Package ‘egor’

February 2, 2024

Type Package

Title Import and Analyse Ego-Centered Network Data

Version 1.24.2

Date 2024-02-01

Description Tools for importing, analyzing and visualizing ego-centered network data. Supports several data formats, including the export formats of 'EgoNet', 'EgoWeb 2.0' and 'openeddi'. An interactive (shiny) app for the intuitive visualization of ego-centered networks is provided. Also included are procedures for creating and visualizing Clustered Graphs (Lerner 2008 <DOI:10.1109/PACIFICVIS.2008.4475458>).

BugReports https://github.com/tilltnet/egor/issues

License AGPL-3

Depends R (>= 3.5.0), dplyr, tibble

Imports tidygraph, srvyr, tidyr, methods, utils, purrr, rlang, pillar

Suggests knitr, testthat (>= 2.1.0), rmarkdown, survey, shiny, igraph, network, haven

VignetteBuilder knitr

aaties32

**Description**

32 sets of randomly created alter-alter ties belonging to ego-centered networks

**Usage**

aaties32

**Format**

A data frame with 32 sets of alter-alter relations and 4 variables:

- **.EGOID** ego identifier
- **.SRCID** source alter ID
- **.TGTID** target alter ID
- **weight** weight of relation

**activate.egor** *Activate ego, alter or alter-alter tie data level of an egor dataset*

**Description**

This function activates one of the data levels of an egor dataset, so that the dplyr verbs know which level to execute on.

**Usage**

```r
## S3 method for class 'egor'
activate(.data, what)
```

**Arguments**

- **.data** The egor dataset.
- **what** Character naming the level to activate, this can be "ego", "alter" or "aatie".

**Examples**

```r
e <- make_egor(5,50)
e %>%
  activate("aatie") %>%
  mutate(weight2 = 2 + weight) %>%
  activate("alter") %>%
  mutate(age.years = age.years^3)
```
allbus_2010_simulated  Simulated Allbus 2010 Data

Description
A dataset simulated based on the original Allbus 2010 SPSS data. The dataset simulates 100 respondents and does not resemble any actual Allbus respondents. Each variable is randomly generated based on the range of the original variables, co-variations between variables are disregarded. The data’s purpose is purely to demonstrate how to technically work with the Allbus data using egor and R - no analytical assumptions should be made based on this data!

Usage
allbus_2010_simulated

Format
A tibble/data.frame of 100 simulated respondents/rows and 981 variables/columns. Each variable is a labelled dbl.

Details
The dataset contains (simulated!) answers to two ego-centered name generators.

alters32  32 sets of randomly created alters belonging to ego-centered networks

Description
32 sets of randomly created alters belonging to ego-centered networks

Usage
alters32

Format
A data frame with 32 sets of up to 32 alters per egoID and 7 variables:

.ALTTID alter identifier
.EGOID ego identifier
age age in categories
age.years age in years
country country
income income
sex gender
**alter_design**

*Set and query the alter nomination design*

**Description**

Extract, set, or update the alter nomination design associated with an ego-centered dataset.

**Usage**

```r
alter_design(x, ...) 

## S3 method for class 'egor'
alter_design(x, which, ...) 

alter_design(x, ...) <- value 

## S3 replacement method for class 'egor'
alter_design(x, which, ...) <- value 
```

**Arguments**

- `x` an *egor* object.
- `...` arguments to be passed to methods
- `which` name of the alter design setting to query or replace
- `value` if `which` is specified, the new value of the attribute; if not, a named list of settings that replace their old values.

**alts_diversity_count**

*Calculate diversity measures on an egor object.*

**Description**

`alts_diversity_count()` counts the categories of a variable present in the networks of an egor object. `alts_diversity_entropy()` calculates the Shannon entropy as a measurement for diversity of an alter attribute.

**Usage**

```r
alts_diversity_count(object, alt.attr) 

alts_diversity_entropy(object, alt.attr, base = 2) 
```
Arguments

- **object**: An egor object.
- **alt.attr**: A character naming the variable containing the alter-attribute.
- **base**: Numeric, base value of logarithm for entropy calculation.

Value

A tibble with the ego ID and a numeric result vector.

Author(s)

Michał Bojanowski, <michal2992@gmail.com>
Till Krenz, <egor@tillt.net>

Examples

```r
data("egor32")
alts_diversity_count(egor32, "age")
alts_diversity_entropy(egor32, "age")
```

Description

These work like dplyr’s bind_cols() and bind_rows(). The first argument has to be an egor object. Additional rows/columns are added bottom/RHS of the active data level (ego, alter, aatie).

Usage

```r
append_rows(.egor, ..., .id = NULL)
```

```r
append_cols(.egor, ...)
```

Arguments

- **.egor**: An egor object.
- **...**: Data frames to combine.
- **.id**: Data frame identifier.

Value

egor object containing the additional rows/ columns on the active level.
Examples

```r
e <- make_egor(12, 15)

# Adding a column to the ego level
additional_ego_columns <-
  tibble(x = sample(1:3, 12, replace = TRUE))
append_cols(e, additional_ego_columns)

# Adding rows to the ego and alter level
additional_ego_rows <-
  list(
    .egoID = 13,
    sex = "w",
    age = factor("56 - 65"),
    age.years = 60,
    country = "Australia"
  ) %>%
  as_tibble()

additional_alter_rows <-
  list(
    .altID = 1:5,
    .egoID = rep(13, 5),
    sex = sample(c("f", "m"), 5, replace = TRUE)
  ) %>%
  as_tibble()
append_rows(e, additional_ego_rows) %>%
  activate(alter) %>%
  append_rows(additional_alter_rows)
```

Description

The function `egor()` is used to create an egor object from ego-centered network data. `as.egor()` converts a list of igraph/network objects or a nested_egor objects to an egor object.

