffebcc", "#ffe880",
                   "#e67d20", "#e68a00",
                   "#995c00", "#996300")
color_scheme_set(orange_scheme)
bayesplot-extractors

Extract quantities needed for plotting from model objects

Description
Generics and methods for extracting quantities needed for plotting from various types of model objects. Currently methods are provided for stanfit (rstan), CmdStanMCMC (cmdstanr), and stanreg (rstanarm) objects, but adding new methods should be relatively straightforward.

Usage

log_posterior(object, ...)
	nuts_params(object, ...)

rhat(object, ...)

neff_ratio(object, ...)

## S3 method for class 'stanfit'
log_posterior(object, inc_warmup = FALSE, ...)

## S3 method for class 'stanreg'
log_posterior(object, inc_warmup = FALSE, ...)

## S3 method for class 'CmdStanMCMC'
log_posterior(object, inc_warmup = FALSE, ...)

## S3 method for class 'stanfit'
nuts_params(object, pars = NULL, inc_warmup = FALSE, ...)

## S3 method for class 'stanreg'
nuts_params(object, pars = NULL, inc_warmup = FALSE, ...)

## S3 method for class 'list'
nuts_params(object, pars = NULL, ...)

## S3 method for class 'CmdStanMCMC'
nuts_params(object, pars = NULL, ...)

## S3 method for class 'stanfit'

\[
\text{color\_scheme\_view()}
\]

\[
mcmc\_areas(x, \text{regex\_pars} = \text{"alpha"})
\]

\[
mcmc\_dens\_overlay(x)
\]

\[
ppc\_stat(y, yrep, \text{stat} = \text{"var"}) + \text{legend\_none()}
\]
rhat(object, pars = NULL, ...)  
## S3 method for class 'stanreg'
rhat(object, pars = NULL, regex_pars = NULL, ...)

## S3 method for class 'CmdStanMCMC'
rhat(object, pars = NULL, ...)

## S3 method for class 'stanfit'
neff_ratio(object, pars = NULL, ...)

## S3 method for class 'stanreg'
neff_ratio(object, pars = NULL, regex_pars = NULL, ...)

## S3 method for class 'CmdStanMCMC'
neff_ratio(object, pars = NULL, ...)

Arguments

object The object to use.
...
Arguments passed to individual methods.
inc_warmup A logical scalar (defaulting to FALSE) indicating whether to include warmup draws, if applicable.
pars An optional character vector of parameter names. For nuts_params() these will be NUTS sampler parameter names rather than model parameters. If pars is omitted all parameters are included.
regex_pars An optional regular expression to use for parameter selection. Can be specified instead of pars or in addition to pars. When using pars for tidy parameter selection, the regex_pars argument is ignored since select helpers perform a similar function.

Value

log_posterior() methods return a molten data frame (see reshape2::melt()). The data frame should have columns "Iteration" (integer), "Chain" (integer), and "Value" (numeric). See Examples, below.

nuts_params() methods return a molten data frame (see reshape2::melt()). The data frame should have columns "Parameter" (factor), "Iteration" (integer), "Chain" (integer), and "Value" (numeric). See Examples, below.

rhat(), neff_ratio() Methods return (named) vectors.

See Also

MCMC-nuts, MCMC-diagnostics
Examples

```r
## Not run:
library(rstanarm)
fit <- stan_glm(mpg ~ wt, data = mtcars, refresh = 0)

np <- nuts_params(fit)
head(np)
tail(np)

lp <- log_posterior(fit)
head(lp)
tail(lp)

## End(Not run)
```

bayesplot-helpers

Convenience functions for adding or changing plot details

Description

Convenience functions for adding to (and changing details of) ggplot objects (many of the objects
returned by bayesplot functions). See the Examples section, below.

Usage

- `vline_at(v, fun, ..., na.rm = TRUE)`
- `hline_at(v, fun, ..., na.rm = TRUE)`
- `vline_0(..., na.rm = TRUE)`
- `hline_0(..., na.rm = TRUE)`
- `abline_01(..., na.rm = TRUE)`
- `lbub(p, med = TRUE)`
- `legend_move(position = "right")`
- `legend_none()`
- `legend_text(...)`
- `xaxis_title(on = TRUE, ...)`
- `xaxis_text(on = TRUE, ...)`
xaxis_ticks(on = TRUE, ...)  
yaxis_title(on = TRUE, ...)  
yaxis_text(on = TRUE, ...)  
yaxis_ticks(on = TRUE, ...)  
facet_text(on = TRUE, ...)  
facet_bg(on = TRUE, ...)  
panel_bg(on = TRUE, ...)  
plot_bg(on = TRUE, ...)  
grid_lines(color = "gray50", size = 0.2)  
overlay_function(...)  

Arguments

v  
Either a numeric vector specifying the value(s) at which to draw the vertical or horizontal line(s), or an object of any type to use as the first argument to fun.

fun  
A function, or the name of a function, that returns a numeric vector.

...  
For the various vline_, hline_, and abline_ functions, ... is passed to ggplot2::geom_vline(), ggplot2::geom_hline(), and ggplot2::geom_abline(), respectively, to control the appearance of the line(s).

For functions ending in _bg, ... is passed to ggplot2::element_rect().
For functions ending in _text or _title, ... is passed to ggplot2::element_text().
For xaxis_ticks and yaxis_ticks, ... is passed to ggplot2::element_line().
For overlay_function, ... is passed to ggplot2::stat_function().

na.rm  
A logical scalar passed to the appropriate geom (e.g. ggplot2::geom_vline()). The default is TRUE.

p  
The probability mass (in [0,1]) to include in the interval.

med  
Should the median also be included in addition to the lower and upper bounds of the interval?

position  
The position of the legend. Either a numeric vector (of length 2) giving the relative coordinates (between 0 and 1) for the legend, or a string among "right", "left", "top", "bottom". Using position = "none" is also allowed and is equivalent to using legend_none().

on  
For functions modifying ggplot theme elements, set on=FALSE to set the element to ggplot2::element_blank(). For example, facet text can be removed by adding facet_text(on=FALSE), or simply facet_text(FALSE) to a ggplot object. If on=TRUE (the default), then ... can be used to customize the appearance of the theme element.

color, size  
Passed to ggplot2::element_line().
Details

Add vertical, horizontal, and diagonal lines to plots:

- `vline_at()` and `hline_at()` return an object created by either `ggplot2::geom_vline()` or `ggplot2::geom_hline()` that can be added to a ggplot object to draw a vertical or horizontal line (at one or several values). If `fun` is missing then the lines are drawn at the values in `v`. If `fun` is specified then the lines are drawn at the values returned by `fun(v)`.
- `vline_0()` and `hline_0()` are wrappers for `vline_at()` and `hline_at()` with `v = 0` and `fun` missing.
- `abline_01()` is a wrapper for `ggplot2::geom_abline()` with the intercept set to 0 and the slope set to 1.
- `lbub()` returns a function that takes a single argument `x` and returns the lower and upper bounds (lb, ub) of the 100*p% of x, as well as the median (if `med=TRUE`).

Control appearance of facet strips:

- `facet_text()` returns ggplot2 theme objects that can be added to an existing plot (ggplot object) to format the text in facet strips.
- `facet_bg()` can be added to a plot to change the background of the facet strips.

Move legend, remove legend, or style the legend text:

- `legend_move()` and `legend_none()` return a ggplot2 theme object that can be added to an existing plot (ggplot object) in order to change the position of the legend or remove it.
- `legend_text()` works much like `facet_text()` but for the legend.

Control appearance of x-axis and y-axis features:

- `xaxis_title()` and `yaxis_title()` return a ggplot2 theme object that can be added to an existing plot (ggplot object) in order to toggle or format the titles displayed on the x or y axis. (To change the titles themselves use `ggplot2::labs()`.)
- `xaxis_text()` and `yaxis_text()` return a ggplot2 theme object that can be added to an existing plot (ggplot object) in order to toggle or format the text displayed on the x or y axis (e.g. tick labels).
- `xaxis_ticks()` and `yaxis_ticks()` return a ggplot2 theme object that can be added to an existing plot (ggplot object) to change the appearance of the axis tick marks.

Customize plot background:

- `plot_bg()` returns a ggplot2 theme object that can be added to an existing plot (ggplot object) to format the background of the entire plot.
- `panel_bg()` returns a ggplot2 theme object that can be added to an existing plot (ggplot object) to format the background of the just the plotting area.
- `grid_lines()` returns a ggplot2 theme object that can be added to an existing plot (ggplot object) to add grid lines to the plot background.

Superimpose a function on an existing plot:

- `overlay_function()` is a simple wrapper for `ggplot2::stat_function()` but with the `inherit.aes` argument fixed to FALSE. Fixing `inherit.aes=FALSE` will avoid potential errors due to the `ggplot2::aes()`thetic mapping used by certain bayesplot plotting functions.
Value

A `ggplot2` layer or `ggplot2::theme()` object that can be added to existing ggplot objects, like those created by many of the `bayesplot` plotting functions. See the Details section.

See Also

`theme_default()` for the default ggplot theme used by `bayesplot`.

Examples

color_scheme_set("gray")
x <- example_mcmc_draws(chains = 1)

bayesplot_grid

Arrange plots in a grid

Description

The bayesplot_grid function makes it simple to juxtapose plots using common x and/or y axes.

Usage

bayesplot_grid(
   ...
)
bayesplot_grid

plots = list(),
xlim = NULL,
ylim = NULL,
grid_args = list(),
titles = character(),
subtitles = character(),
legends = TRUE,
save_gg_objects = TRUE
)

Arguments

... One or more ggplot objects.
plots A list of ggplot objects. Can be used as an alternative to specifying plot objects via ....
xlim, ylim Optionally, numeric vectors of length 2 specifying lower and upper limits for the axes that will be shared across all plots.
grid_args An optional named list of arguments to pass to gridExtra::arrangeGrob() (nrow, ncol, widths, etc.).
titles, subtitles Optional character vectors of plot titles and subtitles. If specified, titles and subtitles must have length equal to the number of plots specified.
legends If any of the plots have legends should they be displayed? Defaults to TRUE.
save_gg_objects If TRUE, the default, then the ggplot objects specified in ... or via the plots argument are saved in a list in the "bayesplots" component of the returned object. Setting this to FALSE will make the returned object smaller but these individual plot objects will not be available.

Value

An object of class "bayesplot_grid" (essentially a gtable object from gridExtra::arrangeGrob()), which has a plot method.

Examples

y <- example_y_data()
yrep <- example_yrep_draws()
stats <- c("sd", "median", "max", "min")

color_scheme_set("pink")
bayesplot_grid(
  plots = lapply(stats, function(s) ppc_stat(y, yrep, stat = s)),
titles = stats,
legends = FALSE,
grid_args = list(ncol = 1)
)

## Not run:
```r
library(rstanarm)
mtcars$log_mpg <- log(mtcars$mpg)
fit1 <- stan_glm(mpg ~ wt, data = mtcars, refresh = 0)
fit2 <- stan_glm(log_mpg ~ wt, data = mtcars, refresh = 0)

y <- mtcars$mpg
yrep1 <- posterior_predict(fit1, draws = 50)
yrep2 <- posterior_predict(fit2, fun = exp, draws = 50)

color_scheme_set("blue")
ppc1 <- ppc_dens_overlay(y, yrep1)
ppc1
ppc1 + yaxis_text()

color_scheme_set("red")
ppc2 <- ppc_dens_overlay(y, yrep2)
bayesplot_grid(ppc1, ppc2)

# make sure the plots use the same limits for the axes
bayesplot_grid(ppc1, ppc2, xlim = c(-5, 60), ylim = c(0, 0.2))

# remove the legends and add text
bayesplot_grid(ppc1, ppc2, xlim = c(-5, 60), ylim = c(0, 0.2),
               legends = FALSE, subtitles = rep("Predicted MPG", 2))

## End(Not run)
```

---

**bayesplot_theme_get**  
Get, set, and modify the active bayesplot theme

**Description**

These functions are the bayesplot equivalent to ggplot2’s `ggplot2::theme_set()` and friends. They set, get, and update the active theme but only apply them to bayesplots. The current/active theme is automatically applied to every bayesplot you draw.

Use `bayesplot_theme_get()` to get the current bayesplot theme and `bayesplot_theme_set()` to set a new theme. `bayesplot_theme_update()` and `bayesplot_theme_replace()` are shorthands for changing individual elements.

**Usage**

```r
bayesplot_theme_get()

bayesplot_theme_set(new = theme_default())

bayesplot_theme_update(...)

bayesplot_theme_replace(...)
```
Arguments

new: The new theme (list of theme elements) to use. This is analogous to the new argument to `ggplot2::theme_set()`.

...: A named list of theme settings.

Details

`bayesplot_theme_set()` and friends only apply to `bayesplots`. However, `ggplot2::theme_set()` can also be used to change the `bayesplot` theme. Currently, setting a theme with `ggplot2::theme_set()` (other than the `ggplot2` default `ggplot2::theme_grey()`) will override the `bayesplot` theme.

Value

`bayesplot_theme_get()` returns the current theme. The other three functions (set, update, replace) invisibly return the previous theme so it can be saved and easily restored later. This is the same behavior as the `ggplot2` versions of these functions.

See Also

`theme_default()` for the default `bayesplot` theme.

`bayesplot-helpers` for a variety of convenience functions, many of which provide shortcuts for tweaking theme elements after creating a plot.

`bayesplot-colors` to set or view the color scheme used for plotting.

Examples

```r
library(ggplot2)

# plot using the current value of bayesplot_theme_get()
# (the default is bayesplot::theme_default())
x <- example_mcmc_draws()
mcmc_hist(x)

# change the bayesplot theme to theme_minimal and save the old theme
old <- bayesplot_theme_set(theme_minimal())
mcmc_hist(x)

# change back to the previous theme
bayesplot_theme_set(old)
mcmc_hist(x)

# change the default font size and family for bayesplots
bayesplot_theme_update(text = element_text(size = 16, family = "sans"))
mcmc_hist(x)

# change back to the default
bayesplot_theme_set() # same as bayesplot_theme_set(theme_default())
mcmc_hist(x)

# updating theme elements
```
```r
color_scheme_set("brightblue")
bayesplot_theme_set(theme_dark())
mcmc_hist(x)

bayesplot_theme_update(panel.background = element_rect(fill = "black"))
mcmc_hist(x)

# to get the same plot without updating the theme we could also have
# used the bayeplot convenience function panel_bg()
bayesplot_theme_set(theme_dark())
mcmc_hist(x) + panel_bg(fill = "black")

# reset
bayesplot_theme_set()
```

---

**MCMC-combos**

**Combination plots**

**Description**

Combination plots

**Usage**

```r
mcmc_combo(x, combo = c("dens", "trace"), ..., widths = NULL, gg_theme = NULL)
```

**Arguments**

- `x` An object containing MCMC draws:
  - A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.
  - A draws object from the `posterior` package (e.g., `draws_array`, `draws_rvars`, etc.).
  - An object with an `as.array()` method that returns the same kind of 3-D array described on the MCMC-overview page.

