Package ‘getopt’

March 22, 2019

Type Package
Title C-Like 'getopt' Behavior
Version 1.20.3
URL https://github.com/trevorld/r-getopt
Imports stats
BugReports https://github.com/trevorld/r-getopt/issues
Description Package designed to be used with Rscript to write
``#!'' shebang scripts that accept short and long flags/options.
Many users will prefer using instead the packages optparse or argparse
which add extra features like automatically generated help option and usage,
support for default values, positional argument support, etc.
License GPL (>= 2)
Suggests covr, testthat
RoxygenNote 6.1.1
NeedsCompilation no
Author Trevor L Davis [aut, cre],

getopt

C-like getopt behavior

Description

g getopt is primarily intended to be used with “Rscript”. It facilitates writing “#!” shebang scripts that accept short and long flags/options. It can also be used from “R” directly, but is probably less useful in this context.

Usage

getopt(spec = NULL, opt = NULL, command = get_Rscript_filename(), usage = FALSE, debug = FALSE)

Arguments

spec The getopt specification, or spec of what options are considered valid. The specification must be either a 4-5 column matrix, or a character vector coercible into a 4 column matrix using matrix(x,ncol=4,byrow=TRUE) command. The matrix/vector contains:

Column 1: the long flag name. A multi-character string.
Column 3: Argument mask of the flag. An integer. Possible values: 0=no argument, 1=required argument, 2=optional argument.
Column 4: Data type to which the flag’s argument shall be cast using storage.mode. A multi-character string. This only considered for same-row Column 3 values of 1,2. Possible values: logical, integer, double, complex, character. If numeric is encountered then it will be converted to double.
Column 5 (optional): A brief description of the purpose of the option.
The terms option, flag, long flag, short flag, and argument have very specific meanings in the context of this document. Read the “Description” section for definitions.

opt This defaults to the return value of commandArgs(TRUE) unless argv is in the global environment in which case it uses that instead (this is for compatibility with littler).

If R was invoked directly via the “R” command, this corresponds to all arguments passed to R after the “–args” flag.

If R was invoked via the “Rscript” command, this corresponds to all arguments after the name of the R script file.

Read about commandArgs and Rscript to learn more.

command The string to use in the usage message as the name of the script. See argument usage.

usage If TRUE, argument opt will be ignored and a usage statement (character string) will be generated and returned from spec.

dbg This is used internally to debug the getopt() function itself.
Details

gopt() returns a list data structure containing names of the flags that were present in the character vector passed in under the opt argument. Each value of the list is coerced to the data type specified according to the value of the spec argument. See below for details.

Notes on naming convention:

1. An option is one of the shell-split input strings.
2. A flag is a type of option. a flag can be defined as having no argument (defined below), a required argument, or an optional argument.
3. An argument is a type of option, and is the value associated with a flag.
4. A long flag is a type of flag, and begins with the string “–”. If the long flag has an associated argument, it may be delimited from the long flag by either a trailing =, or may be the subsequent option.
5. A short flag is a type of flag, and begins with the string “-”. If a short flag has an associated argument, it is the subsequent option. short flags may be bundled together, sharing a single leading “-”, but only the final short flag is able to have a corresponding argument.

Many users wonder whether they should use the getopt package, optparse package, or argparse package. Here is some of the major differences:

Features available in getopt unavailable in optparse

1. As well as allowing one to specify options that take either no argument or a required argument like optparse, getopt also allows one to specify option with an optional argument.

Some features implemented in optparse package unavailable in getopt

1. Limited support for capturing positional arguments after the optional arguments when positional_arguments set to TRUE in parse_args
2. Automatic generation of an help option and printing of help text when encounters an "-h"
3. Option to specify default arguments for options as well the variable name to store option values

There is also new package argparse introduced in 2012 which contains all the features of both getopt and optparse but which has a dependency on Python 2.7 or 3.2+ and has not been used in production since 2008 or 2009 like the getopt and optparse packages.

Some Features unlikely to be implemented in getopt:

1. Support for multiple, identical flags, e.g. for "-m 3 -v 5 -v", the trailing "-v" overrides the preceding "-v 5", result is v=TRUE (or equivalent typecast).
2. Support for multi-valued flags, e.g. "-libpath=/usr/local/lib -libpath=/tmp/".
3. Support for lists, e.g. "-define os=linux -define os=redhat" would set result$os$linux=TRUE and result$os$redhat=TRUE.
4. Support for incremental, argument-less flags, e.g. "/path/to/script -vvv" should set v=3.
5. Support partial-but-unique string match on options, e.g. "-verb" and "--verbose" both match long flag "--verbose".
6. No support for mixing in positional arguments or extra arguments that don’t match any options. For example, you can’t do "my.R --arg1 1 foo bar baz" and recover "foo", "bar", "baz" as a list. Likewise for "my.R foo --arg1 1 bar baz".

Examples

#!/path/to/Rscript
library('getopt')
# get options, using the spec as defined by the enclosed list.
# we read the options from the default: commandArgs(TRUE).
spec = matrix(c(
  'verbose', 'v', 2, "integer",
  'help' , 'h', 0, "logical",
  'count' , 'c', 1, "integer",
  'mean' , 'm', 1, "double",
  'sd'    , 's', 1, "double"
), byrow=TRUE, ncol=4)
opt = getopt(spec)

# if help was asked for print a friendly message
# and exit with a non-zero error code
if ( !is.null(opt$help) ) {
  cat(getopt(spec, usage=TRUE))
  q(status=1)
}

# set some reasonable defaults for the options that are needed,
# but were not specified.
if ( is.null(opt$mean ) ) { opt$mean = 0 }
if ( is.null(opt$sd ) ) { opt$sd = 1 }
if ( is.null(opt$count ) ) { opt$count = 10 }
if ( is.null(opt$verbose ) ) { opt$verbose = FALSE }

# print some progress messages to stderr, if requested.
if ( opt$verbose ) { write("writing...", stderr()) }

# do some operation based on user input.
cat(paste(rnorm(opt$count,mean=opt$mean, sd=opt$sd), collapse="\n"))
cat("\n")

# signal success and exit.
# q(status=0)
**get_Rscript_filename**

Returns file name of calling Rscript

---

**Description**

dget_Rscript_filename returns the file name of calling Rscript

**Usage**

get_Rscript_filename()

**Value**

A string with the filename of the calling script. If not found (i.e. you are in an interactive session) returns NA.

---

**sort_list**

Recursively sorts a list

---

**Description**

sort_list returns a sorted list

**Usage**

sort_list(unsorted_list)

**Arguments**

unsorted_list A list.

**Value**

A sorted list.