Usage

```r
as.egor(x, ...)
```

## S3 method for class 'nested_egor'

```r
as.egor(
  x,
  ID.vars = list(ego = ".egoID", alter = ".alterID", source = ".Source", target = ".Target"),
```
as.egor

## S3 method for class 'list'
as.egor(x, ego_name = NULL, ...)

egor(
  alters,
  egos = NULL,
  aaties = NULL,
  ID.vars = list(ego = "egoID", alter = "alterID", source = "Source", target = "Target"),
  ego_design = NULL,
  alter_design = list(max = Inf)
)

Arguments

- **x**: list of igraph/network objects representing ego networks.
- **...**: arguments to be passed to methods
- **ID.vars**: A named list containing column names of the relevant input columns:
  - `ego`: unique identifier associated with each ego, defaulting to "egoID"; has no effect if `alters.df` and `aaties.df` are both lists of data frames.
  - `alter`: unique-within-ego identifier associated with each alter, defaulting to "alterID"; optional if `aaties.df` are not provided.
  - `source`: if `aaties.df` is provided, the column given the alter identifier of the origin of a relation.
  - `target`: if `aaties.df` is provided, the column given the alter identifier of the destination of a relation.
- **ego_name**: character or numeric of length one or same length as there are networks. If the igraph/network objects don’t include egos as a node, set to NULL (default).
- **alters**: either a data.frame containing the alters (whose nominator is identified by the column specified by `egoID` or a list of data frames with the same columns, one for each ego, with empty data frames or NULLs corresponding to egos with no nominees.
- **egos**: data.frame containing the egos.
- **aaties**: data.frame containing the alter-alter relations in the style of an edge list, or a list of data frames similar to `alters.df`.
- **ego_design**: A list of arguments to `srvyr::as_survey_design()` specifying the sampling design for the egos. If formulas, they can refer to columns of `egos.df`. NULL means that no design is set.
- **alter_design**: A list of arguments specifying nomination information. Currently, the following elements are supported:
  - "max": Maximum number of alters that an ego can nominate.
Details

If parameters `alters.df`, `egos.df`, and `aaties.df` are data frames, they need to share a common ego ID variable, with corresponding values. If `alters.df` and `aaties.df` are lists of data frames, `egoID` is ignored and they are matched by position with the rows of `egos.df`. Of the three parameters only `alters.df` is necessary to create an `egor` object, and `egos.df` and `aaties.df` are optional.

Value

Returns an `egor` object, which is a named list with three tibble data frames: ego, alter and aatie (alter-alter ties). Each data set has an .egoID column, that groups the data belonging to one ego. Additionally the alter data has an .alterID column, that links to the columns .srcID and .tgtID in the alter-alter tie data.

In addition, `egor` has two attributes: ego_design, containing an object returned by `srvyr::as_survey_design()` specifying the sampling design by which the egos were selected and alter_design, a list containing specification of how the alters were nominated. See the argument above for currently implemented settings.

Functions

- `as.egor(nested_egor)`: Can convert (legacy) `nested_egor` object to `egor` object.

Note

Column names .alts, .aaties, and .egoRow are reserved for internal use of `egor` and should not be used to store persistent data. Other .-led column names may be reserved in the future.

See Also

- `as_tibble()` for extracting ego, alter, and alter–alter tables, as tibbles or as srvyr’s tbl_svy surveys.

Examples

data("egos32")
data("alters32")
data("aaties32")

`egor(alters32, egos32, aaties32, ID.vars = list(ego = ".EGOID", alter = ".ALTID", source = ".SRCID", target = ".TGTID")`
as_igraph

Convert egor object to network or igraph objects

Description

These functions convert an egor object into a list of network or igraph objects. By default ego itself is not included in the created objects, there is a parameter (include.ego) that allows for including ego.

Usage

as_igraph(
  x,
  directed = FALSE,
  include.ego = FALSE,
  ego.attrs = NULL,
  ego.alter.weights = NULL,
  graph.attrs = ".egoID"
)

## S3 method for class 'nested_egor'
as_igraph(
  x,
  directed = FALSE,
  include.ego = FALSE,
  ego.attrs = NULL,
  ego.alter.weights = NULL,
  graph.attrs = ".egoID"
)

## S3 method for class 'egor'
as_igraph(
  x,
  directed = FALSE,
  include.ego = FALSE,
  ego.attrs = NULL,
  ego.alter.weights = NULL,
  graph.attrs = ".egoID"
)

as_network(
  x,
  directed = FALSE,
  include.ego = FALSE,
  ego.attrs = NULL,
  ego.alter.weights = NULL,
  graph.attrs = ".egoID"
)
## S3 method for class 'egor'
as.network(
   x,
   directed = FALSE,
   include.ego = FALSE,
   ego.attrs = NULL,
   ego.alter.weights = NULL,
   graph.attrs = ".egoID"
)

### Arguments

- **x**: An egor object.
- **directed**: Logical, indicating if alter-alter relations are directed.
- **include.ego**: Logical. Should ego be included?
- **ego.attrs**: Vector of names (character) or indices (numeric) of ego variables that should be carried over to the network/igraph objects. This is ignored, when `include.ego = FALSE` (default).
- **ego.alter.weights**: Vector of names (character) or indices (numeric) of alter variables that should be carried over to the the network/igraph objects, as edge attributes of the ego-alter relations. This is ignored, when `include.ego = FALSE` (default).
- **graph.attrs**: Vector of names (character) or indices (numeric) of ego variables that are supposed to be carried over to the igraph object as graph attributes or the network object as network attributes. By default `.egoID` is carried over.

### Details

The names of the variables specified in `ego.attr` and `ego.alter.attr` need to be the same as the names of corresponding alter attributes, in order for those variables to be merged successfully in the resulting network/igraph object (see example).

### Examples

```r
e <- make_egor(3, 22)
as_igraph(e)
```

### as_tibble.egor

Extract ego, alter, and alter-alter tables from an egor object.
Description
Provided an egor object, these functions create a "global" tibble or srvyr’s tbl_svy object containing egos, alter attributes, or alter-alter relations. The resulting tables are useful for advanced analysis procedures, e.g. multi-level regressions.

as_tibble() method for egor extracts the currently active component (ego, alter, or aaties) table, optionally joining it with the others, dropping any survey design information.
as_survey() method for egor instead returns a srvyr tbl_svy survey, taking into account any replication due to multiple alters or alter-alter ties incident on each ego. If no design is specified for the egos, then the default design (simple random sample with replacement) is assumed as the starting point.
as_egos_df(), as_alters_df(), as_aaties_df(), as_egos_survey(), as_alters_survey(), and as_aaties_survey() are convenience functions for the as_tibble() and as_survey() methods, activating the corresponding component of the egor object.