- `combo` A character vector with at least two elements. Each element of combo corresponds to a column in the resulting graphic and should be the name of one of the available MCMC functions (omitting the `mcmc_` prefix).

- `...` Arguments passed to the plotting functions named in combo.

- `widths` A numeric vector the same length as combo specifying relative column widths. For example, if the plot has two columns, then `widths = c(2, 1)` will allocate more space for the first column by a factor of 2 (as would `widths = c(1.3, .15)`, etc.). The default, NULL, allocates the same horizontal space for each column.
Unlike most of the other `bayesplot` functions, `mcmc_combo` returns a `gtable` object rather than a `ggplot` object, and so theme objects can’t be added directly to the returned plot object. The `gg_theme` argument helps get around this problem by accepting a `ggplot2` theme object that is added to each of the plots before combining them into the `gtable` object that is returned. This can be a theme object created by a call to `ggplot2::theme()` or one of the `bayesplot` convenience functions, e.g. `legend_none()` (see the Examples section, below).

**Value**

A `gtable` object (the result of calling `gridExtra::arrangeGrob()`) with `length(combo)` columns and a row for each parameter.

**See Also**

- Other MCMC: `MCMC-diagnostics`, `MCMC-distributions`, `MCMC-intervals`, `MCMC-nuts`, `MCMC-overview`, `MCMC-parcoord`, `MCMC-recover`, `MCMC-scatterplots`, `MCMC-traces`

**Examples**

```r
# some parameter draws to use for demonstration
x <- example_mcmc_draws()
dim(x)
dimnames(x)

mcmc_combo(x, pars = c("alpha", "sigma"))
mcmc_combo(x, pars = c("alpha", "sigma"), widths = c(1, 2))

# change second plot, show log(sigma) instead of sigma, # and remove the legends
color_scheme_set("mix-blue-red")
mcmc_combo(
  x, 
  combo = c("dens_overlay", "trace"),
  pars = c("alpha", "sigma"),
  transformations = list(sigma = "log"),
  gg_theme = legend_none()
)

# same thing but this time also change the entire ggplot theme
mcmc_combo(
  x, 
  combo = c("dens_overlay", "trace"),
  pars = c("alpha", "sigma"),
  transformations = list(sigma = "log"),
  gg_theme = ggplot2::theme_gray() + legend_none()
)
```
Description

Plots of Rhat statistics, ratios of effective sample size to total sample size, and autocorrelation of MCMC draws. See the Plot Descriptions section, below, for details. For models fit using the No-U-Turn-Sampler, see also MCMC-nuts for additional MCMC diagnostic plots.

Usage

mcmc_rhat(rhat, ..., size = NULL)
mcmc_rhat_hist(rhat, ..., binwidth = NULL, bins = NULL, breaks = NULL)
mcmc_rhat_data(rhat, ...)
mcmc_neff(ratio, ..., size = NULL)
mcmc_neff_hist(ratio, ..., binwidth = NULL, bins = NULL, breaks = NULL)
mcmc_neff_data(ratio, ...)
mcmc_acf(
  x,
  pars = character(),
  regex_pars = character(),
  ..., 
  facet_args = list(),
  lags = 20,
  size = NULL)

mcmc_acf_bar(
  x,
  pars = character(),
  regex_pars = character(),
  ..., 
  facet_args = list(),
  lags = 20
)

Arguments

rhat A vector of R-hat estimates.
... Currently ignored.
**MCMC-diagnostics**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>Optional values to override <code>ggplot2::geom_point()</code>'s default size (for <code>mcmc_rhat()</code>), <code>mcmc_neff()</code> or <code>ggplot2::geom_line()</code>'s default line width (for <code>mcmc_acf()</code>).</td>
</tr>
<tr>
<td>binwidth</td>
<td>Passed to <code>ggplot2::geom_histogram()</code> to override the default binwidth.</td>
</tr>
<tr>
<td>bins</td>
<td>Passed to <code>ggplot2::geom_histogram()</code> to override the default binwidth.</td>
</tr>
<tr>
<td>breaks</td>
<td>Passed to <code>ggplot2::geom_histogram()</code> as an alternative to binwidth.</td>
</tr>
<tr>
<td>ratio</td>
<td>A vector of ratios of effective sample size estimates to total sample size. See <code>neff_ratio()</code>.</td>
</tr>
<tr>
<td>x</td>
<td>An object containing MCMC draws:</td>
</tr>
<tr>
<td></td>
<td>• A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.</td>

<tr>
<td>pars</td>
<td>An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified then the default is to use all parameters. As of version 1.7.0, <code>bayesplot</code> also supports 'tidy' parameter selection by specifying <code>pars = vars(...)</code>, where <code>...</code> is specified the same way as in <code>dplyr::select(...)</code> and similar functions. Examples of using <code>pars</code> in this way can be found on the Tidy parameter selection page.</td>
</tr>
<tr>
<td>regex_pars</td>
<td>An optional regular expression to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code>. When using <code>pars</code> for tidy parameter selection, the <code>regex_pars</code> argument is ignored since <code>select</code> helpers perform a similar function.</td>
</tr>
<tr>
<td>facet_args</td>
<td>A named list of arguments (other than facets) passed to <code>ggplot2::facet_wrap()</code> or <code>ggplot2::facet_grid()</code> to control faceting. Note: if <code>scales</code> is not included in <code>facet_args</code> then <code>bayesplot</code> may use <code>scales=&quot;free&quot;</code> as the default (depending on the plot) instead of the <code>ggplot2</code> default of <code>scales=&quot;fixed&quot;</code>.</td>
</tr>
<tr>
<td>lags</td>
<td>The number of lags to show in the autocorrelation plot.</td>
</tr>
</tbody>
</table>

**Value**

The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

**Plot Descriptions**

`mcmc_rhat()`, `mcmc_rhat_hist()` Rhat values as either points or a histogram. Values are colored using different shades (lighter is better). The chosen thresholds are somewhat arbitrary, but can be useful guidelines in practice.

- **light**: below 1.05 (good)
- **mid**: between 1.05 and 1.1 (ok)
- **dark**: above 1.1 (too high)
mcmc_neff(), mcmc_neff_hist() Ratios of effective sample size to total sample size as either points or a histogram. Values are colored using different shades (lighter is better). The chosen thresholds are somewhat arbitrary, but can be useful guidelines in practice.

- **light**: between 0.5 and 1 (high)
- **mid**: between 0.1 and 0.5 (good)
- **dark**: below 0.1 (low)

mcmc_acf(), mcmc_acf_bar() Grid of autocorrelation plots by chain and parameter. The lags argument gives the maximum number of lags at which to calculate the autocorrelation function. mcmc_acf() is a line plot whereas mcmc_acf_bar() is a barplot.

Other MCMC: MCMC-combos, MCMC-distributions, MCMC-intervals, MCMC-nuts, MCMC-overview, MCMC-parcoord, MCMC-recover, MCMC-scatterplots, MCMC-traces

**Examples**

```r
# autocorrelation
x <- example_mcmc_draws()
dim(x)
dimnames(x)

color_scheme_set("green")
mcmc_acf(x, pars = c("alpha", "beta[1]")

color_scheme_set("pink")
(p <- mcmc_acf_bar(x, pars = c("alpha", "beta[1]")))  

# add horizontal dashed line at 0.5
p + hline_at(0.5, linetype = 2, size = 0.15, color = "gray")

# fake rhat values to use for demonstration
rhat <- c(runif(100, 1, 1.15))
mcmc_rhat_hist(rhat)
mcmc_rhat(rhat)

# lollipops
color_scheme_set("purple")
```

MCMC-distributions

Histograms and kernel density plots of MCMC draws

Description

Various types of histograms and kernel density plots of MCMC draws. See the Plot Descriptions section, below, for details.
Usage

mcmc_hist(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE,
  alpha = 1
)

mcmc_dens(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ..., 
  facet_args = list(),
  trim = FALSE,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL,
  alpha = 1
)

mcmc_hist_by_chain(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  freq = TRUE,
  alpha = 1
)

mcmc_dens_overlay(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
mcmc_dens_chains(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  color_chains = TRUE,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)

mcmc_dens_chains_data(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)

mcmc_violin(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  facet_args = list(),
  probs = c(0.1, 0.5, 0.9)
)

Arguments

x An object containing MCMC draws:
- A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.
- A draws object from the posterior package (e.g., draws_array, draws_rvars, etc.).
- An object with an as.array() method that returns the same kind of 3-D array described on the MCMC-overview page.

pars

An optional character vector of parameter names. If neither pars nor regex_pars is specified then the default is to use all parameters. As of version 1.7.0, bayesplot also supports 'tidy' parameter selection by specifying pars = vars(...), where ... is specified the same way as in dplyr::select(...) and similar functions. Examples of using pars in this way can be found on the Tidy parameter selection page.

regex_pars

An optional regular expression to use for parameter selection. Can be specified instead of pars or in addition to pars. When using pars for tidy parameter selection, the regex_pars argument is ignored since select helpers perform a similar function.

transformations

Optionally, transformations to apply to parameters before plotting. If transformations is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the transformations argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If transformations is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via match.fun(), e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or function(x) log(x)) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., transform).

... Currently ignored.

facet_args

A named list of arguments (other than facets) passed to ggplot2::facet_wrap() or ggplot2::facet_grid() to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the ggplot2 default of scales="fixed".

binwidth

Passed to ggplot2::geom_histogram() to override the default binwidth.

bins

Passed to ggplot2::geom_histogram() to override the default binwidth.

breaks

Passed to ggplot2::geom_histogram() as an alternative to binwidth.

freq

For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the yaxis_text() convenience function.)
alpha Passed to the geom to control the transparency.
trim A logical scalar passed to \texttt{ggplot2::geom_density()}. bw, adjust, kernel, n\_dens Optional arguments passed to \texttt{stats::density()} to override default kernel density estimation parameters. n\_dens defaults to 1024.

color\_chains Option for whether to separately color chains.
probs A numeric vector passed to \texttt{ggplot2::geom_violin()}'s draw\_quantiles argument to specify at which quantiles to draw horizontal lines. Set to \texttt{NULL} to remove the lines.

\textbf{Value}

A \texttt{ggplot} object that can be further customized using the \texttt{ggplot2} package.

\textbf{Plot Descriptions}

\texttt{mcmc\_hist()} Histograms of posterior draws with all chains merged.
\texttt{mcmc\_dens()} Kernel density plots of posterior draws with all chains merged.
\texttt{mcmc\_hist\_by\_chain()} Histograms of posterior draws with chains separated via faceting.
\texttt{mcmc\_dens\_overlay()} Kernel density plots of posterior draws with chains separated but overlaid on a single plot.
\texttt{mcmc\_violin()} The density estimate of each chain is plotted as a violin with horizontal lines at notable quantiles.
\texttt{mcmc\_dens\_chains()} Ridgeline kernel density plots of posterior draws with chains separated but overlaid on a single plot. In \texttt{mcmc\_dens\_overlay()} parameters appear in separate facets; in \texttt{mcmc\_dens\_chains()} they appear in the same panel and can overlap vertically.

\textbf{See Also}

Other MCMC: \texttt{MCMC-combos, MCMC-diagnostics, MCMC-intervals, MCMC-nuts, MCMC-overview, MCMC-parcoord, MCMC-recover, MCMC-scatterplots, MCMC-traces}

\textbf{Examples}

```r
set.seed(9262017)
# some parameter draws to use for demonstration
x <- example_mcmc_draws()
dim(x)
dimnames(x)

###################
### Histograms ###
###################

# histograms of all parameters
color_scheme_set("brightblue")
mcmc_hist(x)
```
# histograms of some parameters
color_scheme_set("pink")
mcmc_hist(x, pars = "alpha", "beta[2]")
mcmc_hist(x, pars = "sigma", regex_pars = "beta")

# example of using 'transformations' argument to plot log(sigma),
# and parsing facet labels (e.g. to get greek letters for parameters)
mcmc_hist(x, transformations = list(sigma = "log"),
    facet_args = list(labeler = ggplot2::label_parsed)) +
    facet_text(size = 15)

# instead of list(sigma = "log"), you could specify the transformation as
# list(sigma = log) or list(sigma = function(x) log(x)), but then the
# label for the transformed sigma is 't(sigma)' instead of 'log(sigma)'
mcmc_hist(x, transformations = list(sigma = log))

# separate histograms by chain
color_scheme_set("pink")
mcmc_hist_by_chain(x, regex_pars = "beta")

##########################################################
### Densities ###
##########################################################
mcmc_dens(x, pars = "sigma", "beta[2]",
    facet_args = list(nrow = 2))

# separate and overlay chains
color_scheme_set("mix-teal-pink")
mcmc_dens_overlay(x, pars = "sigma", "beta[2]",
    facet_args = list(nrow = 2)) +
    facet_text(size = 14)
x2 <- example_mcmc_draws(params = 6)
mcmc_dens_chains(x2, pars = "beta[1]", "beta[2]", "beta[3]")

# separate chains as violin plots
color_scheme_set("green")
mcmc_violin(x) + panel_bg(color = "gray20", size = 2, fill = "gray30")

---

MCMC-intervals

Plot interval estimates from MCMC draws

Description

Plot central (quantile-based) posterior interval estimates from MCMC draws. See the Plot Descriptions section, below, for details.
Usage

mcmc_intervals(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  prob = 0.5,
  prob_outer = 0.9,
  point_est = c("median", "mean", "none"),
  outer_size = 0.5,
  inner_size = 2,
  point_size = 4,
  rhat = numeric()
)

mcmc_areas(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  area_method = c("equal area", "equal height", "scaled height"),
  prob = 0.5,
  prob_outer = 1,
  point_est = c("median", "mean", "none"),
  rhat = numeric(),
  border_size = NULL,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)

mcmc_areas_ridges(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  prob_outer = 1,
  prob = 1,
  border_size = NULL,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)
mcmc_intervals_data(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  prob = 0.5,
  prob_outer = 0.9,
  point_est = c("median", "mean", "none"),
  rhat = numeric()
)

mcmc_areas_data(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  prob = 0.5,
  prob_outer = 1,
  point_est = c("median", "mean", "none"),
  rhat = numeric(),
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)

mcmc_areas_ridges_data(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...
  prob_outer = 1,
  prob = 1,
  bw = NULL,
  adjust = NULL,
  kernel = NULL,
  n_dens = NULL
)

**Arguments**

- **x** An object containing MCMC draws:
  - A 3-D array, matrix, list of matrices, or data frame. The **MCMC-overview** page provides details on how to specify each these.
MCMC-intervals

- A draws object from the **posterior** package (e.g., `draws_array`, `draws_rvars`, etc.).
- An object with an `as.array()` method that returns the same kind of 3-D array described on the MCMC-overview page.

