Package ‘eia’

April 15, 2024

**Title**  API Wrapper for U.S. Energy Information Administration (‘EIA’)

**Open Data**

**Version** 0.4.2

**Description**

This package includes functions for searching the EIA data directory and returning time series and geoset time series datasets. Datasets returned by these functions are provided by default in a tidy format, or alternatively, in more raw formats.

It also offers helper functions for working with EIA date strings and time formats and for inspecting different summaries of series metadata.

The package also provides control over API key storage and caching of API request results.

**License** MIT + file LICENSE

**URL**  https://docs.ropensci.org/eia/, https://github.com/ropensci/eia

**BugReports**  https://github.com/ropensci/eia/issues

**Imports**  tibble, httr, jsonlite, memoise, lubridate

**Suggests**  testthat (>= 3.0.0), knitr, covr, rmarkdown, dplyr, tidyr, ggplot2, spelling

**VignetteBuilder**  knitr

**Config/testthat/edition**  3

**Encoding**  UTF-8

**Language**  en-US

**RoxygenNote**  7.3.1

**NeedsCompilation**  no

---

### Description

This package provides API access to data from the US Energy Information Administration (EIA).

### eiadate

**EIA date parsing**

**Description**

Helper functions for manipulating and converting between regular year-month-day date strings and EIA date string notation.
Usage

eiadate_to_date(x)

date_to_eiadate(x, date_format = c("A", "Q", "M", "W", "D", "H"))

eiadate_to_date_seq(start, end, weekly = FALSE)

Arguments

x character, EIA date string; character or date object for regular dates. See details.
date_format EIA date format: "A", "Q", "M", "W", "D", "H". These stand for annual, quarterly, monthly, weekly, daily, hourly. See details.
start start EIA date or date.
end end EIA date or date.
weekly logical. See details.

Details

There is no reason to mix EIA date formats in this context. Functions that take EIA date strings expect a consistent format. Also, EIA date formats are parsed automatically from the dates themselves. However, daily and weekly use the same format. Too avoid ambiguity in eia_date_seq(), daily is assumed; set weekly = TRUE to treat as weekly.

When providing a real date or date string, such as to date_to_eiadate(), dates should be in YYYY-MM-DD format, or at least any format that can be parsed by lubridate::ymd or lubridate::ymd_hms for dates and hourly date times, respectively.

"LH" is not a supported date format. Use "H". The API does not translate the date and time when using "LH" anyhow; it simply appends the date string with the number of hours time difference.

Examples

eiadate_to_date(c("2018-03", "2018-04"))

date_to_eiadate("2018-05-14", "A")
date_to_eiadate("2018-05-14", "Q")
date_to_eiadate("2018-05-14", "M")

(x <- eiadate_to_date_seq("2018-Q1", "2018-Q4"))
date_to_eiadate(x, "Q")
date_to_eiadate(x, "M")

(x <- eiadate_to_date("2019-01-02T16Z"))
date_to_eiadate(x, "H")
(x <- eiadate_to_date_seq("2019-01-02T16Z", "2019-01-02T19Z"))
date_to_eiadate(x, "H")
### eia_clear_cache

*Clear API results cache*

#### Description

Reset the results of API calls that are currently cached in memory.

#### Usage

```r
eia_clear_cache()
eia_clear_dir()
eia_clear_metadata()
eia_clear_data()
eia_clear_facets()
```

#### Details

eia_clear_cache() clears the entire cache. The other functions clear the cache associated with specific endpoints.

#### Examples

```r
## Not run:
key <- Sys.getenv("EIA_KEY") # your stored API key
system.time(eia_dir(key))
system.time(eia_dir(key))
eia_clear_cache()
system.time(eia_dir(key))
## End(Not run)
```

### eia_data

*EIA data*

#### Description

Obtain data from the EIA.
Usage

eia_data(
  dir,
  data = NULL,
  facets = NULL,
  freq = NULL,
  start = NULL,
  end = NULL,
  sort = NULL,
  length = NULL,
  offset = NULL,
  tidy = TRUE,
  check_metadata = FALSE,
  cache = TRUE,
  key = eia_get_key()
)

Arguments

dir character, directory path.
data character or NULL,
  • note: if NULL, eia_data() will only return column headings; must input a
    character value as provided by eia_metadata() for data to be returned.
  • see details.
facets character list or NULL, see details.
freq character or NULL, see details.
start, end character or NULL, see details.
sort named list of two.
  • cols: list column names on which to sort.
  • order: "asc" or "desc" for ascending or descending, respectively.
length numeric or NULL, number of rows to return.
offset numeric or NULL, number of rows to skip before return.
tidy logical or NULL, return a tidier result. See details.
check_metadata logical, if TRUE checks input values against metadata endpoint.
cache logical, cache result for duration of R session using memoization. See details.
key API key: character if set explicitly; not needed if key is set globally. See eia_set_key().

Details

By default, data, facets, and freq are set to NULL. To obtain valid input values for each of these arguments, use the specific ID labels as provided by eia_metadata().

The use of start and end require some input to freq. By default (check_metadata = FALSE), the resulting data will match the temporal resolution provided to freq, however, check_metadata =
TRUE applies further restrictions such that the format of values provided to start/end must match that of freq. Furthermore, regardless of the input format provided to start/end, the resulting data will always match the specification of freq. And lastly, regardless of chosen format, end must be strictly greater than start to return data.

By default, additional processing is done to return a list containing tibble data frames. Set tidy = FALSE to return only the initial list result of jsonlite::fromJSON. Set tidy = NA to return the original JSON as a character string.