Usage
## S3 method for class 'egor'
as_tibble(x, ..., include.ego.vars = FALSE, include.alter.vars = FALSE)
as_survey(.data, ..., include.ego.vars = FALSE, include.alter.vars = FALSE)
as_egos_df(object)
as_alters_df(object, include.ego.vars = FALSE)
as_aaties_df(object, include.ego.vars = FALSE, include.alter.vars = FALSE)
as_egos_survey(object, include.ego.vars = FALSE)
as_alters_survey(object, include.ego.vars = FALSE)
as_aaties_survey(object, include.ego.vars = FALSE, include.alter.vars = FALSE)

Arguments
x, object, .data
An egor object.
...
Additional arguments, currently unused.
include.ego.vars
Logical, specifying if ego variables should be included in the result.
include.alter.vars
Logical, specifying if alter variables should be included in the result.

Value
A tibble for the as_tibble and *_df functions and a tbl_svy for as_survey and the *_survey functions.
Examples

# Load example data
data(egor32)

as_tibble(egor32) # Ego table.

egor32 %>%
  activate("alter") %>%
  as_tibble(include.ego.vars=TRUE) # Alter table, but also with ego variables.

library(srvyr)

as_survey(egor32) # Ego table with survey design.

# Despite alter table being active, obtain the ego table.
(egor32 <- activate(egor32, "alter"))

as_egos(df(egor32)

# Create global alter table

as_alters(df(egor32)

# Create global alter-alter relations table

as_aaties(df(egor32)

# ... adding alter variables

as_aaties(df(egor32, include.alter.vars = TRUE)

as_egos_survey(egor32)

as_alters_survey(egor32) # Notice the resulting cluster design.

clustered_graphs

Cluster ego-centered networks by a grouping factor

Description

The idea of clustered graphs is to reduce the complexity of an ego-centered network graph by visualizing alters in clusters defined by a categorical variable (Lerner et al. 2008). clustered_graphs() calculates group sizes, inter and intra group tie densities and returns these informations in a list of igraph objects.

Usage

clustered_graphs(object, ..., clust.groups)

## S3 method for class 'list'
clustered_graphs(object, aaties, clust.groups, ...)

## S3 method for class 'egor'
clustered_graphs(object, clust.groups, ...)

## S3 method for class 'data.frame'
clustered_graphs(object, aaties, clust.groups, egoID = ".egoID", ...)
composition

Calculate the composition of alter attributes in an egor object

Description

composition() calculates the proportional or absolute composition of alters for a given attribute/variable.

Usage

composition(object, alt.attr, absolute = FALSE)
**comp_ei**

**Arguments**

- **object**: An egor object.
- **alt.attr**: A character naming the variable containing the alter-attribute.
- **absolute**: Logical indicating if the results should be absolute.

**Value**

A tibble with the ego ID and values per category of `alt.attr` as numeric columns.

**Examples**

```r
data("egor32")
composition(egor32, "sex")
```

**Description**

`comp_ei()` calculates the EI-Index values as a measurement for ego-alter homo-/heterophily.

**Usage**

```r
comp_ei(object, alt.attr, ego.attr)
```

**Arguments**

- **object**: An egor object.
- **alt.attr**: A character naming the variable containing the alter-attribute.
- **ego.attr**: A character naming an ego attribute.

**Value**

A tibble with the ego ID and a numeric result vector.

**Examples**

```r
data("egor32")
comp_ei(egor32, "age", "age")
```
**comp_ply**

*Calculate custom compositional measures on an egor object*

**Description**

`comp_ply()` applies a function, that uses an alter attribute to calculate a compositional measurement, on all networks in an egor object and returns a numeric vector.

**Usage**

```r
comp_ply(object, alt.attr, .f, ..., ego.attr = NULL, result.name = "result")
```

**Arguments**

- `object`: An egor object.
- `alt.attr`: A character naming the variable containing the alter-attribute.
- `.`: A function that returns a numeric.
- `...`: Optional arguments to `.f`.
- `ego.attr`: Optional character naming an ego attribute.
- `result.name`: Optional character naming the result column.

**Details**

When an ego attribute is used the `.f` is called like this: `.f(alt.attr, ego.attr, ...)`. `.f` must return a single numeric value.

**Value**

A tibble with the ego ID and a numeric result vector.

**Author(s)**

Michał Bojanowski, <michal2992@gmail.com>
Till Krenz, <egor@tillt.net>

**Examples**

```r
df <- make_egor(10, 32)
comp_ply(df, "age.years", sd, na.rm = TRUE)
```
`count_dyads()` counts the attribute combinations of alter-alter ties/dyads in ego-centered networks. The results can be returned as a wide or long tibble/data.frame.

**Usage**

```r
count_dyads(
  object,
  alter_var_name,
  return_as = c("wide", "long"),
  prefix = NULL
)
```

**Arguments**

- **object**
  - An egor object.
- **alter_var_name**
  - Character, naming the alter variable to use as attribute.
- **return_as**
  - Character, either "wide" (default) or "long".
- **prefix**
  - Character, added in front of variables. Only used if `return_as` is "wide". If NULL (default) prefix is automatically generated.

**Value**

Wide or long tibble/data.frame.

**Examples**

```r
data(egor32)
count_dyads(object = egor32,
  alter_var_name = "country")

# Return result as long tibble.
count_dyads(object = egor32,
  alter_var_name = "country",
  return_as = "long")
```
egor32  

32 randomly created ego-centered networks stored as an egor object

Description

32 randomly created ego-centered networks stored as an egor object

Usage

egor32

Format

An egor object with 32 ego-centered networks (5 variables):

- **egoID**: ego identifier
- **sex**: ego’s gender
- **age**: ego’s age
- **.alts**: nested column-list containing alters
- **.aaties**: nested column-list containing alter-alter relations

egor_options  

Display names and values of global egor options.

Description

Display names and values of global egor options.

Usage

egor_options()

Details

Currently egor makes use of the following global options. Use options() to change values.

- **egor.print.rows.active.level**:
  - Numeric. Amount of rows to display when printing the active level of an egor object.

- **egor.print.rows.inactive.level**:
  - Numeric. Amount of rows to display when printing the inactive levels of an egor object.

- **egor.print.switch.active.level.to.top**:
  - Logical. When printing an egor object, should the active data-level always be printed first?

- **egor.return.results.with.design**:
  - Logical. egor functions that return ego-level results (e.g. one value per ego) return a `svy_tbl` object containing the `ego_design()`, when this is set to TRUE.
Description
Launces an interactive Shiny Web App that creates a list of igraph objects from an ‘egor’ object and offers the user several graphical means of interacting with the visualization parameters for all networks in the egor object.

