Package ‘ggraph’

May 20, 2020

Type Package
Title An Implementation of Grammar of Graphics for Graphs and Networks
Version 2.0.3
Maintainer Thomas Lin Pedersen <thomasp85@gmail.com>
Description The grammar of graphics as implemented in ggplot2 is a poor fit for graph and network visualizations due to its reliance on tabular data input. ggraph is an extension of the ggplot2 API tailored to graph visualizations and provides the same flexible approach to building up plots layer by layer.

autograph

**Quickplot wrapper for networks**

**Description**

This function is intended to quickly show an overview of your network data. While it returns a ggraph object that layers etc can be added to, it is limited in use and should not be used as a foundation for more complicated plots. It allows colour, labeling and sizing of nodes and edges, and the exact combination of layout and layers will depend on these as well as the features of the network. The output of this function may be fine-tuned at any release and should not be considered stable. If a plot should be reproducible it should be created manually.

**Usage**

```r
autograph(graph, ...)
```

## Default S3 method:

```r
autograph(
  graph,
  ...,  
  node_colour = NULL,
  edge_colour = NULL,
  node_size = NULL,
  edge_width = NULL,
  node_label = NULL,
  edge_label = NULL
)
```

**Arguments**

- **graph**: An object coercible to a tbl_graph
- **...**: arguments passed on to methods
- **node_colour, edge_colour**: Colour mapping for nodes and edges
- **node_size, edge_width**: Size/width mapping for nodes and edges
- **node_label, edge_label**: Label mapping for nodes and edges

**Examples**

```r
library(tidygraph)
gr <- create_notable('herschel') %>%
  mutate(class = sample(letters[1:3], n(), TRUE)) %>%
  mutate(weight = runif(n()))
# Standard graph
```
facet_edges

autograph(gr)

# Adding node labels will cap edges
autograph(gr, node_label = class)

# Use tidygraph calls for mapping
autograph(gr, node_size = centrality_pagerank())

# Trees are plotted as dendrograms
iris_tree <- hclust(dist(iris[1:4], method = 'euclidean'), method = 'ward.D2')
autograph(iris_tree)

facet_edges

Create small multiples based on edge attributes

Description

This function is equivalent to ggplot2::facet_wrap() but only facets edges. Nodes are repeated in every panel.

Usage

facet_edges(
  facets,
  nrow = NULL,
  ncol = NULL,
  scales = "fixed",
  shrink = TRUE,
  labeller = "label_value",
  as.table = TRUE,
  switch = NULL,
  drop = TRUE,
  dir = "h",
  strip.position = "top"
)

Arguments

facets A set of variables or expressions quoted by vars() and defining faceting groups on the rows or columns dimension. The variables can be named (the names are passed to labeller).
For compatibility with the classic interface, can also be a formula or character vector. Use either a one sided formula, ~a + b, or a character vector, c("a", "b").

nrow Number of rows and columns.
ncol Number of rows and columns.
facets

scales Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")?

shrink If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.

labeller A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with vars(cyl, am). Each output column gets displayed as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with labeller(). You can use different labeling functions for different kind of labels, for example use label_parsed() for formatting facet labels. label_value() is used by default, check it for more details and pointers to other options.

as.table If TRUE, the default, the facets are laid out like a table with highest values at the bottom-left. If FALSE, the facets are laid out like a plot with the highest value at the top-right.

switch By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".

drop If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.

dir Direction: either "h" for horizontal, the default, or "v", for vertical.

strip.position By default, the labels are displayed on the top of the plot. Using strip.position it is possible to place the labels on either of the four sides by setting strip.position = c("top", "bottom", "left", "right")

See Also

Other ggraph-facets: facet_graph(), facet_nodes()

Examples

g <- tidygraph::as_tbl_graph(highschool)

```r

ggraph(g) + geom_edge_link() + geom_node_point() + facet_edges(~year)
```

facet_graph Create a grid of small multiples by node and/or edge attributes
Description

This function is equivalent to `ggplot2::facet_grid()` in that it allows for building a grid of small multiples where rows and columns correspond to a specific data value. While `ggplot2::facet_grid()` could be used it would lead to unexpected results as it is not possible to specify whether you are referring to a node or an edge attribute. Furthermore `ggplot2::facet_grid()` will draw edges in panels even though the panel does not contain both terminal nodes. `facet_graph` takes care of all of these issues, allowing you to define which data type the rows and columns are referencing as well as filtering the edges based on the nodes in each panel (even when nodes are not drawn).

Usage

```r
facet_graph(
  facets,
  row_type = "edge",
  col_type = "node",
  margins = FALSE,
  scales = "fixed",
  space = "fixed",
  shrink = TRUE,
  labeller = "label_value",
  as.table = TRUE,
  switch = NULL,
  drop = TRUE
)
```

Arguments

- **facets** This argument is soft-deprecated, please use `rows` and `cols` instead.
- **row_type, col_type** Either 'node' or 'edge'. Which data type is being facetted in the rows and columns. Default is to facet on nodes column wise and on edges row wise.
- **margins** Either a logical value or a character vector. Margins are additional facets which contain all the data for each of the possible values of the faceting variables. If `FALSE`, no additional facets are included (the default). If `TRUE`, margins are included for all faceting variables. If specified as a character vector, it is the names of variables for which margins are to be created.
- **scales** Are scales shared across all facets (the default, "fixed"), or do they vary across rows ("free_x"), columns ("free_y"), or both rows and columns ("free")?
- **space** If "fixed", the default, all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary. This setting has no effect unless the appropriate scales also vary.
- **shrink** If `TRUE`, will shrink scales to fit output of statistics, not raw data. If `FALSE`, will be range of raw data before statistical summary.
- **labeller** A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with `var(cyl, am)`. Each output column gets displayed
facet_nodes

Create small multiples based on node attributes

Description

This function is equivalent to ggplot2::facet_wrap() but only facets nodes. Edges are drawn if their terminal nodes are both present in a panel.

Usage

facet_nodes(
  facets,
  nrow = NULL,
  ncol = NULL,
  scales = "fixed",
)
facet_nodes

shrink = TRUE,
labeller = "label_value",
as.table = TRUE,
switch = NULL,
drop = TRUE,
dir = "h",
strip.position = "top"
)

Arguments

facets A set of variables or expressions quoted by vars() and defining faceting groups on the rows or columns dimension. The variables can be named (the names are passed to labeller).

For compatibility with the classic interface, can also be a formula or character vector. Use either a one sided formula, ~a + b, or a character vector, c("a","b").
nrow Number of rows and columns.
ncol Number of rows and columns.
scales Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x","free_y")?
shrink If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.
labeller A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with vars(cyl,am). Each output column gets displayed as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with labeller(). You can use different labeling functions for different kind of labels, for example use label_parsed() for formatting facet labels. label_value() is used by default, check it for more details and pointers to other options.
as.table If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.
switch By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".
drop If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.
dir Direction: either "h" for horizontal, the default, or "v", for vertical.
strip.position By default, the labels are displayed on the top of the plot. Using strip.position it is possible to place the labels on either of the four sides by setting strip.position = c("top","bottom","left","right")

Other ggraph-facets: `facet_edges()`, `facet_graph()`

Examples

```r
library(tidygraph)
gr <- as_tbl_graph(highschool) %>%
  mutate(popularity = as.character(cut(centrality_degree(mode = 'in'),
    breaks = 3,
    labels = c('low', 'medium', 'high')))
)ggraph(gr) +
  geom_edge_link() +
  geom_node_point() +
  facet_nodes(~popularity)
```

---

**flare**  
*The class hierarchy of the flare visualization library*

Description

This dataset contains the graph that describes the class hierarchy for the Flare ActionScript visualization library. It contains both the class hierarchy as well as the import connections between classes. This dataset has been used extensively in the D3.js documentation and examples and are included here to make it easy to redo the examples in ggraph.

Usage

```r
flare
```

Format

A list of three data.frames describing the software structure of flare:

- **edges**  This data.frame maps the hierarchical structure of the class hierarchy as an edgelist, with the class in `from` being the superclass of the class in `to`.
- **vertices** This data.frame gives additional information on the classes. It contains the full name, size and short name of each class.
- **imports** This data.frame contains the class imports for each class implementation. The `from` column gives the importing class and the `to` column gives the import.

Source

The data have been adapted from the JSON downloaded from [https://gist.github.com/mbostock/1044242#file-readme-flare-imports-json](https://gist.github.com/mbostock/1044242#file-readme-flare-imports-json) courtesy of Mike Bostock. The Flare framework is the work of the UC Berkeley Visualization Lab.
Define simple shapes for line capping

Description

This set of functions makes it easy to define shapes at the terminal points of edges that are used to shorten the edges. The shapes themselves are not drawn, but the edges will end at the boundary of the shape rather than at the node position. This is especially relevant when drawing arrows at the edges as the arrows will be partly obscured by the node unless the edge is shortened. Edge shortening is dynamic and will update as the plot is resized, making sure that the capping remains at an absolute distance to the end point.

Usage

```r
geometry(
  type = "circle",
  width = 1,
  height = width,
  width_unit = "cm",
  height_unit = width_unit
)

circle(radius = 1, unit = "cm")

square(length = 1, unit = "cm")

ellipsis(a = 1, b = 1, a_unit = "cm", b_unit = a_unit)

rectangle(width = 1, height = 1, width_unit = "cm", height_unit = width_unit)

label_rect(label, padding = margin(1, 1, 1.5, 1, "mm"), ...)

is.geometry(x)
```

Arguments

- `type`: The type of geometry to use. Currently 'circle' and 'rect' is supported.
- `width, height, length, radius, a, b`: The dimensions of the shape.
- `unit, width_unit, height_unit, a_unit, b_unit`: The unit for the numbers given.
- `label`: The text to be enclosed
- `padding`: extra size to be added around the text using the `ggplot2::margin()` function
- `...`: Passed on to `grid::gpar()`
- `x`: An object to test for geometry inheritance
geom_axis_hive

Details
geometry is the base constructor, while the rest are helpers to save typing. circle creates circles width a given radius, square creates squares at a given side length, ellipsis creates ellipses with given a and b values (width and height radii), and rectangle makes rectangles of a given width and height. label_rect is a helper that, given a list of strings and potentially formatting options creates a rectangle that encloses the string.

Value
A geometry object encoding the specified shape.

Examples
geometry(c('circle', 'rect', 'rect'), 1:3, 3:1)
circle(1:4, 'mm')
label_rect(c('some', 'different', 'words'), fontsize = 18)

geom_axis_hive

Draw rectangular bars and labels on hive axes

Description
This function lets you annotate the axes in a hive plot with labels and color coded bars.

Usage
geom_axis_hive(
  mapping = NULL,
  data = NULL,
  position = "identity",
  label = TRUE,
  axis = TRUE,
  show.legend = NA,
  ...
)

Arguments

mapping Set of aesthetic mappings created by aes() or aes(.). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

**position**

Position adjustment, either as a string, or the result of a call to a position adjustment function.

**label**

Should the axes be labelled. Defaults to `TRUE`.

**axis**

Should a rectangle be drawn along the axis. Defaults to `TRUE`.

**show.legend**

Logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

**...**

Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

### Aesthetics

`geom_axis_hive` understand the following aesthetics.

- `alpha`
- `colour`
- `fill`
- `size`
- `linetype`
- `label_size`
- `family`
- `fontface`
- `lineheight`

### Author(s)

Thomas Lin Pedersen

### Examples

```r
# Plot the flare import graph as a hive plot
library(tidygraph)
flareGr <- as_tbl_graph(flare$imports) %>%
  mutate(
    type = dplyr::case_when(
      centrality_degree(mode = 'in') == 0 ~ 'Source',
      centrality_degree(mode = 'out') == 0 ~ 'Sink',
      TRUE ~ 'Both'
    )
```
geom_conn_bundle

Create hierarchical edge bundles between node connections

Description
Hierarchical edge bundling is a technique to introduce some order into the hairball structure that can appear when there's a lot of overplotting and edge crossing in a network plot. The concept requires that the network has an intrinsic hierarchical structure that defines the layout but is not shown. Connections between points (that is, not edges) are then drawn so that they loosely follows the underlying hierarchical structure. This results in a flow-like structure where lines that partly move in the same direction will be bundled together.