**pars**

An optional character vector of parameter names. If neither `pars` nor `regex_pars` is specified then the default is to use all parameters. As of version 1.7.0, **bayesplot** also supports 'tidy' parameter selection by specifying `pars = vars(...)`, where `...` is specified the same way as in `dplyr::select(...)` and similar functions. Examples of using `pars` in this way can be found on the Tidy parameter selection page.

**regex_pars**

An optional regular expression to use for parameter selection. Can be specified instead of `pars` or in addition to `pars`. When using `pars` for tidy parameter selection, the `regex_pars` argument is ignored since select helpers perform a similar function.

**transformations**

Optionally, transformations to apply to parameters before plotting. If `transformations` is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the `transformations` argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If `transformations` is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via `match.fun()`, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or `function(x) log(x)`) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching `transformations` can be abbreviated for convenience in interactive use (e.g., `transform`).

... Currently unused.

**prob**

The probability mass to include in the inner interval (for `mcmc_intervals()`) or in the shaded region (for `mcmc_areas()`). The default is 0.5 (50% interval) and 1 for `mcmc_areas_ridges()`.

**prob_outer**

The probability mass to include in the outer interval. The default is 0.9 for `mcmc_intervals()` (90% interval) and 1 for `mcmc_areas()` and for `mcmc_areas_ridges()`.

**point_est**

The point estimate to show. Either "median" (the default), "mean", or "none".

**inner_size, outer_size**

For `mcmc_intervals()`, the size of the inner and interval segments, respectively.

**point_size**

For `mcmc_intervals()`, the size of point estimate.

**rhat**

An optional numeric vector of R-hat estimates, with one element per parameter included in `x`. If `rhat` is provided, the intervals/areas and point estimates in the resulting plot are colored based on R-hat value. See `rhat()` for methods for extracting R-hat estimates.
area_method  How to constrain the areas in mcmc_areas(). The default is "equal area", setting the density curves to have the same area. With "equal height", the curves are scaled so that the highest points across the curves are the same height. The method "scaled height" tries a compromise between the two: the heights from "equal height" are scaled using \( \text{height} \times \sqrt{\text{height}} \)

border_size  For mcmc_areas() and mcmc_areas_ridges(), the size of the ridgelines.

bw, adjust, kernel, n_dens  Optional arguments passed to stats::density() to override default kernel density estimation parameters. n_dens defaults to 1024.

### Value

The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.

### Plot Descriptions

- mcmc_intervals()  Plots of uncertainty intervals computed from posterior draws with all chains merged.
- mcmc_areas()  Density plots computed from posterior draws with all chains merged, with uncertainty intervals shown as shaded areas under the curves.
- mcmc_areas_ridges()  Density plot, as in mcmc_areas(), but drawn with overlapping ridgelines. This plot provides a compact display of (hierarchically) related distributions.

### MCMC-nuts

**Diagnostic plots for the No-U-Turn-Sampler (NUTS)**

#### Description

Diagnostic plots for the No-U-Turn-Sampler (NUTS), the default MCMC algorithm used by Stan. See the Plot Descriptions section, below.

#### Usage

- `mcmc_nuts_acceptance(x, lp, chain = NULL, ...)`
- `mcmc_nuts_divergence(x, lp, chain = NULL, ...)`
- `mcmc_nuts_stepsize(x, lp, chain = NULL, ...)`
- `mcmc_nuts_treedepth(x, lp, chain = NULL, ...)`
- `mcmc_nuts_energy(x, ..., binwidth = NULL, bins = NULL, breaks = NULL, alpha = 0.5, merge_chains = FALSE)`
Arguments

- **x**: A molten data frame of NUTS sampler parameters, either created by `nuts_params()` or in the same form as the object returned by `nuts_params()`.
- **lp**: A molten data frame of draws of the log-posterior or, more commonly, of a quantity equal to the log-posterior up to a constant. `lp` should either be created via `log_posterior()` or be an object with the same form as the object returned by `log_posterior()`.
- **chain**: A positive integer for selecting a particular chain. The default (NULL) is to merge the chains before plotting. If `chain = k` then the plot for chain `k` is overlaid (in a darker shade but with transparency) on top of the plot for all chains. The chain argument is not used by `mcmc_nuts_energy()`.
- **...**: Currently ignored.
- **binwidth**: Passed to `ggplot2::geom_histogram()` to override the default binwidth.
- **bins**: Passed to `ggplot2::geom_histogram()` to override the default binwidth.
- **breaks**: Passed to `ggplot2::geom_histogram()` as an alternative to `binwidth`.
- **alpha**: For `mcmc_nuts_energy()` only, the transparency (alpha) level in $[0,1]$ used for the overlaid histogram.
- **merge_chains**: For `mcmc_nuts_energy()` only, should all chains be merged or displayed separately? The default is `FALSE`, i.e., to show the chains separately.

Value

A gtable object (the result of calling `gridExtra::arrangeGrob()` created from several ggplot objects, except for `mcmc_nuts_energy()` which returns a ggplot object.

Quick Definitions

For more details see Stan Development Team (2016) and Betancourt (2017).

- **accept_stat__**: the average acceptance probabilities of all possible samples in the proposed tree.
- **divergent__**: the number of leapfrog transitions with diverging error. Because NUTS terminates at the first divergence this will be either 0 or 1 for each iteration.
- **stepsize__**: the step size used by NUTS in its Hamiltonian simulation.
- **treedepth__**: the depth of tree used by NUTS, which is the log (base 2) of the number of leapfrog steps taken during the Hamiltonian simulation.
- **energy__**: the value of the Hamiltonian (up to an additive constant) at each iteration.

Plot Descriptions

`mcmc_nuts_acceptance()` Three plots:

- Histogram of `accept_stat__` with vertical lines indicating the mean (solid line) and median (dashed line).
- Histogram of `lp__` with vertical lines indicating the mean (solid line) and median (dashed line).
- Scatterplot of accept_stat__ vs lp__.

\texttt{mcmc_nuts_divergence()} Two plots:
- Violin plots of lp__|divergent__=1 and lp__|divergent__=0.
- Violin plots of accept_stat__|divergent__=1 and accept_stat__|divergent__=0.

\texttt{mcmc_nuts_stepsize()} Two plots:
- Violin plots of lp__ by chain ordered by stepsize__ value.
- Violin plots of accept_stat__ by chain ordered by stepsize__ value.

\texttt{mcmc_nuts_treedepth()} Three plots:
- Violin plots of lp__ by value of treedepth__.
- Violin plots of accept_stat__ by value of treedepth__.
- Histogram of treedepth__.

\texttt{mcmc_nuts_energy()} Overlaid histograms showing energy__ vs the change in energy__. See Betancourt (2016) for details.

**MCMC-overview**

### Plots for Markov chain Monte Carlo simulations

**Description**

The bayesplot MCMC module provides various plotting functions for creating graphical displays of Markov chain Monte Carlo (MCMC) simulations. The MCMC plotting functions section, below, provides links to the documentation for various categories of MCMC plots. Currently the MCMC plotting functions accept posterior draws provided in one of the following formats:

- **3-D array**: An array with dimensions Iteration, Chain, Parameter in that order.
- **list**: A list of matrices, where each matrix corresponds to a Markov chain. All of the matrices should have the same number of iterations (rows) and parameters (columns), and parameters should have the same names and be in the same order.
- **matrix (2-D array)**: A matrix with one column per parameter. If using matrix there should only be a single Markov chain or all chains should already be merged (stacked).
- **data frame**: There are two types of data frames allowed. Either a data frame with one column per parameter (if only a single chain or all chains have already been merged), or a data frame with one column per parameter plus an additional column "Chain" that contains the chain number (an integer) corresponding to each row in the data frame.
• **draws**: Any of the draws formats supported by the `posterior` package.

**Note**: typically the user should not include warmup iterations in the object passed to `bayesplot` plotting functions, although for certain plots (e.g. trace plots) it can occasionally be useful to include the warmup iterations for diagnostic purposes.

**MCMC plotting functions**

- **Posterior distributions**: Histograms and kernel density plots of parameter draws, optionally showing each Markov chain separately.
- **Uncertainty intervals**: Uncertainty intervals computed from parameter draws.
- **Trace plots**: Times series of parameter draws, optionally including HMC/NUTS diagnostic information.
- **Scatterplots**: Scatterplots, heatmaps, and pairs plots of parameter draws, optionally including HMC/NUTS diagnostic information.
- **Parallel coordinates plots**: Parallel coordinates plot of MCMC draws (one dimension per parameter), optionally including HMC/NUTS diagnostic information.
- **Combos**: Combination plots (e.g. trace plot + histogram).
- **General MCMC diagnostics**: MCMC diagnostic plots including R-hat, effective sample size, autocorrelation. **NUTS diagnostics**: Special diagnostic plots for the No-U-Turn Sampler.
- **Comparisons to "true" values**: Plots comparing MCMC estimates to "true" parameter values (e.g., values used to simulate data).

Other MCMC: `MCMC-combos`, `MCMC-diagnostics`, `MCMC-distributions`, `MCMC-intervals`, `MCMC-nuts`, `MCMC-parcoord`, `MCMC-recover`, `MCMC-scatterplots`, `MCMC-traces`

**Description**

Parallel coordinates plot of MCMC draws (one dimension per parameter). See the **Plot Descriptions** section below for details, and see Gabry et al. (2019) for more background and a real example.
 Usage

```r
mcmc_parcoord(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  size = 0.2,
  alpha = 0.3,
  np = NULL,
  np_style = parcoord_style_np()
)
```

```r
mcmc_parcoord_data(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  np = NULL
)
```

```r
parcoord_style_np(div_color = "red", div_size = 0.2, div_alpha = 0.2)
```

 Arguments

- **x**: An object containing MCMC draws:
  - A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.
  - A draws object from the posterior package (e.g., draws_array, draws_rvars, etc.).
  - An object with an as.array() method that returns the same kind of 3-D array described on the MCMC-overview page.

- **pars**: An optional character vector of parameter names. If neither pars nor regex_pars is specified then the default is to use all parameters. As of version 1.7.0, bayesplot also supports 'tidy' parameter selection by specifying pars = vars(...), where ... is specified the same way as in dplyr::select(...) and similar functions. Examples of using pars in this way can be found on the Tidy parameter selection page.

- **regex_pars**: An optional regular expression to use for parameter selection. Can be specified instead of pars or in addition to pars. When using pars for tidy parameter selection, the regex_pars argument is ignored since select helpers perform a similar function.

- **transformations**: Optionally, transformations to apply to parameters before plotting. If transformations is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the transformations argument can be a named list with length equal to the
number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If `transformations` is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via `match.fun()`), e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. `log` or `function(x) log(x)`), then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching `transformations` can be abbreviated for convenience in interactive use (e.g., `transform`).

Arguments passed on to `ggplot2::geom_line()`.

For models fit using NUTS (more generally, any symplectic integrator), an optional data frame providing NUTS diagnostic information. The data frame should be the object returned by `nuts_params()` or one with the same structure.

A call to the `parcoord_style_np()` helper function to specify arguments controlling the appearance of superimposed lines representing NUTS diagnostics (in this case divergences) if the `np` argument is specified.

Optional arguments to the `parcoord_style_np()` helper function that are eventually passed to `ggplot2::geom_line()` if the `np` argument is also specified. They control the color, size, and transparency specifications for showing divergences in the plot. The default values are displayed in the Usage section above.

The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

Parallel coordinates plot of MCMC draws. There is one dimension per parameter along the horizontal axis and each set of connected line segments represents a single MCMC draw (i.e., a vector of length equal to the number of parameters).

The parallel coordinates plot is most useful if the optional HMC/NUTS diagnostic information is provided via the `np` argument. In that case divergences are highlighted in the plot. The appearance of the divergences can be customized using the `np_style` argument and the `parcoord_style_np` helper function. This version of the plot is the same as the parallel coordinates plot described in Gabry et al. (2019).

When the plotted model parameters are on very different scales the `transformations` argument can be useful. For example, to standardize all variables before plotting you could use `function(x - mean(x))/sd(x)` when specifying the `transformations` argument to `mcmc_parcoord`. See the Examples section for how to do this.

np = np,
np_style = div_style
)

# mcmc_parcoord_data returns just the data in a conventient form for plotting
MCMC-recover

Compare MCMC estimates to "true" parameter values

Description

Plots comparing MCMC estimates to "true" parameter values. Before fitting a model to real data it is useful to simulate data according to the model using known (fixed) parameter values and to check that these "true" parameter values are (approximately) recovered by fitting the model to the simulated data. See the Plot Descriptions section, below, for details on the available plots.

Usage

mcmc_recover_intervals(
  x,
  true,
  batch = rep(1, length(true)),
  ...,
  facet_args = list(),
  prob = 0.5,
  prob_outer = 0.9,
  point_est = c("median", "mean", "none"),
  size = 4,
  alpha = 1
)

mcmc_recover_scatter(
  x,
  true,
  batch = rep(1, length(true)),
  ...,
  facet_args = list(),
  point_est = c("median", "mean"),
  size = 3,
  alpha = 1
)

mcmc_recover_hist(
  x,
  true,
  ...,
facet_args = list(),
binwidth = NULL,
bins = NULL,
breaks = NULL
)

Arguments

x An object containing MCMC draws:
- A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview
  page provides details on how to specify these.
- A draws object from the posterior package (e.g., draws_array, draws_rvars, etc.).
- An object with an as.array() method that returns the same kind of 3-D
  array described on the MCMC-overview page.

true A numeric vector of "true" values of the parameters in x. There should be one
value in true for each parameter included in x and the order of the parameters
in true should be the same as the order of the parameters in x.

batch Optionally, a vector-like object (numeric, character, integer, factor) used to split
the parameters into batches. If batch is specified, it must have the same length
as true and be in the same order as true. Parameters in the same batch will be
grouped together in the same facet in the plot (see the Examples section, below).
The default is to group all parameters together into a single batch. Changing the
default is most useful when parameters are on very different scales, in which
case batch can be used to group them into batches within which it makes sense
to use the same y-axis.

... Currently unused.

facet_args A named list of arguments (other than facets) passed to ggplot2::facet_wrap
or ggplot2::facet_grid() to control faceting. Note: if scales is not included
in facet_args then bayesplot may use scales="free" as the default (depend-
ning on the plot) instead of the ggplot2 default of scales="fixed".

prob The probability mass to include in the inner interval. The default is 0.5 (50%
interval).

prob_outer The probability mass to include in the outer interval. The default is 0.9 (90%
interval).

point_est The point estimate to show. Either "median" (the default), "mean", or "none".

size, alpha Passed to ggplot2::geom_point() to control the appearance of plotted points.

binwidth Passed to ggplot2::geom_histogram() to override the default binwidth.

bins Passed to ggplot2::geom_histogram() to override the default binwidth.

breaks Passed to ggplot2::geom_histogram() as an alternative to binwidth.

Value

A ggplot object that can be further customized using the ggplot2 package.
Plot Descriptions

`mcmc_recover_intervals()` Central intervals and point estimates computed from MCMC draws, with "true" values plotted using a different shape.

