Package ‘ggplotlyExtra’

December 2, 2019

Title Extra Convenience Functions for ‘Plotly’

Version 0.0.1

Author Omar I. Elashkar <omar.ibrahim@miuegypt.edu.eg>

Maintainer Omar I. Elashkar <omar.ibrahim@miuegypt.edu.eg>

Depends R (>= 3.5.0)

Description Convenience functions for smooth conversion from ‘ggplot’ to ‘plotly’ where the conversion using ggplotly() usually gives an unexpected labels. The package ease the process of making a ‘plotly’ figures generated from ‘ggplot2’ object more aesthetic in terms of labels and customizability.

Imports ggplot2, plotly, rlang

R topics documented:

ggplotly_histogram

Index
Description

Create `ggplot2` histogram that translate nicely to `plotly`.

Usage

```r
ggplotly_histogram(data = NULL, mapping = NULL, position = "stack",
\[,..., binwidth = NULL, na.rm = FALSE, show.legend = NA\])
```

Arguments

data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the
call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be
fortified to produce a data frame. See `fortify()` for which variables will be
created.
A function will be called with a single argument, the plot data. The return
value must be a `data.frame`, and will be used as the layer data. A function
can be created from a formula (e.g. `~ head(.x,10)`).

mapping Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes` = TRUE (the default), it is combined with the default mapping at the top level of
the plot. You must supply mapping if there is no plot mapping.

position Position adjustment, either as a string, or the result of a call to a position adjust-
ment function.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set
an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also
be parameters to the paired geom/stat.

binwidth The width of the bins. Can be specified as a numeric value or as a function that
calculates width from unscaled x. Here, "unscaled x" refers to the original x val-
ues in the data, before application of any scale transformation. When specifying
a function along with a grouping structure, the function will be called once per
group. The default is to use bins bins that cover the range of the data. You
should always override this value, exploring multiple widths to find the best to
illustrate the stories in your data.
The bin width of a date variable is the number of days in each time; the bin
width of a time variable is the number of seconds.

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if
any aesthetics are mapped. FALSE never includes, and TRUE always includes. It
can also be a named logical vector to finely select the aesthetics to display.
Details

`ggplotly_histogram()` is a function that is used to create a `ggplot2` histogram, yet on conversion to `plotly` using `ggplotly()`, the resulted plot will hold the correct labeling information, which are "Range", "Count" and "Density".

Value

ggplot bar layer

Examples

```r
library(ggplot2)
library(plotly)

# create the histogram using `ggplotly_histogram()`
p <- ggplot() + ggplotly_histogram(data = ToothGrowth, mapping = aes(len)) +
xlab("len")

# convert `ggplot` object to `plotly` object
ggplotly(p, tooltip = c("Range", "count", "density"))
```