Usage
geom_conn_bundle(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  n = 100,
  tension = 0.8,
  ...
)

geom_conn_bundle2(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  n = 100,
  tension = 0.8,
geom_conn_bundle

...)

geom_conn_bundle0(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  tension = 0.8,
  ...
)

Arguments

mapping Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes(). By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data The result of a call to get_con()
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow Arrow specification, as created by grid::arrow()
lineend Line end style (round, butt, square).
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
n The number of points to create along the path.
tension How "loose" should the bundles be. 1 will give very tight bundles, while 0 will turn of bundling completely and give straight lines. Defaults to 0.8
...

Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

gem_conn_bundle* understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• group
• circular
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

Computed variables

index  The position along the path (not computed for the *0 version)

Note

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write edge_colour within the aes() call as colour will automatically be renamed appropriately.

  coord_fixed() +
  ggforce::theme_no_axes()
**geom_edge_arc**  

dırect as Arcs

**Description**

This geom is mainly intended for arc linear and circular diagrams (i.e. used together with `layout_tbl_graph_linear()`), though it can be used elsewhere. It draws edges as arcs with a height proportional to the distance between the nodes. Arcs are calculated as beziers. For linear layout the placement of control points are related to the curvature argument and the distance between the two nodes. For circular layout the control points are placed on the same angle as the start and end node at a distance related to the distance between the nodes.

**Usage**

```r
geom_edge_arc(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  fold = FALSE,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colours = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
```

```r
geom_edge_arc2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  fold = FALSE,
  lineend = "butt",
```
linejoin = "round",
linemitre = 1,
label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
...

curvature
)

geom_edge_arc0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  fold = fold,
  ...
-curvature
)

Arguments

mapping Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes(). By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow Arrow specification, as created by grid::arrow().
strength The bend of the curve. 1 approximates a halfcircle while 0 will give a straight line. Negative number will change the direction of the curve. Only used if circular = FALSE.
n The number of points to create along the path.
fold Logical. Should arcs appear on the same side of the nodes despite different directions. Default to FALSE.
lineend Line end style (round, butt, square).
linejoin  Line join style (round, mitre, bevel).
linemitre  Line mitre limit (number greater than 1).
label_colour  The colour of the edge label. If NA it will use the colour of the edge.
label_alpha  The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse  If TRUE, the labels will be parsed into expressions and displayed as described in `grDevices::plotmath()`.
check_overlap  If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling `geom_label()` or `geom_text()`.
angle_calc  Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip  Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge  A `grid::unit()` giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'
label_push  A `grid::unit()` giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.
curvature  Deprecated. Use `strength` instead.

Aesthetics

`geom_edge_arc` and `geom_edge_arc0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- `x`
- `y`
- `xend`
- `yend`
- `circular`
- `edge_colour`
- `edge_width`
- `edge_linetype`
- `edge_alpha`
- `filter`
geom_edge_arc2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- `x`
- `y`
- `group`
- `circular`
- `edge_colour`
- `edge_width`
- `edge_linetype`
- `edge_alpha`
- `filter`

geom_edge_arc and geom_edge_arc2 furthermore takes the following aesthetics.

- `start_cap`
- `end_cap`
- `label`
- `label_pos`
- `label_size`
- `angle`
- `hjust`
- `vjust`
- `family`
- `fontface`
- `lineheight`

**Computed variables**

`index` The position along the path (not computed for the *0 version)

**Edge variants**

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point.
geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that take a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

### Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

geom_edge_bend

**Draw edges as diagonals**

**Description**

This geom draws edges as cubic bezier curves with the control points positioned along the elbow edge. It has the appearance of a softened elbow edge with the hard angle substituted by a tapered bend.

**Usage**

```r
geom_edge_bend(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
```

```r
geom_edge_bend2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
```
label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
...
)

geom_edge_bend0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  lineend = "butt",
  show.legend = NA,
  ...
)

Arguments

mapping Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes(). By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
arow Arrow specification, as created by grid::arrow().
strength The strength of the curvature of the bend. 0 will result in a straight line while 1 will give a strong arc.
flipped Logical, Has the layout been flipped by reassigning the mapping of x, y etc?
n The number of points to create along the path.
lineend Line end style (round, butt, square).
linejoin Line join style (round, mitre, bevel).
linemitre Line mitre limit (number greater than 1).
label_colour The colour of the edge label. If NA it will use the colour of the edge.
label_alpha The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse If TRUE, the labels will be parsed into expressions and displayed as described in grDevices::plotmath().
check_overlap  If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().

angle_calc  Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.

force_flip  Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.

label_dodge  A grid::unit() giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'

label_push  A grid::unit() giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

Aesthetics

geom_edge_bend and geom_edge_bend0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• xend
• yend
• circular
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_bend2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• group
• circular
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_bend and geom_edge_bend2 furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight

Computed variables

index  The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the
drawing. The default (no numeric postfix) generate a number of points (n) along the edge and
draws it as a path. Each point along the line has a numeric value associated with it giving the
position along the path, and it is therefore possible to show the direction of the edge by mapping
to this e.g. colour = stat(index). The version postfixed with a "2" uses the "long" edge format
(see get_edges()) and makes it possible to interpolate node parameter between the start and end
node along the edge. It is considerable less performant so should only be used if this is needed.
The version postfixed with a "0" draws the edge in the most performant way, often directly using an
appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases
where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point.
geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that
takes a geometry() specification and dynamically caps the termini of the edges based on the given
specifications. This means that if end_cap = circle(1, cm) the edges will end at a distance of
1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason
this is not a separate geom is that in order for the label to know the location of the edge it needs
to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be
used to specify where along the edge it should be drawn by supplying a number between 0 and 1.
The label_size aesthetic can be used to control the size of the label. Often it is needed to have the
label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

`geom_edge_density`  
*Show edges as a density map*

Description

This geom makes it possible to add a layer showing edge presence as a density map. Each edge is converted to n points along the line and a jitter is applied. Based on this dataset a two-dimensional kernel density estimation is applied and plotted as a raster image. The density is mapped to the alpha level, making it possible to map a variable to the fill.
geom_edge_density

Usage

gem_edge_density(
  mapping = NULL,
  data = get_edges("short"),
  position = "identity",
  show.legend = NA,
  n = 100,
  ...
)

Arguments

- **mapping**: Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default, x, y, xend, yend, group, and circular are mapped to x, y, xend, yend, edge.id, and circular in the edge data.

- **data**: The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for guidance on the format). See `get_edges()` for more details on edge extraction.

- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **show.legend**: Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **n**: The number of points to estimate in the x and y direction, i.e. the resolution of the raster.

- **...**: Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Aesthetics

gem_edge_density understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x** y **xend** **yend** edge_fill filter

Computed variables

- **x, y**: The coordinates for each pixel in the raster

- **density**: The density associated with the pixel

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

Examples

```r
require(tidygraph)
gr <- create_notable("bull") %>%
  activate(edges) %>%
  mutate(class = sample(letters[1:3], n(), replace = TRUE))
ggraph(gr, "stress") +
  geom_edge_density(aes(fill = class)) +
  geom_edge_link() + geom_node_point()
```

Description

This geom draws edges as diagonal bezier curves. The name comes from D3.js where this shape was called diagonals until it was renamed to links. A diagonal in this context is a quadratic bezier with the control points positioned halfway between the start and end points but on the same axis. This produces a pleasing fan-in, fan-out line that is mostly relevant for hierarchical layouts as it implies an overall directionality in the plot.

Usage

```r
geom_edge_diagonal(
mapping = NULL,
data = get_edges(),
position = "identity",
arow = NULL,
strength = 1,
flipped = FALSE,
n = 100,
lineend = "butt",
linejoin = "round",
linemitre = 1,
label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
```
Arguments

mapping Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
geom_edge_diagonal

- **data**
  The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction.

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **arrow**
  Arrow specification, as created by `grid::arrow()`.

- **strength**
  The strength of the curvature of the diagonal. 0 will result in a straight line while 1 will give the familiar S-shape.

- **flipped**
  Logical, Has the layout been flipped by reassigning the mapping of x, y etc?

- **n**
  The number of points to create along the path.

- **lineend**
  Line end style (round, butt, square).

- **linejoin**
  Line join style (round, mitre, bevel).

- **linemitre**
  Line mitre limit (number greater than 1).

- **label_colour**
  The colour of the edge label. If NA it will use the colour of the edge.

- **label_alpha**
  The opacity of the edge label. If NA it will use the opacity of the edge.

- **label_parse**
  If TRUE, the labels will be parsed into expressions and displayed as described in `grDevices::plotmath()`.

- **check_overlap**
  If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling `geom_label()` or `geom_text()`.

- **angle_calc**
  Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' the label will be written along the edge direction. If 'across' the label will be written across the edge direction.

- **force_flip**
  Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.

- **label_dodge**
  A `grid::unit()` giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'

- **label_push**
  A `grid::unit()` giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'

- **show.legend**
  Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **...**
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

**Aesthetics**

**geom_edge_elbow**

This geom draws edges as an angle in the same manner as known from classic dendrogram plots of hierarchical clustering results. In case a circular transformation has been applied the first line segment will be drawn as an arc as expected. This geom is only applicable to layouts that return a direction for the edges (currently `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_partition()` and `layout_tbl_graph_igraph()` with the "tree" algorithm).

**Description**

show.legend = NA,
```

Arguments

- **mapping** Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
- **data** The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction.
- **position** Position adjustment, either as a string, or the result of a call to a position adjustment function.
- **arrow** Arrow specification, as created by `grid::arrow()`.
- **strength** How bend the elbow should be. 1 will give a right angle, while 0 will give a straight line. Ignored for circular layouts.
- **flipped** Logical, Has the layout been flipped by reassigning the mapping of x, y etc?
- **n** The number of points to create along the path.
**geom_edge_elbow**

- **lineend** Line end style (round, butt, square).
- **linejoin** Line join style (round, mitre, bevel).
- **linemitre** Line mitre limit (number greater than 1).
- **label_colour** The colour of the edge label. If NA it will use the colour of the edge.
- **label_alpha** The opacity of the edge label. If NA it will use the opacity of the edge.
- **label_parse** If TRUE, the labels will be parsed into expressions and displayed as described in `grDevices::plotmath()`.
- **check_overlap** If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling `geom_label()` or `geom_text()`.
- **angle_calc** Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
- **force_flip** Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
- **label_dodge** A `grid::unit()` giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'
- **label_push** A `grid::unit()` giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
- **show.legend** logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
- **...** Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

**Aesthetics**

`geom_edge_elbow` and `geom_edge_elbow0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- **circular**
- **direction**
- **edge_colour**
- **edge_width**
- **edge_linetype**
- **edge_alpha**

**Edge variants**

Many `geom_edge_*` layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.
Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point. geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

geom_edge_elbow0(aes(colour = class))
```
geom_edge_fan

Description

This geom draws edges as cubic beziers with the control point positioned half-way between the nodes and at an angle dependent on the presence of parallel edges. This results in parallel edges being drawn in a non-overlapping fashion resembling the standard approach used in igraph::plot.igraph(). Before calculating the curvature the edges are sorted by direction so that edges going the same way will be adjacent. This geom is currently the only choice for non-simple graphs if edges should not be overplotted.

Usage

geom_edge_fan(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...,
  spread
)

geom_edge_fan2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
geom_edge_fan

label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
...,
spread
)

geom_edge_fan0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  ...,
  spread
)

Arguments

mapping Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes_. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
arow Arrow specification, as created by grid::arrow().
strength Modify the width of the fans strength > 1 will create wider fans while the reverse will make them more narrow.
n The number of points to create along the path.
lineend Line end style (round, butt, square).
linejoin Line join style (round, mitre, bevel).
linemitre Line mitre limit (number greater than 1).
label_colour The colour of the edge label. If NA it will use the colour of the edge.
label_alpha The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse If TRUE, the labels will be parsed into expressions and displayed as described in grDevices::plotmath().
check_overlap: If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().

angle_calc: Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' the label will be written along the edge direction. If 'across' the label will be written across the edge direction.

force_flip: Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on its head. Default to TRUE.

label_dodge: A grid::unit() giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'.

label_push: A grid::unit() giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'.

show.legend: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

...: Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

spread: Deprecated. Use strength instead.