`mcmc_recover_scatter()` Scatterplot of posterior means (or medians) against "true" values.

`mcmc_recover_hist()` Histograms of the draws for each parameter with the "true" value overlaid as a vertical line.

Other MCMC: `MCMC-combos`, `MCMC-diagnostics`, `MCMC-distributions`, `MCMC-intervals`, `MCMC-nuts`, `MCMC-overview`, `MCMC-parcoord`, `MCMC-scatterplots`, `MCMC-traces`

Examples

```r
## Not run:
library(rstanarm)
alpha <- 1; beta <- rnorm(10, 0, 3); sigma <- 2
X <- matrix(rnorm(1000), 100, 10)
y <- rnorm(100, mean = c(alpha + X %*% beta), sd = sigma)
fit <- stan_glm(y ~ ., data = data.frame(y, X), refresh = 0)
draws <- as.matrix(fit)
true <- c(alpha, beta, sigma)

mcmc_recover_intervals(draws, true)

# put the coefficients on X into the same batch
mcmc_recover_intervals(draws, true, batch = c(1, rep(2, 10), 1))
# equivalent
mcmc_recover_intervals(draws, true, batch = grepl("X", colnames(draws)))
# same but facets stacked vertically
mcmc_recover_intervals(draws, true,
    batch = grepl("X", colnames(draws)),
    facet_args = list(ncol = 1),
    size = 3)

# each parameter in its own facet
mcmc_recover_intervals(draws, true, batch = 1:ncol(draws))
# same but in a different order
mcmc_recover_intervals(draws, true, batch = c(1, 3, 4, 2, 5:12))
# present as bias by centering with true values
mcmc_recover_intervals(sweep(draws, 2, true), rep(0, ncol(draws))) + hline_0()

# scatterplot of posterior means vs true values
mcmc_recover_scatter(draws, true, point_est = "mean")

# histograms of parameter draws with true value added as vertical line
color_scheme_set("brightblue")
mcmc_recover_hist(draws[, 1:4], true[1:4])
```
### MCMC-scatterplots

Scatterplots of MCMC draws. See the Plot Descriptions section, below, for details.

#### Usage

```r
mcmc_scatter(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  size = 2.5,
  alpha = 0.8,
  np = NULL,
  np_style = scatter_style_np()
)
```

```r
mcmc_hex(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  bins = 30,
  binwidth = NULL
)
```

```r
mcmc_pairs(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  diag_fun = c("hist", "dens"),
  off_diag_fun = c("scatter", "hex"),
  diag_args = list(),
  off_diag_args = list(),
  condition = pairs_condition(),
)
lp = NULL,
np = NULL,
np_style = pairs_style_np(),
max_treedepth = NULL,
grid_args = list(),
save_gg_objects = TRUE
)

scatter_style_np(
  div_color = "red",
  div_shape = 16,
  div_size = 2.5,
  div_alpha = 1
)

pairs_style_np(
  div_color = "red",
  div_shape = 4,
  div_size = 1,
  div_alpha = 1,
  td_color = "yellow2",
  td_shape = 3,
  td_size = 1,
  td_alpha = 1
)

pairs_condition(chains = NULL, draws = NULL, nuts = NULL)

Arguments

x
An object containing MCMC draws:

- A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.
- A draws object from the posterior package (e.g., draws_array, draws_rvars, etc.).
- An object with an as.array() method that returns the same kind of 3-D array described on the MCMC-overview page.

pars
An optional character vector of parameter names. If neither pars nor regex_pars is specified then the default is to use all parameters. As of version 1.7.0, bayesplot also supports 'tidy' parameter selection by specifying pars = vars(...), where ... is specified the same way as in dplyr::select(...) and similar functions. Examples of using pars in this way can be found on the Tidy parameter selection page.

regex_pars
An optional regular expression to use for parameter selection. Can be specified instead of pars or in addition to pars. When using pars for tidy parameter selection, the regex_pars argument is ignored since select helpers perform a similar function.
transformation

Optionally, transformations to apply to parameters before plotting. If transformations is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the transformations argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If transformations is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via match.fun(), e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or function(x) log(x)) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., transform).

size, alpha

For mcmc_scatter(), passed to ggplot2::geom_point() to control the appearance of the points.

np

Optionally, a data frame of NUTS sampler parameters, either created by nuts_params() or in the same form as the object returned by nuts_params(). The colors, shapes, and sizes of the superimposed points can be customized using the np_style argument.

np_style

If np is specified, np_style can be a call to the scatter_style_np() helper function (for mcmc_scatter()) or the pairs_style_np() helper function (for mcmc_pairs()) to specify arguments controlling the appearance of superimposed points representing NUTS diagnostic information. (Note: for pairs_style_np() the size arguments are interpreted as scaling factors).

bins, binwidth

For mcmc_hex(), an optional numeric vector of length two passed to ggplot2::geom_hex() to override the default binwidth in both the vertical and horizontal directions.

diag_fun, off_diag_fun

For mcmc_pairs(), the plotting function to use for the plots along the diagonal and for the off-diagonal plots, respectively. Currently diag_fun can be "hist" for histogram or "dens" for density, and off_diag_fun can be "scatter" for scatterplot or "hex" for a hexagonal heatmap.

diag_args, off_diag_args

For mcmc_pairs(), optional named lists of arguments to pass to the functions implied by the diag_fun and off_diag_fun arguments, respectively. For example, if off_diag_fun is "scatter" then off_diag_args could include optional arguments to mcmc_scatter() like size and alpha.

condition

For mcmc_pairs(), a call to the pairs_condition() helper function, which is used to specify a criterion for determining which chains (or iterations) are shown in the plots above the diagonal and which are shown in the plots below the diagonal. The histograms (or density plots) along the diagonal are always made using all chains and iterations, but the scatterplots (or hex plots) above and below the diagonal show different combinations of chains/iterations depending
on condition. The default is a call to \texttt{pairs_condition()} with none of its arguments specified. In this case half of the chains (or roughly half if there are an odd number) will be used in the plots above the diagonal and the rest in the plots below the diagonal. The \texttt{chains}, \texttt{draws}, and \texttt{nuts} arguments to \texttt{pairs_condition()}, which are documented below, can be used to change this default.

\textbf{lp} 

For \texttt{mcmc_pairs()}, a molten data frame of draws of the log-posterior or, more commonly, of a quantity equal to the log-posterior up to a constant. \texttt{lp} should either be created via \texttt{log_posterior()} or be an object with the same form as the object returned by \texttt{log_posterior()}.

\textbf{max_treedepth} 

For \texttt{mcmc_pairs()}, an integer representing the maximum treedepth allowed when fitting the model (if fit using NUTS). This is only needed for detecting which transitions (if any) hit the maximum treedepth.

\textbf{grid_args, save_gg_objects} 

For \texttt{mcmc_pairs()}, arguments to pass to \texttt{bayesplot_grid()}. For example, since \texttt{mcmc_pairs()} returns more than a single ggplot object, using \texttt{ggtitle()} afterwards will not work. But you can still add a title to the plot using \texttt{grid_args = list(top="My title")}.

\textbf{div_color, div_shape, div_size, div_alpha, td_color, td_shape, td_size, td_alpha} 

Optional arguments to the \texttt{scatter_style_np()} or \texttt{pairs_style_np()} helper functions that are eventually passed to \texttt{ggplot2::geom_point()}. The default values are displayed in the \texttt{Usage} section above.

\textbf{chains, draws, nuts} 

Optional arguments to the \texttt{pairs_condition()} helper function, which is used to specify the condition argument for \texttt{mcmc_pairs()}.

- The \texttt{chains} argument can be used to select some subset of the chains. If \texttt{chains} is an integer vector then the behavior is the same as the default (half the chains above the diagonal and half below) except using only the specified subset of chains. Alternatively, \texttt{chains} can be a list of two integer vectors with the first specifying the chains to be shown in the plots above the diagonal and the second for below the diagonal.

- The \texttt{draws} argument to \texttt{pairs_condition()} can be used to directly specify which realizations are plotted above and below the diagonal. \texttt{draws} can be a single proportion, which is interpreted as the proportion of realizations (among all chains) to plot in the lower panel starting with the first realization in each chain, with the complement (from the end of each chain) plotted in the upper panel. Alternatively \texttt{draws} can be a logical vector with length equal to the product of the number of iterations and the number of chains, in which case realizations corresponding to \texttt{FALSE} and \texttt{TRUE} will be plotted in the lower and upper panels, respectively.

- For models fit using NUTS, the \texttt{nuts} argument to \texttt{pairs_condition()} can be used. It takes a (possibly abbreviated) string to select among "\texttt{accept_stat__}", "\texttt{stepsize__}", "\texttt{treedepth__}", "\texttt{n_leapfrog__}", "\texttt{divergent__}", "\texttt{energy__}", and "\texttt{lp__}". These are the sampler parameters associated with \texttt{NUTS()} (and "\texttt{lp__}" is the log-posterior up to an additive constant). In this case, plots below the diagonal will contain realizations that are below the median of the indicated variable (or are zero in the case of "\texttt{divergent__}"),
and plots above the diagonal will contain realizations that are greater than or equal to the median of the indicated variable (or are one in the case of "divergent__"). If "lp__" is used then the lp argument to mcmc_pairs must also be specified. For the other NUTS parameters the np argument to mcmc_pairs() must also be specified.

Value

mcmc_scatter() and mcmc_hex() return a ggplot object that can be further customized using the ggplot2 package.

mcmc_pairs() returns many ggplot objects organized into a grid via bayesplot_grid().

Plot Descriptions

mcmc_scatter() Bivariate scatterplot of posterior draws. If using a very large number of posterior draws then mcmc_hex() may be preferable to avoid overplotting. For models fit using NUTS the np, and np_style arguments can be used to add additional information in the plot (in this case the approximate location of divergences). For more on why the scatter plot with divergences is a useful diagnostic tool see Gabry et al. (2019).

mcmc_hex() Hexagonal heatmap of 2-D bin counts. This plot is useful in cases where the posterior sample size is large enough that mcmc_scatter() suffers from overplotting.

mcmc_pairs() A square plot matrix with univariate marginal distributions along the diagonal (as histograms or kernel density plots) and bivariate distributions off the diagonal (as scatterplots or hex heatmaps).

For the off-diagonal plots, the default is to split the chains so that (roughly) half are displayed above the diagonal and half are below (all chains are always merged together for the plots along the diagonal). Other possibilities are available by setting the condition argument.

Additionally, extra diagnostic information for models fit using NUTS can be added to the pairs plot using the lp, np, and np_style arguments. If np is specified (and condition is not "divergent__"), then points (red, by default) will be superimposed onto the off-diagonal plots indicating which (if any) iterations encountered a divergent transition. Also, if both np and max_treedepth are specified then points (yellow, by default) will be superimposed to indicate a transition that hit the maximum treedepth rather than terminated its evolution normally. The np_style argument can be used with the pairs_style_np() convenience function to change the appearance of these overlaid points. See the Examples section.

    off_diag_args = list(size = 1, alpha = 1/3),
    condition = pairs_condition(nuts = "accept_stat__"),
    np = np
)

# more customizations:
# - transform sigma to log(sigma)
# - median log-posterior as 'condition'
# - hex instead of scatter for off-diagonal plots
# MCMC-traces

- show points where max treedepth hit in blue

```r
color_scheme_set("darkgray")
mcmc_pairs(
  posterior,
  pars = c("wt", "cyl", "sigma"),
  transform = list(sigma = "log"),
  off_diag_fun = "hex",
  condition = pairs_condition(nuts = "lp__"),
  lp = log_posterior(fit),
  np = np,
  np_style = pairs_style_np(div_color = "firebrick",
                            td_color = "blue",
                            td_size = 2),
  # for demonstration purposes, set max_treedepth to a value that will
  # result in at least a few max treedepth warnings
  max_treedepth = with(np, -1 + max(Value[Parameter == "treedepth__"])))
)
```

## End(Not run)

---

### Description

Trace and rank plots of MCMC draws. See the **Plot Descriptions** section, below, for details.

### Usage

```r
mcmc_trace(
  x,
  pars = character(),
  regex_pars = character(),
  transformations = list(),
  ...,
  facet_args = list(),
  n_warmup = 0,
  iter1 = 0,
  window = NULL,
  size = NULL,
  np = NULL,
  np_style = trace_style_np(),
  divergences = NULL
)