Set to cache = FALSE to force a new API call for updated data. Using FALSE always makes a new API call and returns the result from the server. TRUE uses memoization on a per R session basis, caching the result of the function call in memory for the duration of the R session. You can reset the entire cache by calling eia_clear_cache().

Value

data frame

Examples

## Not run:
eia_data(
  dir = "electricity/retail-sales",
  data = "price",
  facets = list(sectorid = c("COM", "RES"), stateid = "OH")
)
## End(Not run)

---

**eia_dir**  
**EIA directory**

Description

Obtain EIA directory listing.

Usage

eia_dir(dir = NULL, tidy = TRUE, cache = TRUE, key = eia_get_key())

Arguments

dir  character, directory path, if NULL then the API root directory.
tidy logical, return a tidier result. See details.
cache logical, cache result for duration of R session using memoization. See details.
key  API key: character if set explicitly; not needed if key is set globally. See eia_set_key().
Details

By default, additional processing is done to return a list containing tibble data frames. Set tidy = FALSE to return only the initial list result of `jsonlite::fromJSON()`. Set tidy = NA to return the original JSON as a character string.

Set to cache = FALSE to force a new API call for updated data. Using FALSE always makes a new API call and returns the result from the server. TRUE uses memoization on a per R session basis, caching the result of the function call in memory for the duration of the R session. You can reset the entire cache by calling `eia_clear_cache()`.

Value

data frame, list, or character; see details.

Examples

```r
## Not run:
# use eia_set_key() to store API key
eia_dir()
eia_dir("electricity")
eia_dir("electricity/rto")

## End(Not run)
```

**eia_facets**

**EIA facets**

Description

Obtain facets for a given set of EIA data.

Usage

```r
eia_facets(dir, facet, tidy = TRUE, cache = TRUE, key = eia_get_key())
```

Arguments

- **dir** character, directory path.
- **facet** character
- **tidy** logical, return a tidier result. See details.
- **cache** logical, cache result for duration of R session using memoization. See details.
- **key** API key: character if set explicitly; not needed if key is set globally. See `eia_set_key()`.
Details

By default, additional processing is done to return a list containing tibble data frames. Set tidy = FALSE to return only the initial list result of jsonlite::fromJSON(). Set tidy = NA to return the original JSON as a character string.

Set to cache = FALSE to force a new API call for updated data. Using FALSE always makes a new API call and returns the result from the server. TRUE uses memoization on a per R session basis, caching the result of the function call in memory for the duration of the R session. You can reset the entire cache by calling eia_clear_cache().

Value

data frame, list, or character; see details.

Examples

## Not run:
eia_facets("electricity/retail-sales", facet = "sectorid")
## End(Not run)

eia_key

Set and get API key

Description

Set and get API key

Usage

eia_set_key(key, store = c("env", "options", "sysenv"))

eia_get_key(store = c("env", "options", "sysenv"))

Arguments

key character, API key.
store character, method for storing API key. See details.

Details

Setter and getter helpers allow you to store your EIA API key in one of three ways. Their use is optional. You can always pass the API key string to the key argument of any package function that requires it, but you do not have to.

By default the key argument for these functions is key = eia_get_key(). If your key has been stored in a manner that can be retrieved, then you can call all the package API functions without having to provide the key argument repeatedly.
**Value**

`eia_get_key()` returns the key string or NULL with a warning. `eia_set_key()` returns a success message or an error.

**Key storage methods**

If you have already set your key globally somewhere using `eia_set_key()`, `eia_get_key()` will retrieve it. You can add the `EIA_KEY = "yourkey"` key-value pair to `options()` or as a system environment variable yourself and `eia_get_key()` will pick it up as long as you use the name `EIA_KEY`. For convenience you can do this in your R session with `eia_set_key()`. It gives you three options for how to store the key. The default is to use the eia package environment that is created when the package is loaded.

**Precedence**

Choose one method when setting a key. When getting the key, the three locations are checked in the order: package environment, `options()`, then the system environment. To override the order, specify the method explicitly and the check will only occur there. This also makes it possible to override a system level key by working with one stored in the package environment or `options()`.

**Persistence**

Note that none of these three storage methods, including "sysenv" are persistent; the stored key is lost when the R session is terminated. A key that is stored outside of R as a system environment variable is retrievable with `eia_get_key()`, just like those set in an R session with `eia_set_key()` and `store = "sysenv"`. However, if you truly want the key to persist as an environment variable when R terminates, you must manually add it somewhere like `.Renviron`; `Sys.setenv` in R cannot achieve this.

**Examples**

```r
eia_set_key("fake")
eia_get_key()
# eia_get_key("options") # 'NULL' with warning if not set where specified
```

---

**eia_metadata**

**EIA metadata**

**Description**

Obtain EIA data metadata

**Usage**

```r
eia_metadata(dir, tidy = TRUE, cache = TRUE, key = eia_get_key())
```
Arguments

- **dir**: character, directory path.
- **tidy**: logical, return a tidier result. See details.
- **cache**: logical, cache result for duration of R session using memoization. See details.
- **key**: API key: character if set explicitly; not needed if key is set globally. See eia_set_key().

Details

By default, additional processing is done to return a list containing tibble data frames. Set `tidy = FALSE` to return only the initial list result of `jsonlite::fromJSON()`. Set `tidy = NA` to return the original JSON as a character string.

Set to `cache = FALSE` to force a new API call for updated data. Using `FALSE` always makes a new API call and returns the result from the server. `TRUE` uses memoization on a per R session basis, caching the result of the function call in memory for the duration of the R session. You can reset the entire cache by calling `eia_clear_cache()`.

Value

amed list or character; see details.

Examples

```r
## Not run:
eia_dir("electricity/retail-sales")
eia_metadata("electricity/retail-sales")

## End(Not run)
```