Aesthetics

gem_edge_fan and geom_edge_fan0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- xend
- yend
- from
- to
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

gem_edge_fan2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- group
• from
• to
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_fan and geom_edge_fan2 furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the
drawing. The default (no numeric postfix) generate a number of points (n) along the edge and
draws it as a path. Each point along the line has a numeric value associated with it giving the
position along the path, and it is therefore possible to show the direction of the edge by mapping
to this e.g. colour = stat(index). The version postfixed with a "2" uses the "long" edge format
(see get_edges()) and makes it possible to interpolate node parameter between the start and end
node along the edge. It is considerably less performant so should only be used if this is needed.
The version postfixed with a "0" draws the edge in the most performant way, often directly using an
appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases
where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point.
geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that
takes a geometry() specification and dynamically caps the termini of the edges based on the given
specifications. This means that if end_cap = circle(1, 'cm') the edges will end at a distance of
1cm even during resizing of the plot window.
All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

```
geom_edge_hive

Draw edges in hive plots

Description

This geom is only intended for use together with the hive layout. It draws edges between nodes as bezier curves, with the control points positioned at the same radii as the start or end point, and at a distance defined by the curvature argument.

Usage

geom_edge_hive(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)

geom_edge_hive2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
  ..., 
curvature
)

geom_edge_hive0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  ..., 
curvature
)

Arguments

 mapping Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes(). By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.

data The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

arrow Arrow specification, as created by grid::arrow().

strength The curvature of the bezier. Defines the distance from the control points to the midpoint between the start and end node. 1 means the control points are positioned halfway between the nodes and the middle of the two axes, while 0 means it coincide with the nodes (resulting in straight lines)

n The number of points to create along the path.

lineend Line end style (round, butt, square).

linejoin Line join style (round, mitre, bevel).

linemitre Line mitre limit (number greater than 1).

label_colour The colour of the edge label. If NA it will use the colour of the edge.

label_alpha The opacity of the edge label. If NA it will use the opacity of the edge.

label_parse If TRUE, the labels will be parsed into expressions and displayed as described in grDevices::plotmath().
check_overlap  If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().

angle_calc  Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.

force_flip  Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on its head. Default to TRUE.

label_dodge  A grid::unit() giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'

label_push  A grid::unit() giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

...  Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

curvature  Deprecated. Use strength instead.

Aesthetics

geom_edge_hive and geom_edge_hive0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- xend
- yend
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_hive2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- group
- edge_colour
- edge_width
• edge_linetype
• edge_alpha
• filter

**geom_edge_hive** and **geom_edge_hive2** furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight

**Computed variables**

**index** The position along the path (not computed for the *0 version)

**Edge variants**

Many **geom_edge_*** layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point. **geom_edge_*** and **geom_edge_*2** supports this through the start_cap and end_cap aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1,'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All **geom_edge_*** and **geom_edge_*2** have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot...
dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

`geom_edge_link`  
*Draw edges as straight lines between nodes*
Description

This geom draws edges in the simplest way - as straight lines between the start and end nodes. Not much more to say about that...

Usage

geom_edge_link(
  mapping = NULL,
  data = get_edges("short"),
  position = "identity",
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)

geom_edge_link2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
geom_edge_link

geom_edge_link0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  ...
)

Arguments

mapping  Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes_.
By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, 
edge.id and circular in the edge data.

data     The return of a call to get_edges() or a data.frame giving edges in correct 
format (see details for for guidance on the format). See get_edges() for more 
details on edge extraction.

position Position adjustment, either as a string, or the result of a call to a position adjust-
ment function.

arrow    Arrow specification, as created by grid::arrow().

n        The number of points to create along the path.

lineend Line end style (round, butt, square).

linejoin Line join style (round, mitre, bevel).

linemitre Line mitre limit (number greater than 1).

label_colour The colour of the edge label. If NA it will use the colour of the edge.

label_alpha The opacity of the edge label. If NA it will use the opacity of the edge.

label_parse If TRUE, the labels will be parsed into expressions and displayed as described in
grDevices::plotmath().

check_overlap If TRUE, text that overlaps previous text in the same layer will not be plotted.
check_overlap happens at draw time and in the order of the data. Therefore 
data should be arranged by the label column before calling geom_label() or 
geom_text().

angle_calc Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic 
of the geom. If 'along' The label will be written along the edge direction. If
'across' the label will be written across the edge direction.

force_flip Logical. If angle_calc is either 'along' or 'across' should the label be flipped
if it is on it's head. Default to TRUE.

label_dodge A grid::unit() giving a fixed vertical shift to add to the label in case of
angle_calc is either 'along' or 'across'

label_push A grid::unit() giving a fixed horizontal shift to add to the label in case of
angle_calc is either 'along' or 'across'

show.legend logical. Should this layer be included in the legends? NA, the default, includes if
any aesthetics are mapped. FALSE never includes, and TRUE always includes. It
can also be a named logical vector to finely select the aesthetics to display.
... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired `geom/stat`.

**Edge variants**

Many `geom_edge_*` layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1,"cm")` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1.

The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

**Aesthetics**

`geom_edge_link` and `geom_edge_link0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- `x`
- `y`
- `xend`
- `yend`
- `edge_colour`
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_link2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• group
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_link and geom_edge_link2 furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight

**Computed variables**

**index** The position along the path (not computed for the *0 version)

**geom_edge_loop**

*Draw edges as diagonals*

**Description**

This geom draws edge loops (edges starting and ending at the same node). Loops are drawn as bezier curves starting and ending at the position of the node and with control points protruding at an angle and in a direction specified in the call. As the start and end node is always the same no *2 method is provided. Loops can severely clutter up your visualization which is why they are decoupled from the other edge drawings. Only plot them if they are of importance. If the graph doesn’t contain any loops the geom adds nothing silently.

**Usage**

```r
geom_edge_loop(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
)```
Arguments

mapping Set of aesthetic mappings created by \texttt{ggplot2::aes()} or \texttt{ggplot2::aes()}. By default \texttt{x, y, xend, yend, group and circular} are mapped to \texttt{x, y, xend, yend, edge.id} and \texttt{circular} in the edge data.

data The return of a call to \texttt{get_edges()} or a \texttt{data.frame} giving edges in correct format (see details for for guidance on the format). See \texttt{get_edges()} for more details on edge extraction.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

arrow Arrow specification, as created by \texttt{grid::arrow()}.

n The number of points to create along the path.

lineend Line end style (round, butt, square).

linejoin Line join style (round, mitre, bevel).

linemitre Line mitre limit (number greater than 1).

label_colour The colour of the edge label. If \texttt{NA} it will use the colour of the edge.

label_alpha The opacity of the edge label. If \texttt{NA} it will use the opacity of the edge.

label_parse If \texttt{TRUE}, the labels will be parsed into expressions and displayed as described in \texttt{grDevices::plotmath()}.

check_overlap If \texttt{TRUE}, text that overlaps previous text in the same layer will not be plotted. \texttt{check_overlap} happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling \texttt{geom_label()} or \texttt{geom_text()}.

angle_calc Either \texttt{`none`, `along`, or `across`}. If \texttt{`none`} the label will use the angle aesthetic of the geom. If \texttt{`along`} The label will be written along the edge direction. If \texttt{`across`} the label will be written across the edge direction.

force_flip Logical. If \texttt{angle_calc} is either \texttt{`along`} or \texttt{`across`} should the label be flipped if it is on it’s head. Default to \texttt{TRUE}.

label_dodge A \texttt{grid::unit()} giving a fixed vertical shift to add to the label in case of \texttt{angle_calc} is either \texttt{`along`} or \texttt{`across`}

label_push A \texttt{grid::unit()} giving a fixed horizontal shift to add to the label in case of \texttt{angle_calc} is either \texttt{`along`} or \texttt{`across`}
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

geom_edge_loop and geom_edge_loop0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- `x`
- `y`
- `from`
- `to`
- `span 90`
- `direction 45`
- `strength 1`
- `edge_colour`
- `edge_width`
- `edge_linetype`
- `edge_alpha`
- `filter`

geom_edge_loop furthermore takes the following aesthetics.

- `start_cap`
- `end_cap`
- `label`
- `label_pos`
- `label_size`
- `angle`
- `hjust`
- `vjust`
- `family`
- `fontface`
- `lineheight`

Computed variables

- `index` The position along the path (not computed for the *0 version)
**Edge variants**

Many `geom_edge_*` layers come in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points \( (n) \) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerably less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1,'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

**Examples**

```r
require(tidygraph)
gr <- as_tbl_graph(
  data.frame(from = c(1, 1, 2, 2, 3, 3, 3), to = c(1, 2, 2, 3, 3, 1, 2))
)
```
geom_edge_parallel

Description

This geom draws multi edges as parallel lines. The edges are first sorted by direction and then shifted a fixed amount so that all edges are visible.

Usage

```r
geom_edge_parallel(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  sep = unit(2, "mm"),
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
```

```r
geom_edge_parallel2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  sep = unit(2, "mm"),
  n = 100,
)```
geom_edge_parallel

```r
lineend = "butt",
linejoin = "round",
linemitre = 1,
label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
...
)
```

```r
geom_edge_parallel0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  sep = unit(2, "mm"),
  lineend = "butt",
  show.legend = NA,
  ...
)
```

**Arguments**

- **mapping**  
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes_()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.

- **data**  
  The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction.

- **position**  
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **arrow**  
  Arrow specification, as created by `grid::arrow()`.

- **sep**  
  The separation between parallel edges, given as a `grid::unit()`

- **n**  
  The number of points to create along the path.

- **lineend**  
  Line end style (round, butt, square).

- **linejoin**  
  Line join style (round, mitre, bevel).

- **linemitre**  
  Line mitre limit (number greater than 1).

- **label_colour**  
  The colour of the edge label. If NA it will use the colour of the edge.

- **label_alpha**  
  The opacity of the edge label. If NA it will use the opacity of the edge.

- **label_parse**  
  If TRUE, the labels will be parsed into expressions and displayed as described in `grDevices::plotmath()`.

check_overlap If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().

angle_calc Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.

force_flip Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.

label_dodge A grid::unit() giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'

label_push A grid::unit() giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

geom_edge_parallel and geom_edge_parallel0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- xend
- yend
- from
- to
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_parallel2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- group
- from
• to
  • edge_colour
  • edge_width
  • edge_linetype
  • edge_alpha
  • filter

geom_edge_parallel and geom_edge_parallel2 furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the
drawing. The default (no numeric postfix) generate a number of points (n) along the edge and
draws it as a path. Each point along the line has a numeric value associated with it giving the
position along the path, and it is therefore possible to show the direction of the edge by mapping
to this e.g. colour = stat(index). The version postfixed with a "2" uses the "long" edge format
(see get_edges()) and makes it possible to interpolate node parameter between the start and end
node along the edge. It is considerable less performant so should only be used if this is needed.
The version postfixed with a "0" draws the edge in the most performant way, often directly using an
appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases
where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point.
geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that
takes a geometry() specification and dynamically caps the termini of the edges based on the given
specifications. This means that if end_cap = circle(1, 'cm') the edges will end at a distance of
1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason
this is not a separate geom is that in order for the label to know the location of the edge it needs
to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

**Edge aesthetic name expansion**

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write edge_colour within the aes() call as colour will automatically be renamed appropriately.

**Examples**

```r
require(tidygraph)
gr <- create_notable("bull") %>%
  convert(to_directed) %>%
  bind_edges(data.frame(from = c(1, 2, 2, 3), to = c(2, 1, 3, 2))) %>%
  mutate(class = sample(letters[1:3], 9, TRUE)) %>%
  mutate(class = sample(c("x", "y"), 5, TRUE))

ggraph(gr, "stress") +
  geom_edge_parallel(aes(alpha = stat(index)))

ggraph(gr, "stress") +
  geom_edge_parallel2(aes(colour = node.class))

ggraph(gr, "stress") +
  geom_edge_parallel0(aes(colour = class))