mcmc_trace_highlight(
  x,
  pars = character(),
```
regex_pars = character(),
transformations = list(),
...
facet_args = list(),
n_warmup = 0,
window = NULL,
size = NULL,
alpha = 0.2,
highlight = 1
)

trace_style_np(div_color = "red", div_size = 0.25, div_alpha = 1)

mcmc_rank_overlay(
  x,
pars = character(),
regex_pars = character(),
transformations = list(),
facet_args = list(),
...
  n_bins = 20,
  ref_line = FALSE
)

mcmc_rank_hist(
  x,
pars = character(),
regex_pars = character(),
transformations = list(),
...
  facet_args = list(),
n_bins = 20,
  ref_line = FALSE
)

mcmc_rank_ecdf(
  x,
pars = character(),
regex_pars = character(),
transformations = list(),
...
  K = NULL,
  facet_args = list(),
  prob = 0.99,
  plot_diff = FALSE,
  interpolate_adj = NULL
)
mcmc_trace_data(
    x,
    pars = character(),
    regex_pars = character(),
    transformations = list(),
...
    highlight = NULL,
    n_warmup = 0,
    iter1 = 0
)

**Arguments**

- **x**  
  An object containing MCMC draws:
  - A 3-D array, matrix, list of matrices, or data frame. The MCMC-overview page provides details on how to specify each these.
  - A draws object from the **posterior** package (e.g., `draws_array`, `draws_rvars`, etc.).
  - An object with an `as.array()` method that returns the same kind of 3-D array described on the MCMC-overview page.

- **pars**  
  An optional character vector of parameter names. If neither `pars` nor `regex_pars` is specified then the default is to use all parameters. As of version 1.7.0, bayesplot also supports 'tidy' parameter selection by specifying `pars = vars(...)` where `...` is specified the same way as in `dplyr::select(...)` and similar functions. Examples of using `pars` in this way can be found on the Tidy parameter selection page.

- **regex_pars**  
  An optional regular expression to use for parameter selection. Can be specified instead of `pars` or in addition to `pars`. When using `pars` for tidy parameter selection, the `regex_pars` argument is ignored since `select` helpers perform a similar function.

- **transformations**  
  Optionally, transformations to apply to parameters before plotting. If `transformations` is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the `transformations` argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If `transformations` is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via `match.fun()`, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. `log` or `function(x) log(x)`) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching `transformations` can be abbreviated for convenience in interactive use (e.g., `transform`).
... Currently ignored.

**facet_args**
A named list of arguments (other than facets) passed to `ggplot2::facet_wrap()` or `ggplot2::facet_grid()` to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the `ggplot2` default of scales="fixed".

**n_warmup**
An integer; the number of warmup iterations included in x. The default is n_warmup = 0, i.e. to assume no warmup iterations are included. If n_warmup > 0 then the background for iterations 1:n_warmup is shaded gray.

**iter1**
An integer; the iteration number of the first included draw (default is 0). This can be used to make it more obvious that the warmup iterations have been discarded from the traceplot. It cannot be specified if n_warmup is also set to a positive value.

**window**
An integer vector of length two specifying the limits of a range of iterations to display.

**size**
An optional value to override the default line size for mcmc_trace() or the default point size for mcmc_trace_highlight().

**np**
For models fit using NUTS (more generally, any symplectic integrator), an optional data frame providing NUTS diagnostic information. The data frame should be the object returned by `nuts_params()` or one with the same structure. If np is specified then tick marks are added to the bottom of the trace plot indicating within which iterations there was a divergence (if there were any). See the end of the Examples section, below.

**np_style**
A call to the `trace_style_np()` helper function to specify arguments controlling the appearance of tick marks representing divergences (if the np argument is specified).

**divergences**
Deprecated. Use the np argument instead.

**alpha**
For mcmc_trace_highlight(), passed to `ggplot2::geom_point()` to control the transparency of the points for the chains not highlighted.

**highlight**
For mcmc_trace_highlight(), an integer specifying one of the chains that will be more visible than the others in the plot.

**div_color, div_size, div_alpha**
Optional arguments to the `trace_style_np()` helper function that are eventually passed to `ggplot2::geom_rug()` if the np argument is also specified. They control the color, size, and transparency specifications for showing divergences in the plot. The default values are displayed in the Usage section above.

**n_bins**
For the rank plots, the number of bins to use for the histogram of rank-normalized MCMC samples. Defaults to 20.

**ref_line**
For the rank plots, whether to draw a horizontal line at the average number of ranks per bin. Defaults to FALSE.

**K**
An optional integer defining the number of equally spaced evaluation points for the PIT-ECDF. Reducing K when using `interpolate_adj = FALSE` makes computing the confidence bands faster. For `ppc_pit_ecdf` and `ppc_pit_ecdf_grouped`, if PIT values are supplied, defaults to `length(pit)`, otherwise `yrep` determines the maximum accuracy of the estimated PIT values and K is set to `min(nrow(yrep) + 1, 1000)`. For `mcmc_rank_ecdf`, defaults to the number of iterations per chain in x.
MCMC-traces

prob
For mcmc_rank_ecdf(), a value between 0 and 1 specifying the desired simultaneous confidence of the confidence bands to be drawn for the rank ECDF plots.

plot_diff
For mcmc_rank_ecdf(), a boolean specifying if the difference between the observed rank ECDFs and the theoretical expectation should be drawn instead of the unmodified rank ECDF plots.

interpolate_adj
A boolean defining if the simultaneous confidence bands should be interpolated based on precomputed values rather than computed exactly. Computing the bands may be computationally intensive and the approximation gives a fast method for assessing the ECDF trajectory. The default is to use interpolation if \( K \) is greater than 200.

Value
The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.
mcmc_trace_data() returns the data for the trace and rank plots in the same data frame.

Plot Descriptions

mcmc_trace() Standard trace plots of MCMC draws. For models fit using NUTS, the np argument can be used to also show divergences on the trace plot.
mcmc_trace_highlight() Traces are plotted using points rather than lines and the opacity of all chains but one (specified by the highlight argument) is reduced.
mcmc_rank_hist() Whereas traditional trace plots visualize how the chains mix over the course of sampling, rank histograms visualize how the values from the chains mix together in terms of ranking. An ideal plot would show the rankings mixing or overlapping in a uniform distribution. See Vehtari et al. (2019) for details.
mcmc_rank_overlay() Ranks from mcmc_rank_hist() are plotted using overlaid lines in a single panel.
mcmc_rank_ecdf() The ECDFs of the ranks from mcmc_rank_hist() are plotted with the simultaneous confidence bands with a coverage determined by prob, that is, bands that completely cover all of the rank ECDFs with the probability prob. If plot_diff = TRUE, the difference between the observed rank ECDFs and the theoretical expectation for samples originating from the same distribution is drawn. See Säilynoja et al. (2021) for details.

**PPC-censoring**

**PPC censoring**

### Description

Compare the empirical distribution of censored data \( y \) to the distributions of simulated/replicated data \( y_{rep} \) from the posterior predictive distribution. See the *Plot Descriptions* section, below, for details.

Although some of the other *bayesplot* plots can be used with censored data, `ppc_km_overlay()` is currently the only plotting function designed specifically for censored data. We encourage you to suggest or contribute additional plots at [github.com/stan-dev/bayesplot](https://github.com/stan-dev/bayesplot).
Usage

ppc_km_overlay(y, yrep, ..., status_y, size = 0.25, alpha = 0.7)

ppc_km_overlay_grouped(y, yrep, group, ..., status_y, size = 0.25, alpha = 0.7)

Arguments

y   A vector of observations. See Details.
yrep An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N is the number of predicted observations (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.
...
status_y The status indicator for the observations from y. This must be a numeric vector of the same length as y with values in \{0, 1\} (0 = right censored, 1 = event).
size, alpha Passed to the appropriate geom to control the appearance of the yrep distributions.
group A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

Value

A ggplot object that can be further customized using the ggplot2 package.

Plot Descriptions

ppc_km_overlay() Empirical CCDF estimates of each dataset (row) in yrep are overlaid, with the Kaplan-Meier estimate (Kaplan and Meier, 1958) for y itself on top (and in a darker shade). This is a PPC suitable for right-censored y. Note that the replicated data from yrep is assumed to be uncensored.

ppc_km_overlay_grouped() The same as ppc_km_overlay(), but with separate facets by group.

References

See Also

Other PPCs: ppc-discrete, ppc-distributions, ppc-errors, ppc-intervals, ppc-loo, ppc-overview, ppc-scatterplots, ppc-test-statistics
Examples

color_scheme_set("brightblue")
y <- example_y_data()
# For illustrative purposes, (right-)censor values y > 110:
status_y <- as.numeric(y <= 110)
y <- pmin(y, 110)
# In reality, the replicated data (yrep) would be obtained from a
# model which takes the censoring of y properly into account. Here,
# for illustrative purposes, we simply use example_yrep_draws():
yrep <- example_yrep_draws()
dim(yrep)

ppc_km_overlay(y, yrep[1:25, ], status_y = status_y)

# With separate facets by group:
group <- example_group_data()

ppc_km_overlay_grouped(y, yrep[1:25, ], group = group, status_y = status_y)

Description

Many of the PPC functions in bayesplot can be used with discrete data. The small subset of these functions that can only be used if y and yrep are discrete are documented on this page. Currently these include rootograms for count outcomes and bar plots for ordinal, categorical, and multinomial outcomes. See the Plot Descriptions section below.

Usage

ppc_bars(
  y,
  yrep,
  ...
)

ppc_bars_grouped(
  y,
  yrep,
  group,
...,
    facet_args = list(),
    prob = 0.9,
    width = 0.9,
    size = 1,
    fatten = 2.5,
    linewidth = 1,
    freq = TRUE
)

ppc_rootogram(
    y,
    yrep,
    style = c("standing", "hanging", "suspended"),
    ...
    prob = 0.9,
    size = 1
)

ppc_bars_data(y, yrep, group = NULL, prob = 0.9, freq = TRUE)

Arguments

y A vector of observations. See Details.
yrep An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N is the number of predicted observations (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.
...
prob A value between 0 and 1 indicating the desired probability mass to include in the yrep intervals. Set prob=0 to remove the intervals. (Note: for rootograms these are intervals of the square roots of the expected counts.)
width For bar plots only, passed to ggplot2::geom_bar() to control the bar width.
size, fatten, linewidth For bar plots, size, fatten, and linewidth are passed to ggplot2::geom_pointrange() to control the appearance of the yrep points and intervals. For rootograms size is passed to ggplot2::geom_line().
freq For bar plots only, if TRUE (the default) the y-axis will display counts. Setting freq=FALSE will put proportions on the y-axis.
group A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.
facet_args An optional list of arguments (other than facets) passed to ggplot2::facet_wrap() to control faceting.
style  For ppc_rootogram, a string specifying the rootogram style. The options are "standing", "hanging", and "suspended". See the Plot Descriptions section, below, for details on the different styles.

Details

For all of these plots y and yrep must be integers, although they need not be integers in the strict sense of R’s integer type. For rootogram plots y and yrep must also be non-negative.

Value

The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.

Plot Descriptions

ppc_bars()  Bar plot of y with yrep medians and uncertainty intervals superimposed on the bars.
ppc_bars_grouped()  Same as ppc_bars() but a separate plot (facet) is generated for each level of a grouping variable.
ppc_rootogram()  Rootograms allow for diagnosing problems in count data models such as overdispersion or excess zeros. They consist of a histogram of y with the expected counts based on yrep overlaid as a line along with uncertainty intervals. The y-axis represents the square roots of the counts to approximately adjust for scale differences and thus ease comparison between observed and expected counts. Using the style argument, the histogram style can be adjusted to focus on different aspects of the data:

• **Standing**: basic histogram of observed counts with curve showing expected counts.
• **Hanging**: observed counts counts hanging from the curve representing expected counts.
• **Suspended**: histogram of the differences between expected and observed counts.

All of the rootograms are plotted on the square root scale. See Kleiber and Zeileis (2016) for advice on interpreting rootograms and selecting among the different styles.

Examples

```r
set.seed(9222017)

# bar plots
f <- function(N) {
    sample(1:4, size = N, replace = TRUE, prob = c(0.25, 0.4, 0.1, 0.25))
```
```r
y <- f(100)
yrep <- t(replicate(500, f(100)))
dim(yrep)
group <- gl(2, 50, length = 100, labels = c("GroupA", "GroupB"))

color_scheme_set("mix-pink-blue")
ppc_bars(y, yrep)

# split by group, change interval width, and display proportion
# instead of count on y-axis
color_scheme_set("mix-blue-pink")
ppc_bars_grouped(y, yrep, group, prob = 0.5, freq = FALSE)

## Not run:
# example for ordinal regression using rstanarm
library(rstanarm)
fit <- stan_polr(
  tobgp ~ agegp,
  data = esoph,
  method = "probit",
  prior = R2(0.2, "mean"),
  init_r = 0.1,
  seed = 12345,
  # cores = 4,
  refresh = 0
)

# coded as character, so convert to integer
yrep_char <- posterior_predict(fit)
print(yrep_char[1, 1:4])

yrep_int <- sapply(data.frame(yrep_char, stringsAsFactors = TRUE), as.integer)
y_int <- as.integer(esoph$tobgp)

ppc_bars(y_int, yrep_int)

ppc_bars_grouped(
  y = y_int,
  yrep = yrep_int,
  group = esoph$agegp,
  freq=FALSE,
  prob = 0.5,
  fatten = 1,
  size = 1.5
)

## End(Not run)

# rootograms for counts
y <- rpois(100, 20)
yrep <- matrix(rpois(10000, 20), ncol = 100)
```

color_scheme_set("brightblue")
ppc_rootogram(y, yrep)
ppc_rootogram(y, yrep, prob = 0)

ppc_rootogram(y, yrep, style = "hanging", prob = 0.8)
ppc_rootogram(y, yrep, style = "suspended")

PPC-distributions  PPC distributions

Description

Compare the empirical distribution of the data y to the distributions of simulated/replicated data yrep from the posterior predictive distribution. See the Plot Descriptions section, below, for details.

Usage

ppc_data(y, yrep, group = NULL)

ppc_dens_overlay(
  y,
  yrep,
  ...,  
  size = 0.25,
  alpha = 0.7,
  trim = FALSE,
  bw = "nrd0",
  adjust = 1,
  kernel = "gaussian",
  n_dens = 1024
)

ppc_dens_overlay_grouped(
  y,
  yrep,

  \text{prob} = 0.99, \\
  \text{plot_diff} = \text{FALSE}, \\
  \text{interpolate_adj} = \text{NULL}
\)
Arguments

\texttt{y} \hspace{1cm} A vector of observations. See Details.

\texttt{yrep} \hspace{1cm} An \(S \times N\) matrix of draws from the posterior (or prior) predictive distribution. The number of rows, \(S\), is the size of the posterior (or prior) sample used to generate \(y\). The number of columns, \(N\), is the number of predicted observations (\texttt{length(y)}). The columns of \(y\) should be in the same order as the data points in \(y\) for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

\texttt{group} \hspace{1cm} A grouping variable of the same length as \(y\). Will be coerced to \texttt{factor} if not already a factor. Each value in \(group\) is interpreted as the group level pertaining to the corresponding observation.

\texttt{...} \hspace{1cm} Currently unused.

\texttt{size}, \texttt{alpha} \hspace{1cm} Passed to the appropriate geom to control the appearance of the predictive distributions.

\texttt{trim} \hspace{1cm} A logical scalar passed to \texttt{ggplot2::geom_density()}. 

\texttt{bw}, \texttt{adjust}, \texttt{kernel}, \texttt{n_dens} \hspace{1cm} Optional arguments passed to \texttt{stats::density()} to override default kernel density estimation parameters. \(n\_dens\) defaults to 1024.

\texttt{discrete} \hspace{1cm} For \texttt{ppc_ecdf_overlay()}, should the data be treated as discrete? The default is FALSE, in which case \texttt{geom=“line”} is passed to \texttt{ggplot2::stat_ecdf()}. If \texttt{discrete} is set to TRUE then \texttt{geom=“step”} is used.

\texttt{pad} \hspace{1cm} A logical scalar passed to \texttt{ggplot2::stat_ecdf()}. 

\texttt{binwidth} \hspace{1cm} Passed to \texttt{ggplot2::geom_histogram()} to override the default binwidth.

\texttt{bins} \hspace{1cm} Passed to \texttt{ggplot2::geom_histogram()} to override the default binwidth.

\texttt{breaks} \hspace{1cm} Passed to \texttt{ggplot2::geom_histogram()} as an alternative to \texttt{binwidth}.

\texttt{freq} \hspace{1cm} For histograms, \texttt{freq=TRUE} (the default) puts count on the y-axis. Setting \texttt{freq=FALSE} puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the \texttt{yaxis_text()} convenience function.)

\texttt{notch} \hspace{1cm} For the box plot, a logical scalar passed to \texttt{ggplot2::geom_boxplot()}. Note: unlike \texttt{geom_boxplot()}, the default is \texttt{notch=TRUE}.

\texttt{probs} \hspace{1cm} A numeric vector passed to \texttt{ggplot2::geom_violin()}’s \texttt{draw_quantiles} argument to specify at which quantiles to draw horizontal lines. Set to NULL to remove the lines.

\texttt{y_draw} \hspace{1cm} For \texttt{ppc_violin_grouped()}, a string specifying how to draw \(y\): “violin” (default), “points” (jittered points), or “both”.

\texttt{y_jitter}, \texttt{y_size}, \texttt{y_alpha} \hspace{1cm} For \texttt{ppc_violin_grouped()}, if \(y\) is “points” or “both” then \texttt{y_size}, \texttt{y_alpha}, and \texttt{y_jitter} are passed to the size, alpha, and width arguments of \texttt{ggplot2::geom_jitter()} to control the appearance of \(y\) points. The default of \texttt{y_jitter=NULL} will let \texttt{ggplot2} determine the amount of jitter.

\texttt{pit} \hspace{1cm} An optional vector of probability integral transformed values for which the ECDF is to be drawn. If NULL, PIT values are computed to \(y\) with respect to the corresponding values in \(yrep\).
K
An optional integer defining the number of equally spaced evaluation points for the PIT-ECDF. Reducing K when using interpolate_adj = FALSE makes computing the confidence bands faster. For ppc_pit_ecdf and ppc_pit_ecdf_grouped, if PIT values are supplied, defaults to length(pit), otherwise yrep determines the maximum accuracy of the estimated PIT values and K is set to \( \min(\text{NR}(\text{yrep}) + 1, 1000) \). For mcmc_rank_ecdf, defaults to the number of iterations per chain in x.

prob
The desired simultaneous coverage level of the bands around the ECDF. A value in (0,1).

plot_diff
A boolean defining whether to plot the difference between the observed PIT-ECDF and the theoretical expectation for uniform PIT values rather than plotting the regular ECDF. The default is FALSE, but for large samples we recommend setting plot_diff=TRUE as the difference plot will visually show a more dynamic range.

interpolate_adj
A boolean defining if the simultaneous confidence bands should be interpolated based on precomputed values rather than computed exactly. Computing the bands may be computationally intensive and the approximation gives a fast method for assessing the ECDF trajectory. The default is to use interpolation if K is greater than 200.

Details
For Binomial data, the plots may be more useful if the input contains the "success" proportions (not discrete "success" or "failure" counts).

Value
The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.

Plot Descriptions

ppc_hist(), ppc_freqpoly(), ppc_dens(), ppc_boxplot() A separate histogram, shaded frequency polygon, smoothed kernel density estimate, or box and whiskers plot is displayed for y and each dataset (row) in yrep. For these plots yrep should therefore contain only a small number of rows. See the Examples section.

ppc_freqpoly_grouped() A separate frequency polygon is plotted for each level of a grouping variable for y and each dataset (row) in yrep. For this plot yrep should therefore contain only a small number of rows. See the Examples section.

ppc_ecdf_overlay(), ppc_dens_overlay(), ppc_ecdf_overlay_grouped(), ppc_dens_overlay_grouped() Kernel density or empirical CDF estimates of each dataset (row) in yrep are overlaid, with the distribution of y itself on top (and in a darker shade). When using ppc_ecdf_overlay() with discrete data, set the discrete argument to TRUE for better results. For an example of ppc_dens_overlay() also see Gabry et al. (2019).
ppc_violin_grouped() The density estimate of yrep within each level of a grouping variable is plotted as a violin with horizontal lines at notable quantiles. y is overlaid on the plot either as a violin, points, or both, depending on the y_draw argument.

ppc_pit_ecdf(), ppc_pit_ecdf_grouped() The PIT-ECDF of the empirical PIT values of y computed with respect to the corresponding yrep values. 100 * prob% central simultaneous confidence intervals are provided to assess if y and yrep originate from the same distribution. The PIT values can also be provided directly as pit. See Säilynoja et al. (2021) for more details.

---

**PPC-errors**  
**PPC errors**

**Description**

Various plots of predictive errors $y - y_{rep}$. See the Details and Plot Descriptions sections, below.
Usage

