Package ‘crplyr’

April 24, 2020

Type Package

Title A 'dplyr' Interface for Crunch

Description In order to facilitate analysis of datasets hosted on the Crunch data platform <http://crunch.io/>, the 'crplyr' package implements 'dplyr' methods on top of the Crunch backend. The usual methods 'select', 'filter', 'group_by', 'summarize', and 'collect' are implemented in such a way as to perform as much computation on the server and pull as little data locally as possible.

Version 0.3.4

BugReports https://github.com/Crunch-io/crplyr/issues

License LGPL (>= 3)

Depends R (>= 3.0.0), crunch (>= 1.15.3), dplyr

Imports methods, ggplot2, lazyeval, lifecycle, purrr, tibble, rlang, scales, stringr, tidyselect, viridisLite

Suggests covr, httptest (>= 3.0.0), magrittr, spelling, vdiffr, knitr, testthat, rmarkdown

RoxygenNote 7.1.0

Language en-US

VignetteBuilder knitr

NeedsCompilation no

Repository CRAN

Date/Publication 2020-04-24 16:10:05 UTC
Description

Crunch Cubes can be expressed as a long data frame instead of a multidimensional array. In this form each dimension of the cube is a variable and the cube values are expressed as columns for each measure. This is useful both to better understand what each entry of a cube represents, and to work with the cube result using tidyverse tools.

Usage

as_cr_tibble(x, ...)

Arguments

x  
a CrunchCube

...  
further arguments passed on to tibble::as_tibble()

Details

The cr_tibble class is a subclass of tibble that has extra metadata to allow ggplot::autoplot() to work. If you find that this extra metadata is getting in the way, you can use as_tibble() to get a true tibble.
Description

The Crunch autoplot methods generate ggplots that are tailored to various Crunch objects. This allows you to visualize the object without bringing it into memory. You can select between three families of plots, which will attempt to accommodate the dimensionality of the plotted object. These plots can be further extended and customized with other ggplot methods.

Usage

```r
## S3 method for class 'DatetimeVariable'
autoplot(x, ...)

## S3 method for class 'NumericVariable'
autoplot(x, ...)

## S3 method for class 'CategoricalVariable'
autoplot(x, ...)

## S3 method for class 'CategoricalArrayVariable'
autoplot(x, ...)

## S3 method for class 'MultipleResponseVariable'
autoplot(x, ...)

## S3 method for class 'CrunchCube'
autoplot(x, ...)

## S3 method for class 'CrunchCubeCalculation'
autoplot(x, plot_type = "dot", ...)

## S3 method for class 'tbl_crunch_cube'
autoplot(x, plot_type = c("dot", "tile", "bar"), measure)
```

Arguments

- `x`: A Crunch variable or cube aggregation
- `...`: Additional plotting arguments
- `plot_type`: One of "dot", "tile", or "bar" which indicates the plot family you would like to use. Higher dimensional plots add color coding or facets depending on the dimensionality of the data.
- `measure`: The measure you wish to plot. This will usually be "count", the default but can also be ".unweighted_counts" or any other measure stored in the cube. If omitted, autoplot will select the first measure appearing in the data.
collect

Collect a Crunch dataset from the server

Description

This function brings a Crunch dataset into memory so that you can work with the data using R functions. Since this can create a long running query it is recommended that you try to filter the dataset down as much as possible before running collect().

Usage

```r
## S3 method for class 'CrunchDataset'
collect(x, ...)
## S3 method for class 'GroupedCrunchDataset'
collect(x, ...)
```

Arguments

- `x` A Crunch Dataset
- `...` Other arguments passed to `crunch::as.data.frame()`

Details

When collecting a grouped CrunchDataset, the grouping will be preserved.

Value

A tbl_df or grouped_df

Examples

```r
## Not run:
ds %>%
grup_by(cyl) %>%
select(cyl, gear) %>%
collect()

## End(Not run)
```
filter

Filter a Crunch dataset

Description

This function applies a CrunchLogicalExpression filter to a CrunchDataset. It's a "tidy" way of doing ds[ds$var == val,].

Usage

```r
## S3 method for class 'CrunchDataset'
filter(.data, ..., .preserve = FALSE)
```

Arguments

- `.data` A CrunchDataset
- `...` filter expressions
- `.preserve` Relevant when the `.data` input is grouped. If `.preserve = FALSE` (the default), the grouping structure is recalculated based on the resulting data, otherwise the grouping is kept as is.

Value

`.data` with the filter expressions applied.