# Use capping and sep to fine tune the look

ggraph(gr, "stress") +
  geom_edge_parallel(start_cap = circle(1), end_cap = circle(1),
                    arrow = arrow(length = unit(2, "mm")), sep = unit(4, "mm")) +
  geom_node_point(size = 12)
```
**Description**

This geom draws edges as glyphs with their x-position defined by the x-position of the start node, and the y-position defined by the y-position of the end node. As such it will result in a matrix layout when used in conjunction with `layout_tbl_graph_matrix()`.

**Usage**

```r
gem_edge_point(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  mirror = FALSE,
  show.legend = NA,
  ...
)
```

**Arguments**

- `mapping`  
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data. 

- `data`  
  The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction. 

- `position`  
  Position adjustment, either as a string, or the result of a call to a position adjustment function. 

- `mirror`  
  Logical. Should edge points be duplicated on both sides of the diagonal. Intended for undirected graphs. Default to FALSE. 

- `show.legend`  
  Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display. 

- `...`  
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat. 

**Aesthetics**

`geom_edge_point` understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden. 

- `x` 
- `y`
• edge_shape
• edge_colour
• edge_size
• edge_alpha
• filter

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

```

---

`geom_edge_span`  
**Draw edges as vertical spans**

**Description**

This edge geom is mainly intended for use with fabric layouts. It draws edges as vertical segments with an optional end shape adornment. Due to the special nature of fabric layouts where nodes are not a single point in space but a line, this geom doesn’t derive the x position from the location of the terminal nodes, but defaults to using the `edge_x` variable calculated by the fabric layout. If this geom is used with other layouts `x` and `xend` must be given explicitly.
Usage

```r
geom_edge_span(
  mapping = NULL,
  data = get_edges("short"),
  position = "identity",
  end_shape = NA,
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
```

```r
geom_edge_span2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  end_shape = NA,
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)
```

```r
geom_edge_span0(
  mapping = NULL,
  data = get_edges(),
```
position = "identity",
end_shape = NA,
arrow = NULL,
lineend = "butt",
show.legend = NA,
... )

Arguments

mapping Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.

data The return of a call to `get_edges()` or a dataframe giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

end_shape The adornment to put at the ends of the span. The naming follows the conventions of the shape aesthetic in `ggplot2::geom_point()`

arrow Arrow specification, as created by `grid::arrow()`.

n The number of points to create along the path.

lineend Line end style (round, butt, square).

linejoin Line join style (round, mitre, bevel).

linemitre Line mitre limit (number greater than 1).

label_colour The colour of the edge label. If NA it will use the colour of the edge.

label_alpha The opacity of the edge label. If NA it will use the opacity of the edge.

label_parse If TRUE, the labels will be parsed into expressions and displayed as described in `grDevices::plotmath()`.

check_overlap If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling `geom_label()` or `geom_text()`.

angle_calc Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.

force_flip Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.

label_dodge A `grid::unit()` giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'

label_push A `grid::unit()` giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
geom_edge_span logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

geom_edge_span and geom_edge_span0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• xend
• yend
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_span2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• group
• edge_colour
• edge_width
• edge_linetype
• edge_alpha
• filter

geom_edge_span and geom_edge_span2 furthermore takes the following aesthetics.

• start_cap
• end_cap
• label
• label_pos
• label_size
• angle
• hjust
• vjust
• family
• fontface
• lineheight
Computed variables

**index**  The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see get_edges()) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn’t lay on top or below the node point. geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that takes a geometry() specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

geom_edge_span(aes(colour = shadow_edge), end_shape = 'square') +
scale_edge_colour_manual(values = c('FALSE' = 'black', 'TRUE' = 'grey'))
```

---

### Description

This geom draws edges as tiles with their x-position defined by the x-position of the start node, and the y-position defined by the y-position of the end node. As such it will result in a matrix layout when used in conjunction with `layout_tbl_graph_matrix()`.

### Usage

```r
gem_edge_tile(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  mirror = FALSE,
  show.legend = NA,
  ...
)
```

### Arguments

- **mapping**: Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.

- **data**: The return of a call to `get_edges()` or a data.frame giving edges in correct format (see details for for guidance on the format). See `get_edges()` for more details on edge extraction.
position  

Position adjustment, either as a string, or the result of a call to a position adjustment function.

mirror  

Logical. Should edge points be duplicated on both sides of the diagonal. Intended for undirected graphs. Default to FALSE.

show.legend  

Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

...  

Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_tile` understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- `x`
- `y`
- `edge_fill`
- `edge_colour`
- `edge_size`
- `edge_alpha`
- `filter`

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

  activate(edges) %>%
  mutate(edge_group = as.character(.N()$group[1])) %>%
```
geom_node_arc_bar

Show nodes as thick arcs

Description

This geom is equivalent in functionality to `ggforce::geom_arc_bar()` and allows for plotting of nodes as arcs with an inner and outer radius scaled by the coordinate system. Its main use is currently in sunburst plots as created with circular partition layouts.

Usage

```r
geom_node_arc_bar(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

- **mapping**
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`.
  By default x and y are mapped to x0 and y0 in the node data.

- **data**
  The data to be displayed in this layer. There are three options:
  If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **show.legend**
  Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

geom_node_point understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x0
- y0
- r0
- r
- start
- end
- alpha
- colour
- fill
- shape
- size
- stroke
- filter

require(tidygraph)
gr <- tbl_graph(flare$vertices, flare$edges)
ggraph(gr, 'partition', circular = TRUE, weight = size) + geom_node_arc_bar()
```
**geom_node_circle**  
*Show nodes as circles*

**Description**

This geom is equivalent in functionality to `ggforce::geom_circle()` and allows for plotting of nodes as circles with a radius scaled by the coordinate system. Because of the geom's reliance on the coordinate system it will only produce true circles when combined with `ggplot2::coord_fixed()`.

**Usage**

```r
gem_node_circle(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

**Arguments**

- `mapping`  
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x and y are mapped to x0 and y0 in the node data.

- `data`  
  The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a `formula` (e.g. `~ head(.x,10)`).

- `position`  
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- `show.legend`  
  logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

- `...`  
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

**Aesthetics**

geom_node_point  Show nodes as points

Description

This geom is equivalent in functionality to ggplot2::geom_point() and allows for simple plotting of nodes in different shapes, colours and sizes.

Usage

geom_node_point(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
Arguments

- **mapping**: Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x and y are mapped to x and y in the node data.

- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **show.legend**: logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **...**: Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

  mutate(class = sample(letters[1:3], n(), replace = TRUE))

ggraph(gr, 'stress') + geom_node_point()
```

---

**geom_node_range**

*Show nodes as a line spanning a horizontal range*

**Description**

This geom is most useful together with the *fabric* layout for showing the horizontal span of each node.

**Usage**

```r
geom_node_range(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

**Arguments**

- **mapping** Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x is mapped to xmin, xend is mapped to xmax and y and yend are mapped to y in the node data.
- **data** The data to be displayed in this layer. There are three options:
  - If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.

<table>
<thead>
<tr>
<th>geom_node_text</th>
<th>Annotate nodes with text</th>
</tr>
</thead>
</table>

Description

These geoms are equivalent in functionality to `ggplot2::geom_text()` and `ggplot2::geom_label()` and allows for simple annotation of nodes.
Usage

```r
geom_node_text(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  check_overlap = FALSE,
  show.legend = NA,
  repel = FALSE,
  ...
)
```

```r
geom_node_label(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  label.padding = unit(0.25, "lines"),
  label.r = unit(0.15, "lines"),
  label.size = 0.25,
  show.legend = NA,
  repel = FALSE,
  ...
)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x and y are mapped to x and y in the node data.
- **data**: The data to be displayed in this layer. There are three options:
  - If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).
- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function. Cannot be jointly specified with nudge_x or nudge_y.
- **parse**: If TRUE, the labels will be parsed into expressions and displayed as described in `?plotmath`. 
nudge_x, nudge_y
Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.

check_overlap
If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

repel
If TRUE, text labels will be repelled from each other to avoid overlapping, using the GeomTextRepel geom from the ggrepel package.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

label.padding
Amount of padding around label. Defaults to 0.25 lines.

label.r
Radius of rounded corners. Defaults to 0.15 lines.

label.size
Size of label border, in mm.

Aesthetics

dim_node_text understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden. Italic aesthetics are required but not set by default

• x
• y
• label
• alpha
• angle
• colour
• family
• fontface
• hjust
• lineheight
• size
• vjust

```

---

**geom_node_tile**  
*Draw the rectangles in a treemap*

Description

A treemap is a space filling layout that recursively divides a rectangle to the children of the node. Often only the leaf nodes are drawn as nodes higher up in the hierarchy would obscure what is below. `geom_treemap` is a shorthand for `geom_node_treemap` as node is implicit in the case of treemap drawing.

Usage

```r
geom_node_tile(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

- **mapping**  
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x, y, width and height are mapped to x, y, width and height in the node data.

- **data**  
  The data to be displayed in this layer. There are three options:  
  - If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.  
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.  
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

- **position**  
  Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Aesthetics

geom_treemap understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

• x
• y
• width
• height
• alpha
• colour
• fill
• size
• stroke
• filter

Examples

# Create a graph of the flare class system
library(tidygraph)
flareGraph <- tbl_graph(flare$vertices, flare$edges) %>%
mutate(
  class = map_bfs_chr(node_is_root(), .f = function(node, dist, path, ...) {
    if (dist <= 1) {
      return(shortName[node])
    }
    path$result[[nrow(path)]]
  })
)
ggraph(flareGraph, 'treemap', weight = size) +
  geom_node_tile(aes(fill = class, filter = leaf, alpha = depth), colour = NA) +
This geom is equivalent in functionality to `ggforce::geom_voronoi_tile()` and allows for plotting of nodes as tiles from a voronoi tesselation. As with `ggforce::geom_voronoi_tile()` it is possible to restrict the size of the tile to a fixed radius, as well as round corners and expand/contract the tile.

### Usage

```r
geom_node_voronoi(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  bound = NULL,
  eps = 1e-09,
  max.radius = NULL,
  normalize = FALSE,
  asp.ratio = 1,
  expand = 0,
  radius = 0,
  ...
)
```

### Arguments

- **mapping**
  
  Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes()`. By default x and y are mapped to x and y in the node data and group set to -1.

- **data**
  
  The data to be displayed in this layer. There are three options:
  
  - If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a `formula` (e.g. `head(.x,10)`).

- **position**
  
  Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

bound: The bounding rectangle for the tesselation or a custom polygon to clip the tesselation to. Defaults to NULL which creates a rectangle expanded 10% in all directions. If supplied as a bounding box it should be a vector giving the bounds in the following order: xmin, xmax, ymin, ymax. If supplied as a polygon it should either be a 2-column matrix or a data.frame containing an x and y column.

eps: A value of epsilon used in testing whether a quantity is zero, mainly in the context of whether points are collinear. If anomalous errors arise, it is possible that these may averted by adjusting the value of eps upward or downward.

max.radius: The maximum distance a tile can extend from the point of origin. Will in effect clip each tile to a circle centered at the point with the given radius. If normalize = TRUE the radius will be given relative to the normalized values.

normalize: Should coordinates be normalized prior to calculations. If x and y are in wildly different ranges it can lead to tesselation and triangulation that seems off when plotted without ggplot2::coord_fixed(). Normalization of coordinates solves this. The coordinates are transformed back after calculations.

asp.ratio: If normalize = TRUE the x values will be multiplied by this amount after normalization.

expand: A numeric or unit vector of length one, specifying the expansion amount. Negative values will result in contraction instead. If the value is given as a numeric it will be understood as a proportion of the plot area width.

radius: As expand but specifying the corner radius.