```r
ppc_error_hist(
  y,
  yrep,
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE
)
```

```r
ppc_error_hist_grouped(
  y,
  yrep,
  group,
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE
)
```

```r
ppc_error_scatter(y, yrep, ..., facet_args = list(), size = 2.5, alpha = 0.8)
```

```r
ppc_error_scatter_avg(y, yrep, ..., size = 2.5, alpha = 0.8)
```

```r
ppc_error_scatter_avg_grouped(
  y,
  yrep,
  group,
  ..., 
  facet_args = list(),
  size = 2.5,
  alpha = 0.8
)
```

```r
ppc_error_scatter_avg_vs_x(y, yrep, x, ..., size = 2.5, alpha = 0.8)
```

```r
ppc_error_binned(
  y,
  yrep,
  ..., 
  facet_args = list(),
  bins = NULL,
  size = 1,
  alpha = 0.25
)
ppc_error_data(y, yrep, group = NULL)

Arguments

y
A vector of observations. See Details.

yrep
An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N, is the number of predicted observations (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

... Currently unused.

facet_args
A named list of arguments (other than facets) passed to ggplot2:::facet_wrap() or ggplot2:::facet_grid() to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the ggplot2 default of scales="fixed".

binwidth
Passed to ggplot2:::geom_histogram() to override the default binwidth.

bins
For ppc_error_binned(), the number of bins to use (approximately).

breaks
Passed to ggplot2:::geom_histogram() as an alternative to binwidth.

freq
For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the yaxis_text() convenience function.)

group
A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

size, alpha
For scatterplots, arguments passed to ggplot2:::geom_point() to control the appearance of the points. For the binned error plot, arguments controlling the size of the outline and opacity of the shaded region indicating the 2-SE bounds.

x
A numeric vector the same length as y to use as the x-axis variable.

Details

All of these functions (aside from the *_scatter_avg functions) compute and plot predictive errors for each row of the matrix yrep, so it is usually a good idea for yrep to contain only a small number of draws (rows). See Examples, below.

For binomial and Bernoulli data the ppc_error_binned() function can be used to generate binned error plots. Bernoulli data can be input as a vector of 0s and 1s, whereas for binomial data y and yrep should contain "success" proportions (not counts). See the Examples section, below.

Value

A ggplot object that can be further customized using the ggplot2 package.
Plot descriptions

ppc_error_hist() A separate histogram is plotted for the predictive errors computed from y and each dataset (row) in yrep. For this plot yrep should have only a small number of rows.

ppc_error_hist_grouped() Like ppc_error_hist(), except errors are computed within levels of a grouping variable. The number of histograms is therefore equal to the product of the number of rows in yrep and the number of groups (unique values of group).

ppc_error_scatter() A separate scatterplot is displayed for y vs. the predictive errors computed from y and each dataset (row) in yrep. For this plot yrep should have only a small number of rows.

ppc_error_scatter_avg() A single scatterplot of y vs. the average of the errors computed from y and each dataset (row) in yrep. For each individual data point y[n] the average error is the average of the errors for y[n] computed over the the draws from the posterior predictive distribution.

ppc_error_scatter_avg_vs_x() Same as ppc_error_scatter_avg(), except the average is plotted on the y-axis and a predictor variable x is plotted on the x-axis.

ppc_error_binned() Intended for use with binomial data. A separate binned error plot (similar to arm::binnedplot()) is generated for each dataset (row) in yrep. For this plot y and yrep should contain proportions rather than counts, and yrep should have only a small number of rows.

  prob_outer = 0.9, 
  alpha = 0.33, 
  size = 0.25, 
  y_draw = c("line", "points", "both")
)
```
### Arguments

**y**
A vector of observations. See Details.

**yrep**
An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N, is the number of predicted observations (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

**x**
A numeric vector to use as the x-axis variable. For example, x could be a predictor variable from a regression model, a time variable for time-series models, etc. If x is missing or NULL then the observation index is used for the x-axis.

**...**
Currently unused.

**prob, prob_outer**
Values between 0 and 1 indicating the desired probability mass to include in the inner and outer intervals. The defaults are prob=0.5 and prob_outer=0.9.

**alpha, size, fatten, linewidth**
Arguments passed to geoms. For ribbon plots alpha is passed to `ggplot2::geom_ribbon()` to control the opacity of the outer ribbon and size is passed to `ggplot2::geom_line()` to control the size of the line representing the median prediction (size=0 will remove the line). For interval plots alpha, size, fatten, and linewidth are passed to `ggplot2::geom_pointrange()` (fatten=0 will remove the point estimates).

**group**
A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

**facet_args**
A named list of arguments (other than facets) passed to `ggplot2::facet_wrap()` or `ggplot2::facet_grid()` to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the ggplot2 default of scales="fixed".

**y_draw**
For ribbon plots only, a string specifying how to draw y. Can be "line" (the default), "points", or "both".
Value
The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

Plot Descriptions

`ppc_intervals()`, `ppc_ribbon()` 100*prob% central intervals for `yrep` at each `x` value. `ppc_intervals()` plots intervals as vertical bars with points indicating `yrep` medians and darker points indicating observed `y` values. `ppc_ribbon()` plots a ribbon of connected intervals with a line through the median of `yrep` and a darker line connecting observed `y` values. In both cases an optional `x` variable can also be specified for the x-axis variable.

Depending on the number of observations and the variability in the predictions at different values of `x`, one of these plots may be easier to read than the other.

`ppc_intervals_grouped()`, `ppc_ribbon_grouped()` Same as `ppc_intervals()` and `ppc_ribbon()`, respectively, but a separate plot (facet) is generated for each level of a grouping variable.

## End(Not run)
Description

Leave-One-Out (LOO) predictive checks. See the **Plot Descriptions** section, below, and Gabry et al. (2019) for details.

Usage

```r
ppc_loo_pit_overlay(
  y,
  yrep,
  lw = NULL,
  ..., 
  psis_object = NULL,
  pit = NULL,
  samples = 100,
  size = 0.25,
  alpha = 0.7,
  boundary_correction = TRUE,
  grid_len = 512,
  bw = "nrd0",
  trim = FALSE,
  adjust = 1,
  kernel = "gaussian",
  n_dens = 1024
)

ppc_loo_pit_data(
  y,
  yrep,
  lw = NULL,
  ..., 
  psis_object = NULL,
  pit = NULL,
  samples = 100,
  bw = "nrd0",
  boundary_correction = TRUE,
  grid_len = 512
)

ppc_loo_pit_qq(
  y,
  yrep,
  lw = NULL,
  ..., 
  psis_object = NULL,
  pit = NULL,
  compare = c("uniform", "normal"),
  size = 2,
  alpha = 1
)```
Arguments

**y**  
A vector of observations. See Details.

**yrep**  
An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N is the number of predicted observa-
tions (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

lw
A matrix of (smoothed) log weights with the same dimensions as yrep. See loo::psis() and the associated weights() method as well as the Examples section, below. If lw is not specified then psis_object can be provided and log weights will be extracted.

... Currently unused.

psis_object
If using loo version 2.0.0 or greater, an object returned by the psis() function (or by the loo() function with argument save_psis set to TRUE).

pit
For ppc_loo_pit_overlay() and ppc_loo_pit_qq(), optionally a vector of precomputed PIT values that can be specified instead of y, yrep, and lw (these are all ignored if pit is specified). If not specified the PIT values are computed internally before plotting.

samples
For ppc_loo_pit_overlay(), the number of data sets (each the same size as y) to simulate from the standard uniform distribution. The default is 100. The density estimate of each dataset is plotted as a thin line in the plot, with the density estimate of the LOO PITs overlaid as a thicker dark line.

alpha, size, fatten, linewidth
Arguments passed to code geoms to control plot aesthetics. For ppc_loo_pit_qq() and ppc_loo_pit_overlay(), size and alpha are passed to ggplot2::geom_point() and ggplot2::geom_density(), respectively. For ppc_loo_intervals(), size linewidth and fatten are passed to ggplot2::geom_pointrange(). For ppc_loo_ribbon(), alpha and size are passed to ggplot2::geom_ribbon().

boundary_correction
For ppc_loo_pit_overlay(), when set to TRUE (the default) the function will compute boundary corrected density values via convolution and a Gaussian filter, also known as the reflection method (Boneva et al., 1971). As a result, parameters controlling the standard kernel density estimation such as adjust, kernel and n_dens are ignored. NOTE: The current implementation only works well for continuous observations.

grid_len
For ppc_loo_pit_overlay(), when boundary_correction is set to TRUE this parameter specifies the number of points used to generate the estimations. This is set to 512 by default.

bw, adjust, kernel, n_dens
Optional arguments passed to stats::density() to override default kernel density estimation parameters. n_dens defaults to 1024.

trim
Passed to ggplot2::stat_density().

compare
For ppc_loo_pit_qq(), a string that can be either "uniform" or "normal". If "uniform" (the default) the Q-Q plot compares computed PIT values to the standard uniform distribution. If compare="normal", the Q-Q plot compares standard normal quantiles calculated from the PIT values to the theoretical standard normal quantiles.

subset
For ppc_loo_intervals() and ppc_loo_ribbon(), an optional integer vector indicating which observations in y (and yrep) to include. Dropping observations from y and yrep manually before passing them to the plotting function
will not work because the dimensions will not match up with the dimensions of psis_object, but if all of y and yrep are passed along with subset then bayesplot can do the subsetting internally for y, yrep and psis_object. See the Examples section for a demonstration.

**intervals**

For ppc_loo_intervals() and ppc_loo_ribbon(), optionally a matrix of pre-computed LOO predictive intervals that can be specified instead of yrep (ignored if intervals is specified). If not specified the intervals are computed internally before plotting. If specified, intervals must be a matrix with number of rows equal to the number of data points and five columns in the following order: lower outer interval, lower inner interval, median (50%), upper inner interval and upper outer interval (column names are ignored).

**prob, prob_outer**

Values between 0 and 1 indicating the desired probability mass to include in the inner and outer intervals. The defaults are prob=0.5 and prob_outer=0.9.

**order**

For ppc_loo_intervals(), a string indicating how to arrange the plotted intervals. The default ("index") is to plot them in the order of the observations. The alternative ("median") arranges them by median value from smallest (left) to largest (right).

**Value**

A ggplot object that can be further customized using the ggplot2 package.

**Plot Descriptions**

ppc_loo_pit_overlay(), ppc_loo_pit_qq() The calibration of marginal predictions can be assessed using probability integral transformation (PIT) checks. LOO improves the check by avoiding the double use of data. See the section on marginal predictive checks in Gelman et al. (2013, p. 152–153) and section 5 of Gabry et al. (2019) for an example of using bayesplot for these checks.

The LOO PIT values are asymptotically uniform (for continuous data) if the model is calibrated. The ppc_loo_pit_overlay() function creates a plot comparing the density of the LOO PITs (thick line) to the density estimates of many simulated data sets from the standard uniform distribution (thin lines). See Gabry et al. (2019) for an example of interpreting the shape of the miscalibration that can be observed in these plots.

The ppc_loo_pit_qq() function provides an alternative visualization of the miscalibration with a quantile-quantile (Q-Q) plot comparing the LOO PITs to the standard uniform distribution. Comparing to the uniform is not good for extreme probabilities close to 0 and 1, so it can sometimes be useful to set the compare argument to "normal", which will produce a Q-Q plot comparing standard normal quantiles calculated from the PIT values to the theoretical standard normal quantiles. This can help see the (mis)calibration better for the extreme values. However, in most cases we have found that the overlaid density plot (ppc_loo_pit_overlay()) function will provide a clearer picture of calibration problems than the Q-Q plot.

ppc_loo_intervals(), ppc_loo_ribbon() Similar to ppc_intervals() and ppc_ribbon() but the intervals are for the LOO predictive distribution.