Usage

```r
egor_vis_app(object = NULL, shiny_opts = list(launch.browser = TRUE))
```

Arguments

- **object**: An egor object.
- **shiny_opts**: A list of arguments to be passed to `shiny::shinyApp()`’s options argument.

Note
This function requires `shiny` to be installed.

Examples

```r
# if(interactive()){  
#   data("egor32")  
#   egor_vis_app(egor32)  
#}
```

description
32 randomly created egos belonging to ego-centered networks

Usage

```r
egos32
```
ego_constraint

Format

A data frame with 32 sets of alter-alter relations and 4 variables:

- **.EGOID**: ego identifier
- **age**: age in categories
- **age.years**: age in years
- **country**: country
- **income**: income
- **sex**: gender

Description

This calculates Burt’s *network constraint* for all egos in an ego object. It iterates over each network and applies `igraph::constraint`. A weight variable can be specified.

Usage

```r
ego_constraint(object, weights = NULL, ego.alter.weights = weights)
```

Arguments

- **object**: An ego object.
- **weights**: Character, naming the alter-alter tie weight variable.
- **ego.alter.weights**: Character, naming the ego-alter weight tie weight variable. This defaults to the same value as `weights`, only specify if the name of the `ego.alter.weights` is different from `weights`.

Details

The calculation of weighted network constraint only works, if the alter-alter tie weights are complemented by a alter level variable specifying the same weight for the ego-alter ties.

Value

Numeric vector with a constraint value for each ego.

References

Examples

```r
data(egor32)
ego_constraint(egor32)
```
**ego_density**

*Calculate the relationship density in ego-centered networks*

**Description**

This function uses an `egor` object and calculates the density of all the ego-centered networks listed in the `egor` object. Instead of an `egor` object, alter and alter-alter data can be provided as lists or data.frames.

**Usage**

```r
ego_density(object, ...)## S3 method for class 'egor'
egeo_density(object, weight = NULL, max.netsize = NULL, directed = FALSE, ...)
```

**Arguments**

- `object`: An `egor` object.
- `...`: arguments to be passed to methods
- `weight`: Character naming a variable containing the weight values of relations. Weights should range from 0 to 1.
- `max.netsize`: Optional parameter. Constant value used if the number of alters whose relations were collected is limited.
- `directed`: logical indicating if the alter-alter relation data/edges are directed or un-directed.

**Value**

returns a vector of network density values.

**Examples**

```r
data("egor32")
egeo_density(egor32)
```

---

**ego_design**

*Set and query the ego sampling design*

**Description**

Extract, set, remove, or update the survey design associated with an ego-centered dataset.
Usage

ego_design(x, ...)

## S3 method for class 'egor'
ego_design(x, ...)

## S3 method for class 'nested_egor'
ego_design(x, ...)

ego_design(x, ...) <- value

## S3 replacement method for class 'egor'
ego_design(x, ...) <- value

## S3 replacement method for class 'nested_egor'
ego_design(x, ...) <- value

has_ego_design(x)

## S3 method for class 'egor'
has_ego_design(x)

## S3 method for class 'nested_egor'
has_ego_design(x)

strip_ego_design(x)

Arguments

x  an egor object.
...
arguments to be passed to methods
value a list of arguments to srvyr::as_survey_design() specifying the sampling design for the egos. If the arguments are formulas, they can refer to columns (ego attributes) of x. NULL clears design information.

Note

This can be useful for adjusting or re-initializing the ego design information after the underlying ego attributes had been modified.

EI

Calculate EI-Index of ego networks
Description

The EI-Index is the division of the surplus count intra-group edges over inter-group edges, divided by total count of all edges. This implementation uses the intra-group and inter-group density instead of edge counts, when `rescale` is set to `TRUE` (default). The EI-Index is calculated for the whole network and for subgroups. Alternatively, the EI index can be employed as a measurement for egos tendency to homo-/heterophily - use `comp_ei()` for that variant of the EI-Index.

Usage

```r
EI(object, alt.attr, include.ego = FALSE, ego.attr = alt.attr, rescale = TRUE)
```

Arguments

- **object**: An ego object.
- **alt.attr**: Character naming grouping variable.
- **include.ego**: Logical. Include or exclude ego from EI calculation.
- **ego.attr**: Character, naming the ego variable corresponding to `ego.attr`. Defaults to `ego.attr`.
- **rescale**: Logical. If `TRUE`, the EI index calculation is re-scaled, so that the EI is not distorted by differing group sizes.

Details

The whole network EI is a metric indicating the tendency of a network to be clustered by the categories of a given factor variable (`alt.attr`). The EI value of a group describes the tendency of that group within a network to be connected (if between 0 and 1) or not connected (if between -1 and 0) to other groups. Differing group sizes can lead to a distortion of EI values i.e. the ability of a big group A to form relationships to much smaller group B is limited by the size of B. Even when all possible edges between A and B exist, the EI value for group A might still be negative, classifying it as homophile. The re-scaled EI-Index values provided by this implementation substitutes absolute edge counts by inter- and intra-group edge densities in order to avoid the distortion of the EI-Index values. These values express the extend of homo- or heterophily of the network and its subgroups, as made possible by subgroup sizes.

Value

Returns tibble with the following columns:

- ego ID (".egoID")
- network EI-Index ("ei")
- subgroup EI-Index values (named by value levels of `alt.attr`/`ego.attr`)

References

See Also

comp_ei(), for an ego level homophily measure.

Examples

data("egor32")
EI(egor32, "sex")

extract_egos_and_return

This extracts egos from igraph/network data if they are named in ego_name and returns an egor object

Description

This extracts egos from igraph/network data if they are named in ego_name and returns an egor object

Usage

extract_egos_and_return(graph_attrs, alters, edges, ego_name = NULL)

Arguments

graph_attrs List of graph attributes
alters alters
edges edges
tego_name ego_name

gss2004

A selective subset of GSS 2004 data

Description

This is a selective subset of General Social Survey 2004 data containing variables from network questions. See Details for description how this particular subset was selected. The data has a near 0 research value, it is provided to illustrate the functions in egor package.

Usage

gss2004
Format

A tibble with 499 rows and the variables listed below. Data was imported from SPSS file and are labelled. Functions in the `labelled` package can be used to handle them.