...: Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

**Aesthetics**

geom_node_voronoi understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- x
- y
- alpha
- colour
- fill
- shape
- size
- stroke
- filter

Examples

```r
require(tidygraph)
gr <- create_notable('meredith') %>%
  mutate(group = sample(letters[1:4], n(), TRUE))

ggraph(gr) +
  geom_node_voronoi(aes(fill = group, colour = group), alpha = 0.3) +
  geom_edge_link(alpha = 0.3) +
  geom_node_point()

# Use max.radius to make the tesselation more "node"-like

ggraph(gr) +
  geom_node_voronoi(aes(fill = group, colour = group), alpha = 0.3, max.radius = 1) +
  geom_edge_link(alpha = 0.3) +
  geom_node_point()
```

Description

Connections within the ggraph terminology are links between nodes that are not part of the network structure itself. In that sense connections do not affect the layout calculation in any way and will not be drawn by the standard geom_edge_* functions. A connection does not need to only be defined by a start and end node, but can include intermediary nodes. get_con helps in creating connection data by letting you specify start and end nodes and automatically finds the shortest path within the graph structure that connects the given points. If this is not what is needed it is also possible to supply a list of vectors giving node indices that define a connection.

Usage

```r
get_con(
  from = integer(),
  to = integer(),
  paths = NULL,
  ..., 
  weight = NULL,
  mode = "all"
)`
get_edges

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from, to</td>
<td>The index of the start and end nodes for the connections</td>
</tr>
<tr>
<td>paths</td>
<td>A list of integer vectors giving the index of nodes defining connections</td>
</tr>
<tr>
<td>...</td>
<td>Additional information to be added to the final data output</td>
</tr>
<tr>
<td>weight</td>
<td>An expression to be evaluated on the edge data to provide weights for the shortest path calculations</td>
</tr>
<tr>
<td>mode</td>
<td>Character constant, gives whether the shortest paths to or from the given vertices should be calculated for directed graphs. If out then the shortest paths from the vertex, if in then to it will be considered. If all, the default, then the corresponding undirected graph will be used, i.e. not directed paths are searched. This argument is ignored for undirected graphs.</td>
</tr>
</tbody>
</table>

Value

A function that takes a layout_ggraph object and returns the given connections

See Also

Other extractors: get_edges(), get_nodes()

get_edges Create edge extractor function

Description

This function returns another function that can extract edges from a ggraph_layout object. The functionality of the returned function is decided by the arguments to get_edges. The need for get_edges is mainly to pass to the data argument of the different geom_edge_* functions in order to present them with the right kind of data. In general each geom_edge_* has the default set correctly so there is only need to modify the data argument if parallel edges should be collapsed.

Usage

get_edges(format = "short", collapse = "none", ...)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Either 'short' (the default) or 'long'. See details for a descriptions of the differences</td>
</tr>
<tr>
<td>collapse</td>
<td>Either 'none' (the default), 'all' or 'direction'. Specifies whether parallel edges should be merged. See details for more information</td>
</tr>
<tr>
<td>...</td>
<td>Additional data that will be cbind’ed together with the returned edge data.</td>
</tr>
</tbody>
</table>
Details

There are two types of return formats possible for the result of the returned function:

**short**  In this format each edge is described in one line in the format expected for `ggplot2::geom_segment()`, that is, the start node position is encoded in the x and y column and the end node position is encoded in the xend and yend column. If node parameters are added to the edge the name of the parameters will be prefixed with node1. for the start node and node2. for the end node.

**long**  In this format each edge consists of two rows with matching edge.id value. The start and end position are both encoded in the x and y column. The relative position of the rows determines which is the start and end node, the first occurring being the start node. If node parameters are added to the edge data the name of the parameters will be prefixed with node..

Node parameters are automatically added so it is possible to format edge aesthetics according to start or end node parameters, or interpolate edge aesthetics between start and end node parameters. Node parameters will be prefixed to avoid name clash with edge parameters. The prefix depends on the format (see above).

If the graph is not simple (it contains at most one edge between each node pair) it can be collapsed so either all edges between two nodes or all edges of the same direction between two nodes are merged. The edge parameters are taken from the first occurring edge, so if some more sophisticated summary is needed it is suggested that the graph be tidied up before plotting with ggraph.

Value

A data.frame with columns dependent on format as well as the graph type. In addition to the columns discussed in the details section, the data.frame will always contain the columns from, to and circular, the two former giving the indexes of the start and end node and the latter if the layout is circular (needed for correct formatting of some geom_edge_*). The graph dependent information is:

**dendrogram**  A label column will hold the value of the edgetext attribute. In addition any value stored in the edgePar attribute will be added. Lastly a direction column will hold the relative position between the start and end nodes (needed for correct formatting of `geom_edge_elbow()`).

**igraph**  All edge attributes of the original graph object is added as columns to the data.frame

See Also

Other extractors: `get_con()`, `get_nodes()`

---

**Description**

This function returns another function that can extract nodes from a ggraph_layout object. As a ggraph_layout object is essentially a data.frame of nodes it might seem useless to provide this function, but since the node data is not necessarily available until after the ggraph() call it can be beneficial to be able to add information to the node data on a per-layer basis. Unlike `get_edges()` the use of `get_nodes` is not mandatory and is only required if additional data should be added to selected node layers.
Usage
get_nodes(...)

Arguments
... Additional data that should be cbind'ed together with the node data.

Value
A data.frame with the node data as well of any additional data supplied through ... 

See Also
Other extractors: get_con(), get_edges() 

Description
This function is the equivalent of ggplot2::ggplot() in ggplot2. It takes care of setting up the plot object along with creating the layout for the plot based on the graph and the specification passed in. Alternatively a layout can be prepared in advance using create_layout and passed as the data argument. See Details for a description of all available layouts.

Usage
ggraph(graph, layout = "auto", ...)
create_layout(graph, layout, circular, ...)

## Default S3 method:
create_layout(graph, layout, ...

## S3 method for class 'layout_ggraph'
create_layout(graph, ...)

## S3 method for class 'tbl_graph'
create_layout(graph, layout, circular = FALSE, ...)

Arguments
graph The object containing the graph. See Details for a list of supported classes. Or a layout_ggraph object as returned from create_layout in which case all subsequent arguments is ignored.

layout The type of layout to create. Either a valid string, a function, a matrix, or a data.frame (see Details)
Arguments passed on to the layout function.

*circular* Should the layout be transformed into a radial representation. Only possible for some layouts. Defaults to `FALSE`.

**Details**

Following is a short description of the different layout types available in `ggraph`. Each layout is further described in its own help pages. Any type of regular graph/network data can be represented as a `tbl_graph` object. Because of this the different layouts that can be applied to `tbl_graph` objects are quite diverse, but not all layouts makes sense to all types of graphs. It is up to the user to understand their data and choose an appropriate layout. For standard node-edge diagrams igraph defines a long range of different layout functions that are all available through the `igraph` layout where the specific layout is specified using the `algorithm` argument. In order to minimize typing all igraph algorithms can also be passed directly into the layout argument.

Any object that has an appropriate `as_tbl_graph` method can be passed into `ggraph()` and will automatically be converted underneath.

*auto* The default layout. See `layout_tbl_graph_auto()` for further details.

*igraph* Use one of the internal igraph layout algorithms. The algorithm is specified using the `algorithm` argument. All strings accepted by the `algorithm` argument can also be supplied directly into `layout`. See `layout_tbl_graph_igraph()` for further details.

*dendrogram* Lays out the nodes in a tree-like graph as a dendrogram with leaves set at 0 and parents 1 unit above its tallest child. See `layout_tbl_graph_dendrogram()` for further details.

*manual* Lets the user manually specify the location of each node. See `layout_tbl_graph_manual()` for further details.

*linear* Arranges the nodes linearly or circularly in order to make an arc diagram. See `layout_tbl_graph_linear()` for further details.

*matrix* Arranges nodes on a diagonal thus preparing it for use with `geom_edge_point()` to make a matrix plot. See `layout_tbl_graph_matrix()` for further details.

*treemap* Creates a treemap from the graph, that is, a space-filing subdivision of rectangles showing a weighted hierarchy. See `layout_tbl_graph_treemap()` for further details.

*circlepack* Creates a layout showing a hierarchy as circles within circles. Conceptually equal to treemaps. See `layout_tbl_graph_circlepack()` for further details.

*partition* Creates icicle or sunburst charts, where each layer subdivides the division given by the preceding layer. See `layout_tbl_graph_partition()` for further details.

*hive* Positions nodes on axes spreading out from the center based on node attributes. See `layout_tbl_graph_hive()` for further details.

Alternatively a matrix or a data.frame can be provided to the layout argument. In the former case the first column will be used as x coordinates and the second column will by used as y coordinates, further columns are dropped. In the latter case the data.frame is used as the layout table and must thus contain a numeric x and y column.

Lastly a function can be provided to the layout argument. It will be called with the graph object as its first argument and any additional argument passed into `ggraph()`/`create_layout()`. The function must return either a data.frame or an object coercible to one and have an x and y column, or an object coercible to a `tbl_graph`. In the latter case the node data is extracted and used as layout (and must thus contain an x and y column) and the graph will be added as the graph attribute.
**Value**

For `ggraph()` an object of class gg onto which layers, scales, etc. can be added. For `create_layout()` an object inheriting from `layout_ggraph. layout_ggraph` itself inherits from `data.frame` and can be considered as such. The data.frame contains the node positions in the x and y column along with additional columns generated by the specific layout, as well as node parameters inherited from the graph. Additional information is stored as attributes to the data.frame. The original graph object is stored in the `graph` attribute and the `circular` attribute contains a logical indicating whether the layout has been transformed to a circular representation.

**See Also**

`get_edges()` for extracting edge information from the layout and `get_con()` for extracting path information.

**Examples**

```r
require(tidygraph)
gr <- create_notable("bull")
layout <- create_layout(gr, layout = "igraph", algorithm = "kk")
```

---

**Description**

This function is equivalent to `ggplot2::guide_colourbar()` but works for edge aesthetics.

**Usage**

```r
guide_edge_colourbar(
  title = waiver(),
  title.position = NULL,
  title.theme = NULL,
  title.hjust = NULL,
  title.vjust = NULL,
  label = TRUE,
  label.position = NULL,
  label.theme = NULL,
  label.hjust = NULL,
  label.vjust = NULL,
  barwidth = NULL,
  barheight = NULL,
  nbin = 20,
  raster = TRUE,
  ticks = TRUE,
  draw.ulim = TRUE,
  draw.llim = TRUE,
)```
direction = NULL,
default.unit = "line",
reverse = FALSE,
order = 0,
...
)

guide_edge_colorbar(
title = waiver(),
title.position = NULL,
title.theme = NULL,
title.hjust = NULL,
title.vjust = NULL,
label = TRUE,
label.position = NULL,
label.theme = NULL,
label.hjust = NULL,
label.vjust = NULL,
barwidth = NULL,
barheight = NULL,
nbin = 20,
raster = TRUE,
ticks = TRUE,
draw.ulim = TRUE,
draw.llim = TRUE,
direction = NULL,
default.unit = "line",
reverse = FALSE,
order = 0,
...
)

Arguments

title A character string or expression indicating a title of guide. If NULL, the title is not shown. By default (waiver()), the name of the scale object or the name specified in labs() is used for the title.

title.position A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."

title.theme A theme object for rendering the title text. Usually the object of element_text() is expected. By default, the theme is specified by legend.title in theme() or theme.

title.hjust A number specifying horizontal justification of the title text.

title.vjust A number specifying vertical justification of the title text.

label logical. If TRUE then the labels are drawn. If FALSE then the labels are invisible.

label.position A character string indicating the position of a label. One of "top", "bottom" (default for horizontal guide), "left", or "right" (default for vertical guide).
A theme object for rendering the label text. Usually the object of `element_text()` is expected. By default, the theme is specified by `legend.text` in `theme()`.  

A numeric specifying horizontal justification of the label text.  

A numeric specifying vertical justification of the label text.  

A numeric or a `grid::unit()` object specifying the width of the colourbar. Default value is `legend.key.width` or `legend.key.size` in `theme()` or theme.  

A numeric or a `grid::unit()` object specifying the height of the colourbar. Default value is `legend.key.height` or `legend.key.size` in `theme()` or theme.  

A numeric specifying the number of bins for drawing the colourbar. A smoother colourbar results from a larger value.  

A logical. If `TRUE` then the colourbar is rendered as a raster object. If `FALSE` then the colourbar is rendered as a set of rectangles. Note that not all graphics devices are capable of rendering raster image.  