Examples

```r
## Not run:
ds %>%
  select(cyl, gear) %>%
  filter(cyl > 4) %>%
  collect()

## End(Not run)
```

filter_.CrunchDataset  Filter a Crunch dataset (deprecated)

Description

This function is deprecated, use `filter()` instead. Applies a CrunchLogicalExpression filter to a CrunchDataset. It's a "tidy" way of doing ds[ds$var == val,].

Usage

```r
## S3 method for class 'CrunchDataset'
filter_.(.data, ..., .dots)
```
Arguments

.data A CrunchDataset
... filter expressions
.dots More dots!

Value

.data with the filter expressions applied.

GroupedCrunchDataset-class
A Crunch Dataset "Grouped By" Something

Description

This is a subclass of crunch::CrunchDataset that has a field for recording "group_by" expressions.

Examples

## Not run:
ds <- loadDataset("Your dataset name")
class(ds) ## "CrunchDataset"
grouped_ds <- group_by(ds, var1)
class(grouped_ds) ## "GroupedCrunchDataset"

## End(Not run)

group_by Group-by for Crunch datasets

Description

group_by() sets grouping variables that affect what summarize() computes. ungroup() removes any grouping variables.

Usage

## S3 method for class 'CrunchDataset'
group_by(.data, ..., .add = FALSE)

## S3 method for class 'CrunchDataset'
ungroup(x, ...)
mutate

Arguments

.data For group_by(), a Crunch Dataset
... references to variables to group by, passed to dplyr::group_by_prepare()
.add Logical: add the variables in ... to any existing grouping variables, or replace them (the default).
x For ungroup(), a Crunch Dataset

Details

Note that group_by() only supports grouping on variables that exist in the dataset, not ones that are derived on the fly. dplyr::group_by() supports that by calling mutate() internally, but mutate is not yet supported in crplyr.

Value

group_by() returns a GroupedCrunchDataset object (a CrunchDataset with grouping annotations). ungroup() returns a CrunchDataset.

Examples

## Not run:
ds %>%
group_by(cyl) %>%
select(cyl, gear) %>%
collect()

## End(Not run)

mutate Mutate Crunch datasets (not implemented)

Description

Just a method that returns a nicer error message. mutate() hasn’t been implemented yet. You can, however, derive expressions on the fly in summarize().

Usage

## S3 method for class 'CrunchDataset'
mutate(.data, ...)

Arguments

.data A crunch Dataset
... Other arguments, currently ignored
select

Select columns from a Crunch dataset

Description
This function uses "tidy select" methods of subsetting the columns of a dataset. It's another way of doing ds[,vars].

Usage
## S3 method for class 'CrunchDataset'
select(.data, ...)

Arguments
.data A CrunchDataset
...

names of variables in .data or other valid selection functions, passed to tidyselect::vars_select()

Value
.data with only the selected variables.

Examples
## Not run:
ds %>%
  select(contains("ear")) %>%
  filter(gear > 4) %>%
  collect()

## End(Not run)

summarize

Aggregate a Crunch dataset

Description
This is an alternate interface to crunch::crtabs() that, in addition to being "tidy", makes it easier to query multiple measures at the same time.

Usage
## S3 method for class 'CrunchDataset'
summarise(.data, ...)

**theme_crunch**

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.data</td>
<td>A CrunchDataset</td>
</tr>
<tr>
<td>...</td>
<td>named aggregations to include in the resulting table.</td>
</tr>
</tbody>
</table>

Details

Note that while `mutate()` is not generally supported in crplyr, you can derive expressions on the fly in `summarize()`.

Value

A `tbl_crunch_cube` or `cr_tibble` of results. This subclass of `tibble` allows `ggplot2::autoplot` to work, but can get in the way in some tidyverse operations. You may wish to convert to a `tibble` using `as_tibble()`.

Examples

```r
## Not run:
ds %>%
  filter(cyl == 6) %>%
  group_by(vs) %>%
  summarize(hp=mean(hp), sd_hp=sd(hp), count=n())
## End(Not run)
```

---

### Theme Crunch

**Crunch ggplot theme**

**Description**

Style ggplots according to Crunch style.

**Usage**

```r
theme_crunch(base_size = 12, base_family = "sans")
```

**Arguments**

- `base_size` Base text size
- `base_family` Base text family
unweighted_n  

Return the unweighted counts from summarize

---

**Description**

This function allows you to return the unweighted counts from a Crunch dataset or grouped crunch dataset. It can only be used from within a `summarise()` call. If your dataset is unweighted, then `unweighted_n()` is equivalent to `n()`.

**Usage**

```r
unweighted_n()
```

**Examples**

```r
## Not run:
ds %>%
  group_by(cyl) %>%
  summarise(
    raw_counts = unweighted_n(),
    mean = mean(wt)
  )

## End(Not run)
```