## End(Not run)

### Description

The **bayesplot** PPC module provides various plotting functions for creating graphical displays comparing observed data to simulated data from the posterior (or prior) predictive distribution. See the sections below for a brief discussion of the ideas behind posterior predictive checking, an overview of the available PPC plots, and tips on providing an interface to **bayesplot** from another package.

For plots of posterior (or prior) predictive distributions that do *not* include observed data see **PPD-overview** instead.

### Details

The idea behind posterior predictive checking is simple: if a model is a good fit then we should be able to use it to generate data that looks a lot like the data we observed.

**Posterior predictive distribution:** To generate the data used for posterior predictive checks we simulate from the *posterior predictive distribution*. The posterior predictive distribution is the distribution of the outcome variable implied by a model after using the observed data $y$ (a vector of outcome values), and typically predictors $X$, to update our beliefs about the unknown parameters $\theta$ in the model. For each draw of the parameters $\theta$ from the posterior distribution $p(\theta | y, X)$ we generate an entire vector of outcomes. The result is an $S \times N$ matrix of simulations, where $S$ is the size of the posterior sample (number of draws from the posterior distribution) and $N$ is the number of data points in $y$. That is, each row of the matrix is an individual "replicated" dataset of $N$ observations.

**Notation:** When simulating from the posterior predictive distribution we can use either the same values of the predictors $X$ that we used when fitting the model or new observations of those predictors. When we use the same values of $X$ we denote the resulting simulations by $y^{rep}$ as they can be thought of as *replications* of the outcome $y$ rather than predictions for future observations. This corresponds to the notation from Gelman et. al. (2013) and is the notation used throughout the documentation for this package.

**Graphical posterior predictive checking:** Using the datasets $y^{rep}$ drawn from the posterior predictive distribution, the functions in the **bayesplot** package produce various graphical displays comparing the observed data $y$ to the replications. For a more thorough discussion of posterior predictive checking see Chapter 6 of Gelman et. al. (2013).
Prior predictive checking: To use bayesplot for prior predictive checks you can simply use draws from the prior predictive distribution instead of the posterior predictive distribution. See Gabry et al. (2019) for more on prior predictive checking and when it is reasonable to compare the prior predictive distribution to the observed data. If you want to avoid using the observed data for prior predictive checks then you can use the bayesplot PPD plots instead, which do not take a y argument, or you can use the PPC plots but provide plausible or implausible y values that you want to compare to the prior predictive realizations.

PPC plotting functions

The plotting functions for prior and posterior predictive checking all have the prefix ppc_ and all require the arguments y, a vector of observations, and yrep, a matrix of replications (in-sample predictions). The plots are organized into several categories, each with its own documentation:

- **PPC-distributions**: Histograms, kernel density estimates, boxplots, and other plots comparing the empirical distribution of data y to the distributions of individual simulated datasets (rows) in yrep.
- **PPC-test-statistics**: The distribution of a statistic, or a pair of statistics, over the simulated datasets (rows) in yrep compared to value of the statistic(s) computed from y.
- **PPC-intervals**: Interval estimates of yrep with y overlaid. The x-axis variable can be optionally specified by the user (e.g. to plot against a predictor variable or over time).
- **PPC-errors**: Plots of predictive errors (y - yrep) computed from y and each of the simulated datasets (rows) in yrep. For binomial models binned error plots are also available.
- **PPC-scatterplots**: Scatterplots (and similar visualizations) of the data y vs. individual simulated datasets (rows) in yrep, or vs. the average value of the distributions of each data point (columns) in yrep.
- **PPC-discrete**: PPC functions that can only be used if y and yrep are discrete. For example, rootograms for count outcomes and bar plots for ordinal, categorical, and multinomial outcomes.
- **PPC-loo**: PPC functions for predictive checks based on (approximate) leave-one-out (LOO) cross-validation.
- **PPC-censoring**: PPC functions comparing the empirical distribution of censored data y to the distributions of individual simulated datasets (rows) in yrep.

Providing an interface for predictive checking from another package

In addition to the various plotting functions, the bayesplot package provides the S3 generic pp_check(). Authors of R packages for Bayesian inference are encouraged to define pp_check() methods for the fitted model objects created by their packages. See the package vignettes for more details and a simple example, and see the rstanarm and brms packages for full examples of pp_check() methods.

References

**See Also**

Other PPCs: PPC-censoring, PPC-discrete, PPC-distributions, PPC-errors, PPC-intervals, PPC-loo, PPC-scatterplots, PPC-test-statistics

**Description**

Scatterplots of the observed data \( y \) vs. simulated/replicated data \( y_{\text{rep}} \) from the posterior predictive distribution. See the **Plot Descriptions** and **Details** sections, below.

**Usage**

```r
ppc_scatter(
  y, yrep, ...
  facet_args = list(),
  size = 2.5,
  alpha = 0.8,
  ref_line = TRUE
)

ppc_scatter_avg(y, yrep, ..., size = 2.5, alpha = 0.8, ref_line = TRUE)

ppc_scatter_avg_grouped(
  y, yrep,
  group,
  ...
  facet_args = list(),
  size = 2.5,
  alpha = 0.8,
  ref_line = TRUE
)

ppc_scatter_data(y, yrep)

ppc_scatter_avg_data(y, yrep, group = NULL)
```
Arguments

y
A vector of observations. See Details.
yrep
An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate yrep. The number of columns, N is the number of predicted observations (length(y)). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

... Currently unused.
facet_args
A named list of arguments (other than facets) passed to ggplot2::facet_wrap() or ggplot2::facet_grid() to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the ggplot2 default of scales="fixed".

size, alpha
Arguments passed to ggplot2::geom_point() to control the appearance of the points.
ref_line
If TRUE (the default) a dashed line with intercept 0 and slope 1 is drawn behind the scatter plot.
group
A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

Details

For Binomial data, the plots may be more useful if the input contains the "success" proportions (not discrete "success" or "failure" counts).

Value

The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.

Plot Descriptions

ppc_scatter() For each dataset (row) in yrep a scatterplot is generated showing y against that row of yrep. For this plot yrep should only contain a small number of rows.

ppc_scatter_avg() A single scatterplot of y against the average values of yrep, i.e., the points (x,y) = (mean(yrep[, n]), y[n]), where each yrep[, n] is a vector of length equal to the number of posterior draws. Unlike for ppc_scatter(), for ppc_scatter_avg() yrep should contain many draws (rows).

ppc_scatter_avg_grouped() The same as ppc_scatter_avg(), but a separate plot is generated for each level of a grouping variable.

References

Other PPCs: PPC-censoring, PPC-discrete, PPC-distributions, PPC-errors, PPC-intervals, PPC-loo, PPC-overview, PPC-test-statistics

Examples

```r
y <- example_y_data()
yrep <- example_yrep_draws()
p1 <- ppc_scatter_avg(y, yrep)
p1

# don't draw line x=y
ppc_scatter_avg(y, yrep, ref_line = FALSE)

p2 <- ppc_scatter(y, yrep[20:23, ], alpha = 0.5, size = 1.5)
p2

# give x and y axes the same limits
lims <- ggplot2::lims(x = c(0, 160), y = c(0, 160))
p1 + lims
p2 + lims

# for ppc_scatter_avg_grouped the default is to allow the facets
# to have different x and y axes
group <- example_group_data()
ppc_scatter_avg_grouped(y, yrep, group)

# let x-axis vary but force y-axis to be the same
ppc_scatter_avg_grouped(y, yrep, group, facet_args = list(scales = "free_x"))
```

---

**Description**

The distribution of a (test) statistic $T(y_{rep})$, or a pair of (test) statistics, over the simulated datasets in $y_{rep}$, compared to the observed value $T(y)$ computed from the data $y$. See the Plot Descriptions and Details sections, below, as well as Gabry et al. (2019).

**Usage**

```r
ppc_stat(
y,
yrep,
stat = "mean",
..., 
binwidth = NULL,
bins = NULL,
```
```r

breaks = NULL,
freq = TRUE
)

ppc_stat_grouped(
  y,
  yrep,
  group,
  stat = "mean",
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE
)

ppc_stat_freqpoly(
  y,
  yrep,
  stat = "mean",
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  freq = TRUE
)

ppc_stat_freqpoly_grouped(
  y,
  yrep,
  group,
  stat = "mean",
  ..., 
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  freq = TRUE
)

ppc_stat_2d(y, yrep, stat = c("mean", "sd"), ..., size = 2.5, alpha = 0.7)

ppc_stat_data(y, yrep, group = NULL, stat)
```

**Arguments**

- `y`  
  A vector of observations. See Details.

- `yrep`  
  An S by N matrix of draws from the posterior (or prior) predictive distribution.
The number of rows, \( S \), is the size of the posterior (or prior) sample used to generate \( y_{rep} \). The number of columns, \( N \) is the number of predicted observations \( \text{length}(y) \). The columns of \( y_{rep} \) should be in the same order as the data points in \( y \) for the plots to make sense. See the Details and Plot Descriptions sections for additional advice specific to particular plots.

**stat**

A single function or a string naming a function, except for the 2D plot which requires a vector of exactly two names or functions. In all cases the function(s) should take a vector input and return a scalar statistic. If specified as a string (or strings) then the legend will display the function name(s). If specified as a function (or functions) then generic naming is used in the legend.

... Currently unused.

**binwidth**

Passed to `ggplot2::geom_histogram()` to override the default binwidth.

**bins**

Passed to `ggplot2::geom_histogram()` to override the default binwidth.

**breaks**

Passed to `ggplot2::geom_histogram()` as an alternative to `binwidth`.

**freq**

For histograms, \( \text{freq} = \text{TRUE} \) (the default) puts count on the y-axis. Setting \( \text{freq} = \text{FALSE} \) puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the `yaxis_text()` convenience function.)

**group**

A grouping variable of the same length as \( y \). Will be coerced to `factor` if not already a factor. Each value in `group` is interpreted as the group level pertaining to the corresponding observation.

**facet_args**

A named list of arguments (other than `facets`) passed to `ggplot2::facet_wrap()` or `ggplot2::facet_grid()` to control faceting. Note: if `scales` is not included in `facet_args` then `bayesplot` may use `scales="free"` as the default (depending on the plot) instead of the `ggplot2` default of `scales="fixed"`.

**size, alpha**

For the 2D plot only, arguments passed to `ggplot2::geom_point()` to control the appearance of scatterplot points.

**Details**

For Binomial data, the plots may be more useful if the input contains the "success" proportions (not discrete "success" or "failure" counts).

**Value**

The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

**Plot Descriptions**

`ppc_stat()`, `ppc_stat_freqpoly()` A histogram or frequency polygon of the distribution of a statistic computed by applying `stat` to each dataset (row) in \( y_{rep} \). The value of the statistic in the observed data, `stat(y)`, is overlaid as a vertical line. More details and example usage of `ppc_stat()` can be found in Gabry et al. (2019).
ppc_stat_grouped(), ppc_stat_freqpoly_grouped() The same as ppc_stat() and ppc_stat_freqpoly(), but a separate plot is generated for each level of a grouping variable. More details and example usage of ppc_stat_grouped() can be found in Gabry et al. (2019).

ppc_stat_2d() A scatterplot showing the joint distribution of two statistics computed over the datasets (rows) in yrep. The value of the statistics in the observed data is overlaid as a large point.

Examples

y <- example_y_data()
yrep <- example_yrep_draws()
ppc_stat(y, yrep)
ppc_stat(y, yrep, stat = "sd") + legend_none()

# use your own function for the 'stat' argument
color_scheme_set("brightblue")
q25 <- function(y) quantile(y, 0.25)
ppc_stat(y, yrep, stat = "q25") # legend includes function name

# can define the function in the 'stat' argument instead of
# using its name but then the legend doesn't include the function name
ppc_stat(y, yrep, stat = function(y) quantile(y, 0.25))

# plots by group
color_scheme_set("teal")
group <- example_group_data()
ppc_stat_grouped(y, yrep, group)
ppc_stat_grouped(y, yrep, group) + yaxis_text()

# force y-axes to have same scales, allow x axis to vary
ppc_stat_grouped(y, yrep, group, facet_args = list(scales = "free_x")) + yaxis_text()

# the freqpoly plots use frequency polygons instead of histograms
ppc_stat_freqpoly(y, yrep, stat = "median")
ppc_stat_freqpoly_grouped(y, yrep, group, stat = "median", facet_args = list(nrow = 2))

# ppc_stat_2d allows 2 statistics and makes a scatterplot
bayesplot_theme_set(ggplot2::theme_linedraw())
PPD-distributions

```r
color_scheme_set("viridisE")
ppc_stat_2d(y, yrep, stat = c("mean", "sd"))

bayesplot_theme_set(ggplot2::theme_grey())
color_scheme_set("brewer-Paired")
ppc_stat_2d(y, yrep, stat = c("median", "mad"))

# reset aesthetics
color_scheme_set()
bayesplot_theme_set()
```

---

**Description**

Plot posterior or prior predictive distributions. Each of these functions makes the same plot as the corresponding `ppc_` function but without plotting any observed data `y`. The **Plot Descriptions** section at [PPC-distributions](#) has details on the individual plots.

**Usage**

- `ppd_data(ypred, group = NULL)`
- `ppd_dens_overlay(ypred, ..., size = 0.25, alpha = 0.7, trim = FALSE, bw = "nrd0", adjust = 1, kernel = "gaussian", n_dens = 1024)`

  binwidth = NULL, 
  bins = NULL, 
  freq = TRUE, 
  size = 0.5, 
  alpha = 1
)

ppd_freqpoly_grouped(
  ypred, 
  group, 
  ..., 
  binwidth = NULL, 
  bins = NULL, 
  freq = TRUE, 
  size = 0.5, 
  alpha = 1
)

ppd_boxplot(ypred, ..., notch = TRUE, size = 0.5, alpha = 1)

### Arguments

**ypred**

An $S$ by $N$ matrix of draws from the posterior (or prior) predictive distribution. The number of rows, $S$, is the size of the posterior (or prior) sample used to generate $ypred$. The number of columns, $N$, is the number of predicted observations.

**group**

A grouping variable of the same length as $y$. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

**...**

Currently unused.

**size, alpha**

Passed to the appropriate geom to control the appearance of the predictive distributions.

**trim**

A logical scalar passed to `ggplot2::geom_density()`.

**bw, adjust, kernel, n_dens**

Optional arguments passed to `stats::density()` to override default kernel density estimation parameters. `n_dens` defaults to 1024.

**discrete**

For `ppc_ecdf_overlay()`, should the data be treated as discrete? The default is FALSE, in which case `geom="line"` is passed to `ggplot2::stat_ecdf()`. If `discrete` is set to TRUE then `geom="step"` is used.