A logical specifying if tick marks on the colourbar should be visible.  

A logical specifying if the upper limit tick marks should be visible.  

A logical specifying if the lower limit tick marks should be visible.  

A character string indicating the direction of the guide. One of "horizontal" or "vertical."  

A character string indicating `grid::unit()` for `barwidth` and `barheight`.  

A logical if `TRUE` the colourbar is reversed. By default, the highest value is on the top and the lowest value is on the bottom  

A positive integer less than 99 that specifies the order of this guide among multiple guides. This controls the order in which multiple guides are displayed, not the contents of the guide itself. If 0 (default), the order is determined by a secret algorithm.  

Ignored.  

A guide object  

---  

**guide_edge_direction**  

*Edge direction guide*  

**Description**  

This guide is intended to show the direction of edges based on the aesthetics mapped to its progression, such as changing width, colour and opacity.
Usage

guide_edge_direction(  
  title = waiver(),  
  title.position = NULL,  
  title.theme = NULL,  
  title.hjust = NULL,  
  title.vjust = NULL,  
  arrow = TRUE,  
  arrow.position = NULL,  
  barwidth = NULL,  
  barheight = NULL,  
  nbin = 500,  
  direction = NULL,  
  default.unit = "line",  
  reverse = FALSE,  
  order = 0,  
  override.aes = list(),  
  ...  
)

Arguments

title A character string or expression indicating a title of guide. If NULL, the title is not shown. By default (waiver()), the name of the scale object or the name specified in labs() is used for the title.

title.position A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."

title.theme A theme object for rendering the title text. Usually the object of element_text() is expected. By default, the theme is specified by legend.title in theme() or theme.

title.hjust A number specifying horizontal justification of the title text.

title.vjust A number specifying vertical justification of the title text.

arrow Logical. Should an arrow be drawn to illustrate the direction. Defaults to TRUE

arrow.position The position of the arrow relative to the example edge.

barwidth A numeric or a grid::unit() object specifying the width of the colourbar. Default value is legend.key.width or legend.key.size in theme() or theme.

barheight A numeric or a grid::unit() object specifying the height of the colourbar. Default value is legend.key.height or legend.key.size in theme() or theme.

nbin A numeric specifying the number of bins for drawing the colourbar. A smoother colourbar results from a larger value.

direction A character string indicating the direction of the guide. One of "horizontal" or "vertical."

default.unit A character string indicating grid::unit() for barwidth and barheight.

reverse logical. If TRUE the colourbar is reversed. By default, the highest value is on the top and the lowest value is on the bottom
order positive integer less than 99 that specifies the order of this guide among multiple guides. This controls the order in which multiple guides are displayed, not the contents of the guide itself. If 0 (default), the order is determined by a secret algorithm.

override.aes A list specifying aesthetic parameters of legend key.

... ignored.

Examples

```r
gr <- tidygraph::as_tbl_graph(highschool) gggraph(gr, layout = 'kk') + geom_edge_fan(aes(alpha = stat(index))) + guides(edge_alpha = guide_edge_direction())```

**Description**

This dataset shows the friendship among high school boys as assessed by the question: "What fellows here in school do you go around with most often?". The question was posed twice, with one year in between (1957 and 1958) and shows the evolution in friendship between the two timepoints.

**Usage**

```r
highschool```

**Format**

The graph is stored as an unnamed edgelist with a year attribute.

- **from** The boy answering the question
- **to** The boy being the answer to the question
- **year** The year the friendship was reported

**Source**

layout_tbl_graph_auto  

Automatically pick a layout based on graph type

Description

This function infers the layout from the graph structure and is the default when calling `ggraph()`. If an x and y argument is passed along, the manual layout is chosen. Otherwise if the graph is either a rooted tree or a rooted forest the layout will be dendrogram if the nodes contains a height variable or tree if not. If the tree is unrooted the unrooted layout will be used. If the tree is a DAG the sygiyama layout will be used. Otherwise the stress layout will be used (or sparse_tree if the graph contains more than 2000 nodes).

Usage

```
layout_tbl_graph_auto(graph, circular, ...)
```

Arguments

- `graph`: A tbl_graph object
- `circular`: Logical. Should the layout be transformed to a circular representation. Defaults to `FALSE`. Only applicable if the graph is a tree structure
- `...`: Arguments passed on to the chosen layout

Value

A data.frame with the columns x, y, circular as well as any information stored as node variables in the tbl_graph object.

Section layout_tbl_graph

**Description**

This layout is optimised for drawing small-world types of graphs often found in social networks, where distinct groups are still highly connected to the remaining graph. Typical layouts struggle with this as they attempt to minimise the edge length of all edges equally. The backbone layout is based on weighing edges based on how well they hold together communities. The end result is that communities tend to stick together despite high interconnectivity.
### Usage

```r
layout_tbl_graph_backbone(graph, keep = 0.2, circular = FALSE)
```

### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>graph</code></td>
<td>A tbl_graph object</td>
</tr>
<tr>
<td><code>keep</code></td>
<td>The fraction of edges to use for creating the backbone</td>
</tr>
<tr>
<td><code>circular</code></td>
<td>ignored</td>
</tr>
</tbody>
</table>

### Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the tbl_graph object. Further an edge attribute called `backbone` is added giving whether the edge was selected as backbone.

### Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

### References

### See Also

---

### Description

This layout places nodes in circles with the radii relative to a given centrality measure. Under the hood it use stress majorisation to place nodes optimally given the radius constraint.
Usage

```r
layout_tbl_graph_centrality(
  graph,
  centrality,
  scale = TRUE,
  niter = 500,
  tolerance = 1e-04,
  tseq = seq(0, 1, 0.2),
  circular = FALSE
)
```

Arguments

- **graph**: A `tbl_graph` object
- **centrality**: An expression evaluating to a centrality measure for the nodes. See the different `centrality_*()` algorithms in tidygraph for a selection.
- **scale**: Should the centrality measure be scaled between 0 and 100
- **niter**: number of iterations during stress optimization
- **tolerance**: stopping criterion for stress optimization
- **tseq**: Transitioning steps
- **circular**: ignored

Value

A data.frame with the columns `x`, `y`, `circular`, `centrality` as well as any information stored as node variables in the `tbl_graph` object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

References

See Also

Other `layout_tbl_graph_*`: `layout_tbl_graph_auto()`, `layout_tbl_graph_backbone()`, `layout_tbl_graph_circlepack()`, `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_eigen()`, `layout_tbl_graph_fabric()`, `layout_tbl_graph_focus()`, `layout_tbl_graph_hive()`, `layout_tbl_graph_igraph()`, `layout_tbl_graph_linear()`, `layout_tbl_graph_manual()`, `layout_tbl_graph_matrix()`, `layout_tbl_graph_partition()`, `layout_tbl_graph_pmds()`, `layout_tbl_graph_stress()`, `layout_tbl_graph_treemap()`, `layout_tbl_graph_unroot()`
Description

The circle packing algorithm is basically a treemap using circles instead of rectangles. Due to the nature of circles they cannot be packed as efficiently leading to increased amount of "empty space" as compared to a treemap. This can be beneficial though, as the added empty space can aid in visually showing the hierarchy.

Usage

```r
layout_tbl_graph_circlepack(
  graph,
  weight = NULL,
  circular = FALSE,
  sort.by = NULL,
  direction = "out"
)
```

Arguments

- `graph` An tbl_graph object
- `weight` An optional node variable to use as weight. Will only affect the weight of leaf nodes as the weight of non-leaf nodes are derived from their children.
- `circular` Logical. Should the layout be transformed to a circular representation. Ignored.
- `sort.by` The name of a node variable to sort the nodes by.
- `direction` The direction of the tree in the graph. 'out' (default) means that parents point towards their children, while 'in' means that children point towards their parent.

Details

The circle packing is based on the algorithm developed by Weixin Wang and collaborators which tries to find the most dense packing of circles as they are added, one by one. This makes the algorithm very dependent on the order in which circles are added and it is possible that layouts could sometimes be optimized by choosing a different ordering. The algorithm for finding the enclosing circle is the randomized incremental algorithm proposed by Emo Welzl. Both of the above algorithms are the same as used in the D3.js implementation of circle packing and their C++ implementation in ggraph is inspired by Mike Bostocks JavaScript implementation.

Value

A data.frame with the columns `x`, `y`, `r`, `leaf`, `depth`, `circular` as well as any information stored as node variables in the tbl_graph object.
Note

Circle packing is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

layout_tbl_graph_dendrogram

Apply a dendrogram layout to layout_tbl_graph

Description

This layout mimics the igraph::layout_as_tree() algorithm supplied by igraph, but puts all leaves at 0 and builds it up from there, instead of starting from the root and building it from there. The height of branch points are related to the maximum distance to an edge from the branch node, or read from a node variable.

Usage

```r
layout_tbl_graph_dendrogram(
  graph,
  circular = FALSE,
  offset = pi/2,
  height = NULL,
  length = NULL,
  repel = FALSE,
  ratio = 1,
  direction = "out"
)
```
**Arguments**

- **graph**  
  A `tbl_graph` object

- **circular**  
  Logical. Should the layout be transformed to a circular representation. Defaults to `FALSE`.

- **offset**  
  If `circular = TRUE`, where should it begin. Defaults to `pi/2` which is equivalent to 12 o’clock.

- **height**  
  The node variable holding the height of each node in the dendrogram. If `NULL` it will be calculated as the maximal distance to a leaf.

- **length**  
  An edge parameter giving the length of each edge. The node height will be calculated from the maximal length to the root node (ignored if `height` does not evaluate to `NULL`).

- **repel**  
  Should leaves repel each other relative to the height of their common ancestor. Will emphasize clusters.

- **ratio**  
  The strength of repulsion if `repel = TRUE`. Higher values will give more defined clusters.

- **direction**  
  The direction to the leaves. Defaults to 'out'

**Value**

A data.frame with the columns `x`, `y`, `circular`, `depth` and `leaf` as well as any information stored as node variables on the `tbl_graph`

**Note**

This function is not intended to be used directly but by setting `layout = 'dendrogram'` in `create_layout()`

**See Also**

---

**layout_tbl_graph_eigen**

*Place nodes according to their eigenvalues*

---

**Description**

This layout is based on the idea of spectral layouts where node coordinates are calculated directly by decomposing a matrix representation of the graph and extracting the eigenvectors.
Usage

```r
layout_tbl_graph_eigen(
  graph,
  type = "laplacian",
  eigenvector = "smallest",
  circular = FALSE
)
```

Arguments

- `graph` A tbl_graph object
- `type` The type of matrix to extract the eigenvectors from. Either 'laplacian' or 'adjacency'
- `eigenvector` The eigenvector to use for coordinates. Either 'smallest' or 'largest'
- `circular` ignored

Value

A data.frame with the columns \( x \), \( y \), \( \text{circular} \) as well as any information stored as node variables in the tbl_graph object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

See Also

Other layout_tbl_graph_*: `layout_tbl_graph_auto()`, `layout_tbl_graph_backbone()`, `layout_tbl_graph_centrality()`, `layout_tbl_graph_circlepack()`, `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_fabric()`, `layout_tbl_graph_focus()`, `layout_tbl_graph_hive()`, `layout_tbl_graph_igraph()`, `layout_tbl_graph_linear()`, `layout_tbl_graph_manual()`, `layout_tbl_graph_matrix()`, `layout_tbl_graph_partition()`, `layout_tbl_graph_pmds()`, `layout_tbl_graph_stress()`, `layout_tbl_graph_treemap()`, `layout_tbl_graph_unrooted()`

---

**layout_tbl_graph_fabric**

*Create a fabric layout*

---

Description

This layout is a bit unusual in that it shows nodes as horizontal line ranges end edges as evenly spaced vertical spans connecting the nodes. As with the matrix layout the strength comes from better scalability but its use require some experience recognising the patterns that different connectivity features gives rise to. As with matrix layouts the ordering of nodes have huge power over the look of the plot. The `node_rank_fabric()` mimics the default ordering from the original BioFabric implementation, but other ranking algorithms from tidygraph can be used with the `sort.by` argument as well. Fabric layouts tend to become quite wide as the graph grows which is something that should be handled with care - e.g. by only zooming in on a specific region.
layout_tbl_graph_fabric

Usage

layout_tbl_graph_fabric(
  graph,
  circular = FALSE,
  sort.by = NULL,
  shadow.edges = FALSE
)
	node_rank_fabric()

Arguments

graph An tbl_graph object
circular Ignored
sort.by An expression providing the sorting of the nodes. If NULL the nodes will be ordered by their index in the graph.
shadow.edges Should shadow edges be shown.

