**initialize_network**

Initialize a mineral-chemistry network as stand-alone network rather than for embedding into the Shiny App.

**Description**

Initialize a mineral-chemistry network as stand-alone network rather than for embedding into the Shiny App.

**Usage**

```r
initialize_network(
  elements_of_interest,
  force_all_elements = FALSE,
  elements_by_redox = FALSE,
  restrict_to_elements = FALSE,
  ignore_na_redox = FALSE,
  age_range = c(0, 5),
  max_age_type = "Maximum",
  cluster_algorithm = "Louvain",
  use_data_cache = TRUE
)
```

**Arguments**

- `elements_of_interest`  
  An array of specified elements whose minerals should be included in the network. For all elements, specify "all".

- `force_all_elements`  
  A logical. If FALSE (default), minerals containing any of `elements_of_interest` will be included in network. If TRUE, only minerals with full intersection of all specified elements will be included in network.
initialize_network

elements_by_redox
A logical. If FALSE (default), element nodes will be constructed regardless of redox state. If TRUE, creates separate node for each element’s redox state, e.g. Fe2+ and Fe3+ would be separate nodes.

restrict_to_elements
A logical. If FALSE (default), constructed network will _only_ contain the specified focal element(s)

ignore_na_redox
A logical. If TRUE and elements_by_redox is TRUE, element nodes without redox states will be removed from the network.

age_range
A array of two numbers giving inclusive range of mineral ages in Ga to include in network.

max_age_type
A string indicating how mineral ages should be assessed. If "Maximum" (default), filters minerals using maximum known ages at localities. If "Minimum", filters minerals using minimum known ages at localities.

cluster_algorithm
A string giving community clustering algorithm, one of "Louvain" (default) or "Leading eigenvector".

use_data_cache
A logical. If TRUE (default) cached Mineral Evolution Database will be used to build the network. If FALSE, data will be fetched from MED here. CAUTION: Requires internet connection and will take several minutes to update.

Value
Named list containing an igraph-formatted network (‘network’), an igraph::communities object giving node cluster memberships (‘clustering’), a tibble of nodes associated metadata (‘nodes’), and a tibble of edges and associated metadata (‘edges’), and a tibble of mineral locality information (‘locality_info’)

Examples
## Not run:
# Include all Iron minerals whose maximum known age is between 1-2 Gya, and apply
# Louvain community clustering
initialize_network("Fe", age_range = c(1,2))

# Include all minerals containing either Iron and Oxygen whose maximum known age
# is between 1-2 Gya
initialize_network(c("Fe", "O"), age_range = c(1,2))

# Include all minerals containing both Iron and Oxygen whose maximum known age is
# between 1-2 Gya
initialize_network(c("Fe", "O"), force_all_elements = TRUE, age_range = c(1,2))

# Build the full mineral network
initialize_network("all")

## End(Not run)
run_app

Run the "dragon" Shiny Application

Description
Run the "dragon" Shiny Application

Usage
run_app()

Examples
```r
## Not run:
library(dragon)
dragon::run_app()
## End(Not run)
```

run_dragon

Run the "dragon" Shiny Application. Wrapper for dragon::run_app().

Description
Run the "dragon" Shiny Application. Wrapper for dragon::run_app().

Usage
run_dragon()

Examples
```r
## Not run:
library(dragon)
dragon::run_dragon()
## End(Not run)
```