**pad**

A logical scalar passed to `ggplot2::stat_ecdf()`.

**binwidth**

Passed to `ggplot2::geom_histogram()` to override the default binwidth.

<tbody>
<tr>
<td>breaks</td>
<td>Passed to <code>ggplot2::geom_histogram()</code> as an alternative to binwidth.</td>
</tr>
<tr>
<td>freq</td>
<td>For histograms, <code>freq=TRUE</code> (the default) puts count on the y-axis. Setting <code>freq=FALSE</code> puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the <code>yaxis_text()</code> convenience function.)</td>
</tr>
<tr>
<td>notch</td>
<td>For the box plot, a logical scalar passed to <code>ggplot2::geom_boxplot()</code>. Note: unlike <code>geom_boxplot()</code>, the default is <code>notch=TRUE</code>.</td>
</tr>
</tbody>
</table>

Details

For Binomial data, the plots may be more useful if the input contains the "success" proportions (not discrete "success" or "failure" counts).

Value

The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

  size = 0.25
)

ppd_ribbon_grouped(
  ypred,
  x = NULL,
  group,
  ..., 
  facet_args = list(),
  prob = 0.5,
  prob_outer = 0.9,
  alpha = 0.33,
  size = 0.25
)
PPD-intervals

ppd_intervals_data(
  ypred,
  x = NULL,
  group = NULL,
  ...,
  prob = 0.5,
  prob_outer = 0.9
)

ppd_ribbon_data(
  ypred,
  x = NULL,
  group = NULL,
  ...,
  prob = 0.5,
  prob_outer = 0.9
)

Arguments

ypred An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate ypred. The number of columns, N, is the number of predicted observations.

x A numeric vector to use as the x-axis variable. For example, x could be a predictor variable from a regression model, a time variable for time-series models, etc. If x is missing or NULL then the observation index is used for the x-axis.

... Currently unused.

prob, prob_outer Values between 0 and 1 indicating the desired probability mass to include in the inner and outer intervals. The defaults are prob=0.5 and prob_outer=0.9.

alpha, size, fatten, linewidth Arguments passed to geoms. For ribbon plots alpha is passed to ggplot2::geom_ribbon() to control the opacity of the outer ribbon and size is passed to ggplot2::geom_line() to control the size of the line representing the median prediction (size=0 will remove the line). For interval plots alpha, size, fatten, and linewidth are passed to ggplot2::geom_pointrange() (fatten=0 will remove the point estimates).

group A grouping variable of the same length as y. Will be coerced to factor if not already a factor. Each value in group is interpreted as the group level pertaining to the corresponding observation.

facet_args A named list of arguments (other than facets) passed to ggplot2::facet_wrap() or ggplot2::facet_grid() to control faceting. Note: if scales is not included in facet_args then bayesplot may use scales="free" as the default (depending on the plot) instead of the ggplot2 default of scales="fixed".
PPD-intervals

Value

The plotting functions return a ggplot object that can be further customized using the `ggplot2` package. The functions with suffix `_data()` return the data that would have been drawn by the plotting function.

  facet_args = list(nrow = 2)
)

# even reducing size, ppd_intervals is too cluttered when there are many
# observations included (ppd_ribbon is better)
ppd_intervals(ypred, size = 0.5, fatten = 0.1, linewidth = 0.5)
ppd_ribbon(ypred)
ppd_ribbon(ypred, size = 0) # remove line showing median prediction
Description

The bayesplot PPD module provides various plotting functions for creating graphical displays of simulated data from the posterior or prior predictive distribution. These plots are essentially the same as the corresponding PPC plots but without showing any observed data. Because these are not "checks" compared to data we use PPD (for prior/posterior predictive distribution) instead of PPC (for prior/posterior predictive check).

PPD plotting functions

The functions for plotting prior and posterior predictive distributions without observed data each have the prefix `ppd_` and all have a required argument `ypred` (a matrix of predictions). The plots are organized into several categories, each with its own documentation:

- **PPD-distributions**: Histograms, kernel density estimates, boxplots, and other plots of multiple simulated datasets (rows) in `ypred`. These are the same as the plots in PPC-distributions but without including any comparison to `y`.

- **PPD-intervals**: Interval estimates for each predicted observations (columns) in `ypred`. The x-axis variable can be optionally specified by the user (e.g. to plot against against a predictor variable or over time). These are the same as the plots in PPC-intervals but without including any comparison to `y`.

- **PPD-test-statistics**: The distribution of a statistic, or a pair of statistics, over the simulated datasets (rows) in `ypred`. These are the same as the plots in PPC-test-statistics but without including any comparison to `y`.

References

See Also

Other PPDs: `PPD-distributions`, `PPD-intervals`, `PPD-test-statistics`
PPD-test-statistics  PPD test statistics

Description
The distribution of a (test) statistic $T(\text{ypred})$, or a pair of (test) statistics, over the simulations from the posterior or prior predictive distribution. Each of these functions makes the same plot as the corresponding `ppc_` function but without comparing to any observed data $y$. The Plot Descriptions section at PPC-test-statistics has details on the individual plots.

Usage

```r
ppd_stat(
  ypred,
  stat = "mean",
  ...
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE
)
```

```r
ppd_stat_grouped(
  ypred,
  group,
  stat = "mean",
  ...
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  breaks = NULL,
  freq = TRUE
)
```

```r
ppd_stat_freqpoly(
  ypred,
  stat = "mean",
  ...
  facet_args = list(),
  binwidth = NULL,
  bins = NULL,
  freq = TRUE
)
```

```r
ppd_stat_freqpoly_grouped(
  ypred,
  group,
```
```r
df = df

stat = "mean",
...,
facet_args = list(),
binwidth = NULL,
bins = NULL,
freq = TRUE
)

ppd_stat_2d(ypred, stat = c("mean", "sd"), ..., size = 2.5, alpha = 0.7)

ppd_stat_data(ypred, group = NULL, stat)
```

**Arguments**

**ypred**  
An S by N matrix of draws from the posterior (or prior) predictive distribution. The number of rows, S, is the size of the posterior (or prior) sample used to generate `ypred`. The number of columns, N, is the number of predicted observations.

**stat**  
A single function or a string naming a function, except for the 2D plot which requires a vector of exactly two names or functions. In all cases the function(s) should take a vector input and return a scalar statistic. If specified as a string (or strings) then the legend will display the function name(s). If specified as a function (or functions) then generic naming is used in the legend.

...  
Currently unused.

**binwidth**  
Passed to `ggplot2::geom_histogram()` to override the default binwidth.

**bins**  
Passed to `ggplot2::geom_histogram()` to override the default binwidth.

**breaks**  
Passed to `ggplot2::geom_histogram()` as an alternative to `binwidth`.

**freq**  
For histograms, `freq=TRUE` (the default) puts count on the y-axis. Setting `freq=FALSE` puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the `yaxis_text()` convenience function.)

**group**  
A grouping variable of the same length as y. Will be coerced to `factor` if not already a factor. Each value in `group` is interpreted as the group level pertaining to the corresponding observation.

**facet_args**  
A named list of arguments (other than facets) passed to `ggplot2::facet_wrap()` or `ggplot2::facet_grid()` to control faceting. Note: if `scales` is not included in `facet_args` then `bayesplot` may use `scales="free"` as the default (depending on the plot) instead of the `ggplot2` default of `scales="fixed"`.

**size, alpha**  
For the 2D plot only, arguments passed to `ggplot2::geom_point()` to control the appearance of scatterplot points.

**Details**

For Binomial data, the plots may be more useful if the input contains the "success" proportions (not discrete "success" or "failure" counts).
Value

The plotting functions return a ggplot object that can be further customized using the ggplot2 package. The functions with suffix _data() return the data that would have been drawn by the plotting function.

References

See Also

Other PPDs: PPD-distributions, PPD-intervals, PPD-overview

Examples

```r
yrep <- example_yrep_draws()
ppd_stat(yrep)
ppd_stat(yrep, stat = "sd") + legend_none()

# use your own function for the 'stat' argument
color_scheme_set("brightblue")
q25 <- function(y) quantile(y, 0.25)
ppd_stat(yrep, stat = "q25") # legend includes function name
```

S3 generic with simple default method. The intent is to provide a generic so authors of other R packages who wish to provide interfaces to the functions in bayesplot will be encouraged to include pp_check() methods in their package, preserving the same naming conventions for posterior (and prior) predictive checking across many R packages for Bayesian inference. This is for the convenience of both users and developers. See the Details and Examples sections, below, and the package vignettes for examples of defining pp_check() methods.

Usage

```r
pp_check(object, ...)
```

## Default S3 method:
```r
pp_check(object, yrep, fun, ...)
```
Arguments

- **object**: Typically a fitted model object. The default method, however, takes object to be a y (outcome) vector.
- **...**: For the generic, arguments passed to individual methods. For the default method, these are additional arguments to pass to fun.
- **yrep**: For the default method, a yrep matrix passed to fun.
- **fun**: For the default method, the plotting function to call. Can be any of the PPC functions. The "ppc_" prefix can optionally be dropped if fun is specified as a string.

Details

A package that creates fitted model objects of class "foo" can include a method **pp_check.foo()** that prepares the appropriate inputs (y, yrep, etc.) for the **bayesplot** functions. The **pp_check.foo()** method may, for example, let the user choose between various plots, calling the functions from **bayesplot** internally as needed. See **Examples**, below, and the package vignettes.

Value

The exact form of the value returned by **pp_check()** may vary by the class of object, but for consistency we encourage authors of methods to return the ggplot object created by one of **bayesplot**’s plotting functions. The default method returns the object returned by fun.

Examples

```r
# default method
y <- example_y_data()
yrep <- example_yrep_draws()
pp_check(y, yrep[1:50,], ppc_dens_overlay)

g <- example_group_data()
pp_check(y, yrep, fun = "stat_grouped", group = g, stat = "median")

# defining a method
x <- list(y = rnorm(50), yrep = matrix(rnorm(5000), nrow = 100, ncol = 50))
class(x) <- "foo"
pp_check.foo <- function(object, ..., type = c("multiple", "overlaid")) {
  y <- object[["y"]]
yrep <- object[["yrep"]]
  switch(match.arg(type),
    multiple = ppc_hist(y, yrep[1:min(8, nrow(yrep))], drop = FALSE),
    overlaid = ppc_dens_overlay(y, yrep))
}
pp_check(x)
pp_check(x, type = "overlaid")
```
theme_default

Description

The `theme_default()` function returns the default ggplot theme used by the `bayesplot` plotting functions. See `bayesplot_theme_set()` for details on setting and updating the plotting theme.

Usage

```r
theme_default(
  base_size = getOption("bayesplot.base_size", 12),
  base_family = getOption("bayesplot.base_family", "serif")
)
```

Arguments

`base_size, base_family`

Base font size and family (passed to `ggplot2::theme_bw()`). It is possible to set "bayesplot.base_size" and "bayesplot.base_family" via `options()` to change the defaults, which are 12 and "serif", respectively.

Value

A ggplot theme object.

See Also

`bayesplot_theme_set()` to change the ggplot theme.

`bayesplot-colors` to set or view the color scheme used for plotting.

`bayesplot-helpers` for a variety of convenience functions, many of which provide shortcuts for tweaking theme elements after creating a plot.

Examples

```r
class(theme_default())

bayesplot_theme_set() # defaults to setting theme_default()
x <- example_mcmc_draws()
mcmc_hist(x)

# change the default font size and family for bayesplots
bayesplot_theme_set(theme_default(base_size = 8, base_family = "sans"))
mcmc_hist(x)
mcmc_areas(x, regex_pars = "beta")

# change back
bayesplot_theme_set()
```
tidy-params

mcmc_areas(x, regex_pars = "beta")

tidy-params Tidy parameter selection

Description
Parameter selection in the style of **dplyr** and other tidyverse packages.

Usage

```r
param_range(prefix, range, vars = NULL)
param_glue(pattern, ..., vars = NULL)
```

Arguments

- `prefix, range` For `param_range()` only, `prefix` is a string naming a parameter and `range` is an integer vector providing the indices of a subset of elements to select. For example, using

  ```r
  param_range("beta", c(1,2,8))
  ```

  would select parameters named `beta[1]`, `beta[2]`, and `beta[8]`. `param_range()` is only designed for the case that the indices are integers surrounded by brackets. If there are no brackets use `num_range()`.

- `vars` NULL or a character vector of parameter names to choose from. This is only needed for the atypical use case of calling the function as a standalone function outside of `vars()`, `select()`, etc. Typically this is left as NULL and will be set automatically for the user.

- `pattern, ...` For `param_glue()` only, `pattern` is a string containing expressions enclosed in braces and `...` should be named arguments providing one character vector per expression in braces in `pattern`. It is easiest to describe how to use these arguments with an example:

  ```r
  param_glue("beta_{var}[{level}]",
              var = c("age", "income"),
              level = c(3,8))
  ```

  would select parameters with names "beta_age[3]", "beta_income[3]", "beta_age[8]", "beta_income[8]".
Details

As of version 1.7.0, bayesplot allows the pars argument for MCMC plots to use "tidy" variable selection (in the style of the dplyr package). The vars() function is re-exported from dplyr for this purpose.

Features of tidy selection includes direct selection (vars(alpha, sigma)), everything-but selection (vars(-alpha)), ranged selection (vars(\('beta[1]\':\('beta[3]\'))), support for selection functions (vars(starts_with("beta"))), and combinations of these features. See the Examples section, below.

When using pars for tidy parameter selection, the regex_pars argument is ignored because bayesplot supports using tidyselect helper functions (starts_with(), contains(), num_range(), etc.) for the same purpose. bayesplot also exports some additional helper functions to help with parameter selection:

- **param_range()**: like num_range() but used when parameter indexes are in brackets (e.g. beta[2]).
- **param_glue()**: for more complicated parameter names with multiple indexes (including variable names) inside the brackets (e.g., beta[(Intercept) age_group:3]).

These functions can be used inside of vars(), dplyr::select(), and similar functions, just like the tidyselect helper functions.

Extra Advice

Parameter names in vars() are not quoted. When the names contain special characters like brackets, they should be wrapped in backticks, as in vars(\('beta[1]\')).

To exclude a range of variables, wrap the sequence in parentheses and then negate it. For example, vars(-\('beta[1]\':\('beta[3]\')))) would exclude beta[1], beta[2], and beta[3].

vars() is a helper function. It holds onto the names and expressions used to select columns. When selecting variables inside a bayesplot function, use vars(...): mcmc_hist(data, pars = vars(alpha)). When using select() to prepare a dataframe for a bayesplot function, do not use vars(): data %>% select(alpha) %>% mcmc_hist().

Internally, tidy selection works by converting names and expressions into position numbers. As a result, integers will select parameters; vars(1, 3) selects the first and third ones. We do not endorse this approach because positions might change as variables are added and removed from models. To select a parameter that happens to be called 1, use backticks to escape it vars(\('1\')).