Variables:

- **id**: Case ID
- **vpsu, vstrat, wtssall**: Design variables and weight
- **age**: Ego’s age in years
- **race**: Ego’s race. 1=white, 2=black, 3=other
- **sex**: Ego’s sex. 1=male, 2=female
- **marital**: Ego’s marital status. 1=married, 2=widowed, 3=divorced, 4=separated, 5=never married
- **numgiven**: Number of alters mentioned
- **age[1-5]**: Alter’s age in years
- **race[1-5]**: Alter’s race. 1=asian, 2=black, 3=hispanic, 4=white, 5=other
- **sex[1-5]**: Alter’s sex. 1=male, 2=female
- **spouse[1-5]**: Whether alter is a spouse of ego. 1=mentioned, 2=not mentioned
- **close[1-4 [2-5]]**: How close are the two alters according to ego. 1=especially close, 2=know each other, 3=total strangers

Details

This dataset was created from original GSS 2004 data for illustrative purposes such that (1) it is small and (2) contains just enough variation in respondent’s personal networks to illustrate various functions in the package. It is essentially a stratified sample from original data (1472 cases). Strata correspond to groups of cases created from unique combinations of values on the following ego variables: age (3 categories), race, sex, marital, numgiven. At most 2 cases were sampled from each stratum via simple random sampling with replacement.

Source

General Social Survey data at NORC: [https://gss.norc.org/get-the-data](https://gss.norc.org/get-the-data)

**helper**

General helper functions

**Description**

Helper functions for ego centered network analysis
Usage

```r
as_nested_egor(x)
alters_by_ego(x)
## S3 method for class 'egor'
alters_by_ego(x)
## S3 method for class 'nested_egor'
alters_by_ego(x)
aaties_by_ego(x)
## S3 method for class 'egor'
aaties_by_ego(x)
## S3 method for class 'nested_egor'
aaties_by_ego(x)
dyad.poss(max.alters, directed = FALSE)
sanitize.wide.edges(max.alters)
create_edge_names_wide(x)
dyads_possible_between_groups(x, y, geometric = TRUE)
din_page_dist(x)
```

Arguments

- `x` (Numeric)
- `max.alters` (A numeric giving the maximum number of alters)
- `directed` (A logical value indicating directedness of alter-alter data)
- `y` (Numeric)
- `geometric` (Logical. Calculate possible dyads for geometric mean?)

Functions

- `as_nested_egor()`: Converts an egor object to a "legacy" egor object with nested .alts and .aaties columns.
- `alters_by_ego()`: Splits the alter table into a list of tables (possibly 0-row) of alters associated with each ego, in the same order as the ego table.
- `aaties_by_ego()`: Splits the alter–alter ties table into a list of tables (possibly 0-row) of alter–alter associated with each ego, in the same order as the ego table.
- `dyad.poss()`: Returns the count of possible edges in an un-directed or directed, ego-centered network, based on the number of alters.
- sanitize_wide_edges(): Generates a data.frame marking possible dyads in a wide alter-alter relation data.frame. Row names corresponds to the network size. This is useful for sanitizing alter-alter relations in the wide format.
- create_edge_names_wide(): Creates a vector of names for variables containing data on alter-alter relations/dyads in ego-centered networks.
- dyads_possible_between_groups(): Calculates the possible edges between members of different groups in an ego-centered network.
- din_page_dist(): Calculates the optimal distribution of a number of equally sized objects on a DIN-Norm DIN 476 (i.e. DIN A4) page in landscape view.

---

**layout_egogram**: Create layout for an egogram

**Description**

This creates pairs of x and y coordinates for a egogram, accompanied by alter IDs for each coordinate pair.

**Usage**

```r
layout_egogram(altID, venn_var, pie_var)
```

**Arguments**

- `altID`: Vector of alter IDs.
- `venn_var`: Vector of values representing alter groups corresponding with venns in an egogram.
- `pie_var`: Vector of values representing alter groups corresponding with pieces of pie in an egogram.

**Value**

A dataframe with three columns: x, y and altID.

---

**make_egor**: Generate random ego-centered-network data.

**Description**

This function generates random ego-centered-network data for a specified number of networks with a maximum network size. The network size of the generated networks is a normal distribution with sd=5.

**Usage**

```r
make_egor(net.count, max.alters, netsize_fixed = FALSE, plot = FALSE)
```
onefile_to_egor

Arguments

net.count Number of networks/ egos to generate.
max.alters Maximum size of networks.
netsize_fixed Logical, if TRUE all networks will have max.alters as network size.
plot whether to plot the network size distribution.

Arguments

egos Data frame containing ego data (egos as cases)
netsize Numeric, network size values are used to filter out empty alter entries. If the alter data is not structured in a way, where valid alters are stored before the invalid alters, pass NULL here and filter out invalid alters afterwards.
ID.vars Character. For onefile_to_egor only the name of the ego ID needs to be provided.
attr.start.col Index or name of the first column containing alter attributes.
attr.end.col Index or name of the last column containing alter attributes.
max.alters Maximum number of alters.
aa.first.var First column containing alter-alter relations/ edges.
aa.regex A Perl regular expression with name capture, intended to be run on column names and capturing via named capture the following regex groups: "attr", "src", and "tgt", representing the edge attribute being captured, the source (or the first alter identified), and the target (or the second alter identified) of the edge, respectively. See regex for more information.

Description

This function imports ego-centered network data, stored in a single file, providing ego, alter and edge data. This data format is used by the Allbus 2010 (GESIS) and similar social surveys.

Usage

onefile_to_egor(
  egos,
  netsize = NULL,
  ID.vars = list(ego = "egoID"),
  attr.start.col,
  attr.end.col,
  max.alters,
  aa.first.var,
  aa.regex = NULL,
  var.wise = FALSE,
  ...)

Arguments

egos Data frame containing ego data (egos as cases)
netsize Numeric, network size values are used to filter out empty alter entries. If the alter data is not structured in a way, where valid alters are stored before the invalid alters, pass NULL here and filter out invalid alters afterwards.
ID.vars Character. For onefile_to_egor only the name of the ego ID needs to be provided.
attr.start.col Index or name of the first column containing alter attributes.
attr.end.col Index or name of the last column containing alter attributes.
max.alters Maximum number of alters.
aa.first.var First column containing alter-alter relations/ edges.
aa.regex A Perl regular expression with name capture, intended to be run on column names and capturing via named capture the following regex groups: "attr", "src", and "tgt", representing the edge attribute being captured, the source (or the first alter identified), and the target (or the second alter identified) of the edge, respectively. See regex for more information.
plot_egograms

var.wise Logical value indicating if the alter attributes are sorted variable wise (defaults to FALSE).

... additional arguments to egor().

Value

An egor object is returned. It is a list of three data frames: (1) ego: dataframe of all egos and their attributes; (2) alter: dataframe of all alters; (3) aatie: dataframe of alter alter ties/ edges

References

Examples

path_to_one_file_8 <- system.file("extdata", "one_file_8.csv", package = "egor")
egos_8 <- read.csv2(path_to_one_file_8)

onefile_to_egor(
egos = egos_8, netsize = egos_8$netsize,
attr.start.col = "alter.sex.1",
attr.end.col = "alter.age.8",
aa.first.var = "X1.to.2",
max.alters = 8)

Description

egor objects can be plotted as egographs or egograms. By default networks of the four first egos are plotted.

Usage

plot_egograms(
x,
ego_no = 1,
x_dim = 1,
y_dim = 1,
venn_var = NULL,
pie_var = NULL,
ascending_inwards = TRUE,

plot_egograms

```r

  type = c("egograph", "egogram")
"

## S3 method for class 'egor'
plot(x, ...)

Arguments

  x  An egor object.
  ego_no  Ego row number.
  x_dim  Number of ego networks to plot horizontally.
  y_dim  Number of ego networks to plot vertically
  venn_var  Name (character) of alter column.
  pie_var  Name (character) of alter column.
  ascending_inwards  Logical determining the venn circle order. If TRUE (default) values ascend from the outside to the inside, if FALSE the reverse.
  vertex_size_var  Name (character) of alter column.
  vertex_color_var  Name (character) of alter column.
  vertex_color_palette  Name (character) of color palette, see details for available color palettes.
  vertex_color_legend_label  Character.
  vertex_label_var  Name (character) of alter column. Set this to NULL to suppress labels.
  edge_width_var  Name (character) of alter column.
  edge_color_var  Name (character) of alter column.
  edge_color_palette  Name (character) of color palette, see details for available color palettes.
  highlight_box_col_var  Name (character) of ego column.
  highlight_box_col_palette  Name (character) of color palette, see details for available color palettes.
  res_disp_vars  Name (character) of ego column.
  vertex_zoom  Numeric.
  edge_zoom  Numeric.
  font_size  Numeric.
  pie_colors  Character vector of colors to be used for coloring the subsections of the circle.
  venn_gradient_reverse  Logical, set to TRUE in order to have the color intensity of venns increase going from the inner circles to the outer circles.
show_venn_labels Logical.

include_ego Logical.

Additional arguments forwarded to plot.igraph.

ego_alter_edge_width_var
   Name (character) of alter column.

ego_alter_edge_color_var
   Name (character) of alter column.

type Character. Either "egograph" or "egogram".

Details

For type equals "egograph" ego networks are plotted with igraph’s plotting engine. "egogram" uses a special layout that places the nodes on a map of (1) concentric circles with (2) subsections, that can be mapped to alter variables.

Available color palettes are:

- Heat Colors
- Yellow-Green
- Red-Yellow
- Blue-Red
- Black-White
- Greys
- Rainbow
- Topo Colors

Functions

- plot_egograms(): Plots an ego-socio-gram.
- plot_ego_graphs(): Plots an ego graph.

Examples

```r
e <- make_egor(net.count = 5, max.alters = 12)
plot_egograms(x = e,
   ego_no = 2,
   venn_var = "sex",
   pie_var = "country",
   vertex_size_var = "age")

plot(e)
```
**Description**

This function imports ego-centered network data from folders with separate files for alters-level and edge data. It will run some basic checks upon the completeness of the data and inform the user of potential problems. This function can be used to import data exported from EgoNet (McCarty 2011).

**Usage**

```r
read_egonet(
  egos.file, alter.folder, edge.folder, csv.sep = ",", 
  ID.vars = list(ego = "egoID", alter = "alterID", source = "Source", target = "Target"), 
  first.col.row.names = FALSE, ...
)
```

**Arguments**

- **egos.file**: File name of the .csv file containing the ego data.
- **alter.folder**: Folder name of the folder containing the alter data in separate .csv files for each ego/ network.
- **edge.folder**: Folder name of the folder containing the edge/ tie data in separate .csv files for each ego/ network.
- **csv.sep**: Character indicating the separator used in csv files.
- **ID.vars**: A named list containing column names of the relevant input columns:
  - **ego**: unique identifier associated with each ego, defaulting to "egoID"; has no effect if alters.df and aties.df are both lists of data frames.
  - **alter**: unique-within-ego identifier associated with each alter, defaulting to "alterID"; optional aties.df are not provided.
  - **source**: if aties.df is provided, the column given the alter identifier of the origin of a relation.
  - **target**: if aties.df is provided, the column given the alter identifier of the destination of a relation.
- **first.col.row.names**: Boolean indicating if first column contains row names, that are to be skipped, default is FALSE.
- **...**: additional arguments to `egor()`.
Value

An **egor** object is returned. It is a list of three data frames: (1) ego: dataframe of all egos and their attributes; (2) alter: dataframe of all alters; (3) aatie: dataframe of alter alter ties/edges

Examples

```r
egos.file <- system.file("extdata", "egos_32.csv", package = "egor")
alters.folder <- system.file("extdata", "alters_32", package = "egor")
edge.folder <- system.file("extdata", "edges_32", package = "egor")

ef <- read_egonet(egos.file = egos.file,
  alter.folder = alters.folder,
  edge.folder = edge.folder,
  csv.sep = ";")
```

---

**return_results**  
*Returns results inheriting srvyr design if the input egor object has a an ego_design and global option "egor.return.results.with.design" is TRUE or 'NULL'.*

---

Description

Returns results inheriting srvyr design if the input egor object has a an ego_design and global option "egor.return.results.with.design" is TRUE or 'NULL'.

Usage

```r
return_results(x, results)
```

Arguments

- **x**  
  Original egor object, as submitted in call to parent function.
- **results**  
  data.frame with .egoID column and a column that hold the ego-level results.

---

**rowlist**  
*Convert a table to a list of rows*

---

Description

A convenience function converting a data.frame() or a tibble().

Usage

```r
rowlist(x)
```
Arguments

x a data.frame(), a tibble(), or some other table data structure backed by a list() of columns.

Value

A list() of length nrow(x), with each element itself a named list() containing the elements in the corresponding row.

Examples

library(tibble)
(df <- tibble(x=2:1, y=list(list(1:3), list(3:4))))
rowlist(df)
**Alter-alter indices** .srcRow and .tgtRow contain the index (counting from 1) of the row of the alter being referenced by .srcID and .tgtID. (This can be used to quickly access the attributes of the alters in question.)

... extra arguments to subset if subset is a function; otherwise unused.

**unit** a selector of the unit of analysis being affected: the egos, the alters or the (alter-alter) ties. Note that only one type of unit can be affected at a time. Defaults to the current active unit selected by activate.egor().

**i** numeric or logical vector indexing the appropriate unit.

**j** either an integer vector specifying which columns of the filtered structure (ego, alters, or ties) to select, or a logical vector specifying which columns to keep. Note that the special columns .egoID, .altID, .srcID, .tgtID are not indexed by j.

### Details
Removing or duplicating an ego will also remove or duplicate their alters and ties.

### Value
An egor() object.

### Examples

```r
# Generate a small sample dataset
(e <- make_egor(5,4))

# First three egos in the dataset
e[1:3,]

# Using an external vector
# (though normally, we would use e [.keep,] here)
.keep <- rep(c(TRUE, FALSE), length.out=nrow(e$ego))
subset(e, .keep)

# Filter egos
subset(x = egor32, subset = egor32$ego$variables$sex == "m", unit="ego")
subset(x = egor32, sex == "m")

# Filter alters
subset(x = egor32, sex == "m", unit = "alter")

# Filter aaties
subset(x = egor32, weight != 0, unit = "aatie")

# Filter egos by alter variables (keep only egos that have more than 13 alters)
subset(x = egor32, nrow(alter) > 13, unit = "alter")

# Filter alters by ego variables (keep only alters that have egos from Poland)
subset(x = egor32, ego$country == "Poland", unit = "ego")
```
summary.egor

# Filter edges by alter variables (keep only edges between alters where 'sex == "m"')
subset(x = egor32, all(alter$sex == "m"), unit = "aatie")

---

**Summary**

Methods to print and summarize `egor` objects

**Usage**

```r
## S3 method for class 'egor'
summary(object, ...)

## S3 method for class 'egor'
print(
  x,
  ..., 
  n.active = getOption("egor.rows_active_level"),
  n.inactive = getOption("egor.rows_inactive_level")
)
```

**Arguments**

- `object, x`: an `egor` object.
- `...`: additional arguments, either unused or passed to lower-level functions.
- `n.active`: `Numeric`. Number of rows to print for active data level.
- `n.inactive`: `Numeric`. Number of rows to print for inactive data levels.
- `n`: Number of rows to print.

**threefiles_to_egor**

Read/ import ego-centered network data from the three files format, EgoWeb2.0 or openeddi.

**Description**

These functions read ego-centered network data from the three files format, EgoWeb2.0 or openeddi and transform it to an egoR object. The three files format consists of an ego file, on alters file and one file containing the edge data. EgoWeb2.0 and openeddi use variations of this format.
Usage

threefiles_to_egor(
  egos,
  alters.df,
  edges,
  ID.vars = list(ego = "egoID", alter = "alterID", source = "Source", target = "Target"),
  ego.vars = NULL,
  ...
)

read_egoweb(
  alter.file,
  edges.file,
  egos.file = NULL,
  ego.vars = NULL,
  ...
)

read_openeddi(
  egos.file = NULL,
  alters.file = NULL,
  edges.file = NULL,
  ID.vars = list(ego = "puid", alter = "nameid", source = "nameid", target = "targetid"),
  ego.vars = NULL,
  ...
)

Arguments

egos             Data frame containing ego data (egos as cases)
alters.df        Data frame containing alters data (alters in rows), alters are connected to their
ego by an egoID.
edges            Dataframe. A global edge list, first column is ego ID variable. egos.
ID.vars          A named list containing column names of the relevant input columns:
                  ego  unique identifier associated with each ego, defaulting to "egoID"; has no
                  effect if alters.df and aaties.df are both lists of data frames.
                  alter unique-within-ego identifier associated with each alter, defaulting to "alterID";
                  optional aaties.df are not provided.
                  source if aaties.df is provided, the column given the alter identifier of the
                  origin of a relation.
                  target if aaties.df is provided, the column given the alter identifier of the
                  destination of a relation.
ego.vars         A data.frame of alter attributes in the wide format.
...               additional arguments to egor().
threefiles_to_egor

alter.file A character specifying the filename of the alters data.
edges.file A character specifying the filename of the edge data.
egos.file A character specifying the filename of the ego data.
alters.file Character name of the alters data file.

Value

An ego object is returned. It is a list of three data frames: (1) ego: dataframe of all egos and their attributes; (2) alter: dataframe of all alters; (3) aatie: dataframe of alter alter ties/edges

Functions

- read_egoweb(): This function reads in data from an EgoWeb 2.0 survey and transforms it to an egoR object. If no file name for the egos file is provided ego data is assumed to be merged with alters data and it will be extracted by read_egoweb. By default the standard ID variable names of EgoWeb are used, if you need to specify the ID variable names use the ID.vars parameter. Further Information: github.com/qualititative/egoweb
- read_openeddi(): This function reads in data created by the openeddi survey software and transforms it to an egoR object. If no parameters are provided read_openeddi will try to find the adequate files in the working directory. By default the standard ID variable names of openeddi are used, if you need to specify the ID variable names use the ID.vars parameter. Further Information: www.openeddi.com

Examples

# The data for read.egonet.threefiles() needs to be loaded with read.csv(), # for it to be converted to an egoR object.
egos.file <- system.file("extdata", "egos_32.csv", package = "egor")
alters.file <- system.file("extdata", "alters_32.csv", package = "egor")
edges.file <- system.file("extdata", "edges_32.csv", package = "egor")

egos <- read.csv2(egos.file)
alters <- read.csv2(alters.file)
edges <- read.csv2(edges.file)

tf <- threefiles_to_egor(egos = egos, alters.df = alters, edges = edges)

# read_egoweb() and read_openeddi() read the files directly from the disk.

# Fetch current working directory
wd <- getwd()

setwd(system.file("extdata", "openeddi", package = "egor"))
oe <- read_openeddi()

setwd(system.file("extdata", "egoweb", package = "egor"))

ew <- read_egoweb(alter.file = "alters_32.csv", edges.file = "edges_32.csv", 
egos.file = "egos_32.csv")

# Restore working directory
transnat

Description

This is an egor object derived from a subset of the data of a personal network study on support relationships German migrants living in the UK maintain. The data was collected in 2010 using respondent driven sampling (snowball sampling). While the number of alters the respondents were allowed to enter was not limited, only a random subsample of up to eight alters were selected for the alter name interpreter and alter-alter tie questions. This data set contains the data for 50 of the originally 234 egos.

Usage

transnat
alter_df
ego_df

Format

transnat: an egor object of 50 egos.
alter_df: alter data.frame of the transnat dataset.
ego_df: ego data.frame of the transnat dataset.

Details

The questionnaire used seven name generators:

1. From time to time, people rely on other people’s advice and opinions to help them find their way in life better. In the last 12 months, who have you sought advice from when it came to important decisions, for example about your family or work? (emotional)
2. In the last 12 months who has done little jobs and favors for you or helped you, for example in filling in forms or moving home? (instrumental)
3. In the past year, who have you turned to when you felt down and wanted someone to talk to? (emotional)
4. In the last 12 months, who have you borrowed money from? (instrumental)
5. In the past year, who have you spent your free time with or shared a hobby? (social companionship)
6. In the past year who have you had disagreements or arguments with (e.g. about everyday affairs, money or property)? (conflict)
7. Who has let you know that you can rely on them (e.g. that they will always be there for you if you need help)? (emotional).
References

trim_aaties

Trims alter-alter ties of alters that are missing/deleted from alters data.

Description

This is used in the background by dplyr methods, to maintain the alter-alter ties according to changes made to the ego and alter data levels.

Usage

trim_aaties(object)

Arguments

object An ego object.

Value

An ego object with trimmed alter-alter ties (.aaties).

trim_alters

Trims alters that are missing/deleted from ego data.

Description

This is used in the background by dplyr methods, to maintain the alter ties according to changes made to the ego data level.

Usage

trim_alters(object)

Arguments

object An ego object.

Value

An ego object with trimmed alter-alter ties (.aaties).
twofiles_to_egor

Import ego-centered network data from two file format

Description

This function imports ego-centered network data, stored in two files, where one file contains the ego attributes and the edge information and the other file contains the alters data. This form of data storage for ego-centered network data is proposed by Muller, Wellman and Marin (1999).

Usage

twofiles_to_egor(
  egos,
  alters,
  ID.vars = list(ego = "egoID", alter = "alterID", source = "Source", target = "Target"),
  max.alters,
  aa.first.var,
  selection = NULL,
  ...
)

Arguments

dataframe

egos Data frame containing ego data (egos as cases)
alters Data frame containing alters data (alters in rows), alters are connected to their ego by an egoID.

ID.vars A named list containing column names of the relevant input columns:
  ego unique identifier associated with each ego, defaulting to "egoID"; has no effect if alters.df and aties.df are both lists of data frames.
  alter unique-within-ego identifier associated with each alter, defaulting to "alterID";
    optional aties.df are not provided.
  source if aties.df is provided, the column given the alter identifier of the origin of a relation.
  target if aties.df is provided, the column given the alter identifier of the destination of a relation.
max.alters Maximum number of alters that are included in edge data.
aa.first.var Index or name of the first column in egos containing alter-alter data.
selection Character naming numeric variable indicating alters selection with zeros and ones.

Value

An egor object is returned. It is a list of three data frames: (1) ego: dataframe of all egos and their attributes; (2) alter: dataframe of all alters; (3) aatie: dataframe of alter alter ties/ edges
Examples

```r
path_to_alters_8.csv <- system.file("extdata", "alters_8.csv", package = "egor")
path_to_one_file_8 <- system.file("extdata", "one_file_8.csv", package = "egor")

# read data from disk
egos_8 <- read.csv2(path_to_one_file_8)
alters_8 <- read.csv2(path_to_alters_8.csv)

# convert to egor object
twofiles_to_egor(
  egos = egos_8,
  alters = alters_8,
  max.alters = 8,
  aa.first.var = "X1.to.2")
```

---

**vis_clustered_graphs**  
*Visualize clustered graphs*

**Description**

*vis_clustered_graphs* visualizes clustered graphs using a list of clustered graphs created with `clustered_graphs`.

**Usage**

```r
vis_clustered_graphs(
  graphs,
  node.size.multiplier = 1,
  node.min.size = 0,
  node.max.size = 200,
  normalise.node.sizes = TRUE,
  edge.width.multiplier = 1,
  center = 1,
  label.size = 0.8,
  labels = FALSE,
  legend.node.size = 45,
  pdf.name = NULL,
  ...
)
```

**Arguments**

- `graphs`: List of graph objects, representing the clustered graphs.
- `node.size.multiplier`: Numeric used to multiply the node diameter of visualized nodes.
- `node.min.size`: Numeric indicating minimum size of plotted nodes.
- `node.max.size`: Numeric indicating maximum size of plotted nodes.
normalise.node.sizes
Logical. If TRUE (default) node sizes are plotted using per network proportions rather than counts.

edge.width.multiplier
Numeric used to multiply the edge width.

center
Numeric indicating the vertex to be plotted in center.

label.size
Numeric.

lables
Boolean. Plots with turned off labels will be accompanied by a 'legend' plot giving the labels of the vertices.

legend.node.size
Numeric used as node diameter of legend graph.

pdf.name
Character giving the name/path of the pdf file to create.

... Arguments to pass to plot.igraph.

Value

vis_clustered_graphs plots a list of igraph objects created by the clustered_graphs function.

clustered_graphs returns a list of graph objects representing the clustered ego-centered network data;

clustered_graphs for creating clustered graphs objects

Examples

data("egor32")

# Simplify networks to clustered graphs, stored as igraph objects
graphs <- clustered_graphs(egor32, "country")

# Visualise
par(mfrow = c(2,3))
vis_clustered_graphs(
  graphs[1:5]
)
par(mfrow = c(1,1))
weights.egor

weights.egor() extracts the (relative) sampling weights of each ego in the dataset.

Description

weights.egor() extracts the (relative) sampling weights of each ego in the dataset.

Usage

## S3 method for class 'egor'
weights(object, ...)  

Arguments

object an egor object.
... arguments to be passed to methods