Value

A data.frame with the columns x, xmin, xmax, y, circular as well as any information stored as node variables in the tbl_graph object. Further, the edges of the graph will gain a edge_x variable giving the horizontal position of the edge as well as a shadow_edge variable denoting whether the edge is a shadow edge added by the layout.

layout_tbl_graph_focus

Place nodes in circles based on distance to a specific node

Description

This layout constrains node placement to a radius relative to its distance to a given node. It then uses stress majorisation to find an optimal node distribution according to this constraint.

Usage

```r
layout_tbl_graph_focus(
  graph,
  focus,
  weights = NULL,
  niter = 500,
  tolerance = 1e-04,
  circular = TRUE
)
```

Arguments

- **graph**: a tbl_graph object
- **focus**: An expression evaluating to a selected node. Can either be a single integer or a logical vector with a single TRUE element.
- **weights**: An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
- **niter**: number of iterations during stress optimization
- **tolerance**: stopping criterion for stress optimization
- **circular**: ignored

Value

A data.frame with the columns x, y, circular, distance as well as any information stored as node variables in the tbl_graph object.

**layout_tbl_graph_hive**  Place nodes in a Hive Plot layout

### Description

Hive plots were invented by Martin Krzywinski as a perceptually uniform and scalable alternative to standard node-edge layouts. In hive plots nodes are positioned on axes radiating out from a center based on their own information e.g. membership of a class, size of neighborhood, etc. Edges are then drawn between nodes as bezier curves. As the placement of nodes is not governed by convoluted algorithms but directly reflects the qualities of the nodes itself the resulting plot can be easier to interpret as well as compare to other graphs.

### Usage

```r
layout_tbl_graph_hive(
  graph, 
  axis, 
  axis.pos = NULL, 
  sort.by = NULL, 
  divide.by = NULL, 
  divide.order = NULL, 
  normalize = TRUE, 
  center.size = 0.1, 
  divide.size = 0.05, 
  use.numeric = FALSE, 
  offset = pi/2, 
  split.axes = "none", 
  split.angle = pi/6, 
  circular = FALSE
)
```

### Arguments

- **graph**: An tbl_graph object
- **axis**: The node attribute to use for assigning nodes to axes
- **axis.pos**: The relative distance to the prior axis. Default (NULL) places axes equidistant.
- **sort.by**: The node attribute to use for placing nodes along their axis. Defaults (NULL) places nodes sequentially.
divide.by  An optional node attribute to subdivide each axis by.
divide.order The order the axis subdivisions should appear in
normalize Logical. Should axis lengths be equal or reflect the number of nodes in each axis. Defaults to TRUE.
center.size The size of the blank center, that is, the start position of the axes.
divide.size The distance between subdivided axis segments.
use.numeric Logical, If the sort.by attribute is numeric, should these values be used directly in positioning the nodes along the axes. Defaults to FALSE which sorts the numeric values and positions them equidistant from each other.
offset Change the overall rotation of the hive plot by changing the offset of the first axis.
split.axes Should axes be split to show edges between nodes on the same axis? One of: ‘none’ Do not split axes and show in-between edges ‘loops’ Only split axes that contain in-between edges ‘all’ Split all axes
split.angle The angular distance between the two axes resulting from a split.
circular The angular distance between the two axes resulting from a split.

Details

In order to be able to draw all edges without edges crossing axes you should not assign nodes to axes based on a variable with more than three levels.

Value

A data.frame with the columns x, y, r, center.size, split, axis, section, angle, circular as well as any information stored as node variables in the tbl_graph object.

Other layout_tbl_graph_*: layout_tbl_graph_auto(), layout_tbl_graph_backbone(), layout_tbl_graph_centrality(), layout_tbl_graph_circlepack(), layout_tbl_graph_dendrogram(), layout_tbl_graph_eigen(), layout_tbl_graph_fabric(), layout_tbl_graph_focus(), layout_tbl_graph_igraph(), layout_tbl_graph_linear(), layout_tbl_graph_manual(), layout_tbl_graph_matrix(), layout_tbl_graph_partition(), layout_tbl_graph_pmds(), layout_tbl_graph_stress(), layout_tbl_graph_treemap(), layout_tbl_graph_unrooted()
Description
This layout function makes it easy to apply one of the layout algorithms supplied in igraph when plotting with ggraph. Layout names are auto completed so there is no need to write layout_with_graphopt or layout_as_tree, just graphopt and tree (though the former will also work if you want to be super explicit). Circular layout is only supported for tree-like layout (tree and sugiyama) and will throw an error when applied to other layouts.

Usage
layout_tbl_graph_igraph(
  graph,
  algorithm,
  circular,
  offset = pi/2,
  use dummy = FALSE,
  ...
)

Arguments
  graph: A tbl_graph object.
  algorithm: The type of layout algorithm to apply. See Details or igraph::layout_() for links to the layouts supplied by igraph.
  circular: Logical. Should the layout be transformed to a circular representation. Defaults to FALSE. Only applicable to algorithm = 'tree' and algorithm = 'sugiyama'.
  offset: If circular = TRUE, where should it begin. Defaults to pi/2 which is equivalent to 12 o’clock.
  use dummy: Logical. In the case of algorithm = 'sugiyama' should the dummy-infused graph be used rather than the original. Defaults to FALSE.
  ...: Arguments passed on to the respective layout functions

Details
igraph provides a huge amount of possible layouts. They are all briefly described below:

Hierarchical layouts

  tree: Uses the Reingold-Tilford algorithm to place the nodes below their parent with the parent centered above its children. See igraph::as_tree()

  sugiyama: Designed for directed acyclic graphs (that is, hierarchies where multiple parents are allowed) it minimizes the number of crossing edges. See igraph::with_sugiyama()
Standard layouts

bipartite Minimize edge-crossings in a simple two-row (or column) layout for bipartite graphs. See `igraph::as_bipartite()`

star Place one node in the center and the rest equidistantly around it. See `igraph::as_star()`

circle Place nodes in a circle in the order of their index. Consider using `layout_tbl_graph_linear()` with circular=TRUE for more control. See `igraph::in_circle()`

nicely Tries to pick an appropriate layout. See `igraph::nicely()` for a description of the simple decision tree it uses
dh Uses Davidson and Harels simulated annealing algorithm to place nodes. See `igraph::with_dh()`
gem Place nodes on the plane using the GEM force-directed layout algorithm. See `igraph::with_gem()`
graphopt Uses the Graphopt algorithm based on alternating attraction and repulsion to place nodes. See `igraph::with_graphopt()`
grid Place nodes on a rectangular grid. See `igraph::on_grid()`
mds Perform a multidimensional scaling of nodes using either the shortest path or a user supplied distance. See `igraph::with_mds()`
sphere Place nodes uniformly on a sphere - less relevant for 2D visualizations of networks. See `igraph::on_sphere()`
randomly Places nodes uniformly random. See `igraph::randomly()`
fr Places nodes according to the force-directed algorithm of Fruchterman and Reingold. See `igraph::with_fr()`

Value

A data.frame with the columns x, y, circular as well as any information stored as node variables in the tbl_graph object.

Note

This function is not intended to be used directly but by setting layout = 'igraph' in `create_layout()`

**layout_tbl_graph_linear**

*Place nodes on a line or circle*

**Description**

This layout puts all nodes on a line, possibly sorted by a node attribute. If `circular = TRUE` the nodes will be laid out on the unit circle instead. In the case where the `sort.by` attribute is numeric, the numeric values will be used as the x-position and it is thus possible to have uneven spacing between the nodes.

**Usage**

```r
layout_tbl_graph_linear(
  graph,
  circular,
  sort.by = NULL,
  use.numeric = FALSE,
  offset = pi/2
)
```

**Arguments**

- `graph` An `tbl_graph` object
- `circular` Logical. Should the layout be transformed to a circular representation. Defaults to `FALSE`.
- `sort.by` The name of a node variable to sort the nodes by.
- `use.numeric` Logical. Should a numeric `sort.by` attribute be used as the actual x-coordinates in the layout. May lead to overlapping nodes. Defaults to `FALSE`.
- `offset` If `circular = TRUE`, where should it begin. Defaults to `pi/2` which is equivalent to 12 o’clock.

**Value**

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

**See Also**

- `layout_tbl_graph_stress`
- `layout_tbl_graph_treemap`
- `layout_tbl_graph_unrooted`
Manually specify a layout for \texttt{layout_tbl_graph}

**Description**

This layout function lets you pass the node positions in manually. The supplied positions must match the order of the nodes in the \texttt{tbl_graph}.

**Usage**

\begin{verbatim}
layout_tbl_graph_manual(graph, x, y, circular)
\end{verbatim}

**Arguments**

- \texttt{graph}: An \texttt{tbl_graph} object
- \texttt{x}, \texttt{y}: Expressions with the x and y positions of the nodes
- \texttt{circular}: Ignored

**Value**

A data.frame with the columns x, y, circular as well as any information stored as node variables in the \texttt{tbl_graph}.

**See Also**

Other \texttt{layout_tbl_graph}\_*: \texttt{layout_tbl_graph_auto()}, \texttt{layout_tbl_graph_backbone()}, \texttt{layout_tbl_graph_centralit()}\
\texttt{layout_tbl_graph_circlepack()}, \texttt{layout_tbl_graph_dendrogram()}, \texttt{layout_tbl_graph_eigen()}, \texttt{layout_tbl_graph_fabric()}, \texttt{layout_tbl_graph_focus()}, \texttt{layout_tbl_graph_hive()}, \texttt{layout_tbl_graph_igraph()}, \texttt{layout_tbl_graph_linear()}, \texttt{layout_tbl_graph_matrix()}, \texttt{layout_tbl_graph_partition()}, \texttt{layout_tbl_graph_pmds()}, \texttt{layout_tbl_graph_stress()}, \texttt{layout_tbl_graph_treemap()}, \texttt{layout_tbl_graph_unroot()}

**Place nodes on a diagonal**

**Description**

This layout puts all nodes on a diagonal, thus preparing the layout for use with \texttt{geom_edge_point()} resulting in a matrix layout. While matrix layouts excel in scalability, the interpretation of the visual is very dependent on the sorting of the nodes. Different sorting algorithms have been implemented in \texttt{tidygraph} and these can be used directly. Behrisch \textit{et al.} (2016) have provided a nice overview of some of the different sorting algorithms and what insight they might bring, along with a rundown of different patterns to look out for.
Usage

```r
layout_tbl_graph_partition(graph, circular = FALSE, sort.by = NULL)
```

Arguments

- `graph`: An `tbl_graph` object
- `circular`: Ignored
- `sort.by`: An expression providing the sorting of the nodes. If `NULL` the nodes will be ordered by their index in the graph.

Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

References

See Also

Other `layout_tbl_graph_*`: `layout_tbl_graph_auto()`, `layout_tbl_graph_backbone()`, `layout_tbl_graph_centrality()`, `layout_tbl_graph_circlepack()`, `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_eigen()`, `layout_tbl_graph_fabric()`, `layout_tbl_graph_focus()`, `layout_tbl_graph_hive()`, `layout_tbl_graph_igraph()`, `layout_tbl_graph_linear()`, `layout_tbl_graph_manual()`, `layout_tbl_graph_partition()`, `layout_tbl_graph_pmds()`, `layout_tbl_graph_stress()`, `layout_tbl_graph_treemap()`, `layout_tbl_graph_unrooted()`

Description

The partition layout is a way to show hierarchical data in the same way as `layout_tbl_graph_treemap()`. Instead of subdividing the parent area the partition layout shows the division of a nodes children next to the area of the node itself. As such the node positions will be very reminiscent of a reingold-tilford tree layout but by plotting nodes as areas it better communicate the total weight of a node by summing up all its children. Often partition layouts are called icicle plots or sunburst diagrams (in case a radial transform is applied).
layout_tbl_graph_partition

Usage

```
layout_tbl_graph_partition(
    graph,
    weight = NULL,
    circular = FALSE,
    height = NULL,
    sort.by = NULL,
    direction = "out",
    offset = pi/2,
    const.area = TRUE
)
```

Arguments

- **graph**: An `tbl_graph` object
- **weight**: An optional node variable to use as weight. Will only affect the weight of leaf nodes as the weight of non-leaf nodes are derived from their children.
- **circular**: Logical. Should the layout be transformed to a circular representation. If `TRUE` the resulting layout will be a sunburst diagram.
- **height**: An optional node variable to use as height. If `NULL` all nodes will be given a height of 1.
- **sort.by**: The name of a node variable to sort the nodes by.
- **direction**: The direction of the tree in the graph. ‘out’ (default) means that parents point towards their children, while ‘in’ means that children point towards their parent.
- **offset**: If `circular = TRUE`, where should it begin. Defaults to `pi/2` which is equivalent to 12 o’clock.
- **const.area**: Logical. Should ‘height’ be scaled for area proportionality when using `circular = TRUE`. Defaults to `TRUE`.

Value

If `circular = FALSE` A data.frame with the columns `x`, `y`, `width`, `height`, `leaf`, `depth`, `circular` as well as any information stored as node variables in the tbl_graph object. If `circular = TRUE` A data.frame with the columns `x`, `y`, `r0`, `r`, `start`, `end`, `leaf`, `depth`, `circular` as well as any information stored as node variables in the tbl_graph object.

Note

partition is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

References

**layout_tbl_graph_pmds**

Place nodes based on a multidimensional scaling of a set of pivot nodes

---

**Description**

This layout is similar to the 'mds' layout but uses only a subset of pivot nodes for the mds calculation, making it considerably faster and thus suited for large graphs

**Usage**

```r
layout_tbl_graph_pmds(graph, pivots, weights = NULL, circular = FALSE)
```

**Arguments**

- **graph**
  - A tbl_graph object
- **pivots**
  - The number of pivot nodes
- **weights**
  - An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
- **circular**
  - ignored

**Value**

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the tbl_graph object.

**Author(s)**

The underlying algorithm is implemented in the graphlayouts package by David Schoch

layout_tbl_graph_circlepack(), layout_tbl_graph_dendrogram(), layout_tbl_graph_eigen(),
layout_tbl_graph_fabric(), layout_tbl_graph_focus(), layout_tbl_graph_hive(), layout_tbl_graph_igraph(),
layout_tbl_graph_linear(), layout_tbl_graph_manual(), layout_tbl_graph_matrix(), layout_tbl_graph_partition(),
layout_tbl_graph_stress(), layout_tbl_graph_treemap(), layout_tbl_graph_unrooted()

layout_tbl_graph_stress

*Place nodes using stress majorisation*

Description

This layout is related to the stress-minimization algorithm known as Kamada-Kawai (available as the 'kk' layout), but uses another optimization strategy. It generally have better runtime, quality, and stability compared to the Kamada-Kawai layout and is thus generally preferred. The sparse version of the layout have better performance (especially on larger networks) at the expense of layout quality, but will generally outperform many other algorithms for large graphs in both runtime and quality (e.g. the 'drl' layout from igraph).

Usage

```r
layout_tbl_graph_stress(
  graph, 
  weights = NULL, 
  niter = 500, 
  tolerance = 1e-04, 
  mds = TRUE, 
  bbox = 50, 
  circular = FALSE
)
```

```r
layout_tbl_graph_sparse_stress(
  graph, 
  pivots, 
  weights = NULL, 
  niter = 500, 
  circular = FALSE
)
```

Arguments

- **graph**: a tbl_graph object
- **weights**: An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
- **niter**: number of iterations during stress optimization
tolerance stopping criterion for stress optimization

mds should an MDS layout be used as initial layout (default: TRUE)

bbox constrain dimension of output. Only relevant to determine the placement of disconnected graphs.

circular ignored

pivots The number of pivot nodes.

Value

A data.frame with the columns \textit{x}, \textit{y}, \textit{circular} as well as any information stored as node variables in the tbl_graph object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch.

layout_tbl_graph_treemap

\textit{Calculate nodes as rectangles subdividing that of their parent}

Description

A treemap is a space filling hierarchical layout that maps nodes to rectangles. The rectangles of the children of a node is packed into the rectangle of the node so that the size of a rectangle is a function of the size of the children. The size of the leaf nodes can be mapped arbitrarily (defaults to 1). Many different algorithms exists for dividing a rectangle into smaller bits, some optimizing the aspect ratio and some focusing on the ordering of the rectangles. See details for more discussions on this. The treemap layout was first developed by Ben Shneiderman for visualizing disk usage in the early ’90 and has seen many improvements since.
layout_tbl_graph_treemap

Usage

layout_tbl_graph_treemap(
  graph,
  algorithm = "split",
  weight = NULL,
  circular = FALSE,
  sort.by = NULL,
  direction = "out",
  height = 1,
  width = 1
)

Arguments

graph A tbl_graph object
algorithm The name of the tiling algorithm to use. Defaults to ‘split’
weight An optional node variable to use as weight. Will only affect the weight of leaf
        nodes as the weight of non-leaf nodes are derived from their children.
circular Logical. Should the layout be transformed to a circular representation. Ignored.
sort.by The name of a node variables to sort the nodes by.
direction The direction of the tree in the graph. ‘out’ (default) means that parents point
towards their children, while ‘in’ means that children point towards their par-
ent.
height The height of the bounding rectangle
width The width of the bounding rectangle

Details

Different approaches to dividing the rectangles in a treemap exists; all with their strengths and
weaknesses. Currently only the split algorithm is implemented which strikes a good balance be-
tween aspect ratio and order preservation, but other, more well-known, algorithms such as squarify
and slice-and-dice will eventually be implemented.

Algorithms

Split (default)
The Split algorithm was developed by Bjorn Engdahl in order to address the downsides of both the
original slice-and-dice algorithm (poor aspect ratio) and the popular squarify algorithm (no ordering
of nodes). It works by finding the best cut in the ordered list of children in terms of making sure
that the two rectangles associated with the split will have optimal aspect ratio.

Value

A data.frame with the columns x, y, width, height, leaf, depth, circular as well as any infor-
mation stored as node variables in the tbl_graph object.
Note

Treemap is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

layout_tbl_graph_unrooted

Create an unrooted layout using equal-angle or equal-daylight

Description

When drawing unrooted trees the standard dendrogram layout is a bad fit as it implicitly creates a visual root node. Instead it is possible to spread the leafs out on the plane without putting any special emphasis on a particular node using an unrooted layout. The standard algorithm is the equal angle algorithm, but it can struggle with optimising the leaf distribution for large trees trees with very uneven branch length. The equal daylight algorithm modifies the output of the equal angle algorithm to better disperse the leaves, at the cost of higher computational cost and the possibility of edge crossings for very large unbalanced trees. For standard sized trees the daylight algorithm is far superior and not too heavy so it is the default.

Usage

```r
layout_tbl_graph_unrooted(
  graph,
  daylight = TRUE,
  length = NULL,
  tolerance = 0.05,
  rotation_mod = 1,
  maxiter = 100,
  circular = FALSE
)
```

---

**layout_tbl_graph_unrooted**

Create an unrooted layout using equal-angle or equal-daylight

Description

When drawing unrooted trees the standard dendrogram layout is a bad fit as it implicitly creates a visual root node. Instead it is possible to spread the leafs out on the plane without putting any special emphasis on a particular node using an unrooted layout. The standard algorithm is the equal angle algorithm, but it can struggle with optimising the leaf distribution for large trees trees with very uneven branch length. The equal daylight algorithm modifies the output of the equal angle algorithm to better disperse the leaves, at the cost of higher computational cost and the possibility of edge crossings for very large unbalanced trees. For standard sized trees the daylight algorithm is far superior and not too heavy so it is the default.

Usage

```r
layout_tbl_graph_unrooted(
  graph,
  daylight = TRUE,
  length = NULL,
  tolerance = 0.05,
  rotation_mod = 1,
  maxiter = 100,
  circular = FALSE
)
```
Arguments

- **graph**: A tbl_graph object
- **daylight**: Should equal-daylight adjustments be made
- **length**: An expression evaluating to the branch length of each edge
- **tolerance**: The threshold for mean angular adjustment before terminating the daylight adjustment
- **rotation_mod**: A modifier for the angular adjustment of each branch. Set it below 1 to let the daylight adjustment progress more slowly
- **maxiter**: The maximum number of iterations in the daylight adjustment
- **circular**: ignored

Value

A data.frame with the columns `x`, `y`, `circular`, `leaf` as well as any information stored as node variables in the tbl_graph object.

Note

Unrooted is a layout intended for undirected trees, that is, graphs with no cycles. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

node_angle

*Get the angle of nodes and edges*

Description

These helper functions make it easy to calculate the angle associated with nodes and edges. For nodes the angle is defined as the angle of the vector pointing towards the node position, and is thus mainly suited for circular layouts where it can be used to calculate the angle of labels. For edges it is simply the angle of the vector describing the edge.
Usage

node_angle(x, y, degrees = TRUE)

edge_angle(x, y, xend, yend, degrees = TRUE)

Arguments

x, y  A vector of positions

degrees  Logical. Should the angle be returned in degree (TRUE) or radians (FALSE). Defaults to TRUE.

xend, yend  The end position of the edge

Value

A vector with the angle of each node/edge

Examples

require(tidygraph)
flareGraph <- tbl_graph(flare$vertices, flare$edges)

ggraph(flareGraph, 'dendrogram', circular = TRUE) +
  geom_edge_diagonal0() +
  geom_node_text(aes(filter = leaf, angle = node_angle(x, y), label = shortName),
    hjust = 'outward', size = 2)
  expand_limits(x = c(-1.3, 1.3), y = c(-1.3, 1.3))

pack_circles  Pack circles together

Description

This function is a direct interface to the circle packing algorithm used by `layout_tbl_graph_circlepack`. It takes a vector of sizes and returns the x and y position of each circle as a two-column matrix.

Usage

pack_circles(areas)

Arguments

areas  A vector of circle areas
Value

A matrix with two columns and the same number of rows as the length of the "areas" vector. The matrix has the following attributes added: "enclosing_radius" giving the radius of the smallest enclosing circle, and "front_chain" giving the terminating members of the front chain (see Wang et al. 2006).

References

Examples

library(ggforce)
sizes <- sample(10, 100, TRUE)

position <- pack_circles(sizes)
data <- data.frame(x = position[,1], y = position[,2], r = sqrt(sizes/pi))

ggplot() +
  geom_circle(aes(x0 = x, y0 = y, r = r), data = data, fill = "steelblue") +
  geom_circle(aes(x0 = 0, y0 = 0, r = attr(position, "enclosing_radius"))) +
  geom_polygon(aes(x = x, y = y),
              data = data[attr(position, "front_chain"), ],
              fill = NA,
              colour = "black")

scale_edge_alpha

Edge alpha scales

Description

This set of scales defines new alpha scales for edge geoms equivalent to the ones already defined by ggplot2. See ggplot2::scale_alpha() for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_alpha in the call to the geom - just use alpha.

Usage

scale_edge_alpha(..., range = c(0.1, 1))
scale_edge_alpha_continuous(..., range = c(0.1, 1))
scale_edge_alpha_discrete(..., range = c(0.1, 1))
scale_edge_alpha_manual(..., values)
scale_edge_alpha_identity(..., guide = "none")
Arguments

... Other arguments passed on to `continuous_scale()`, `binned_scale()`, or `discrete_scale()` as appropriate, to control name, limits, breaks, labels and so forth.

range Output range of alpha values. Must lie between 0 and 1.

values a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given `na.value`.

guide Guide to use for this scale. Defaults to "none".

Value

A ggproto object inheriting from Scale

See Also

Other `scale_edge_*`: `scale_edge_colour`, `scale_edge_fill`, `scale_edge_linetype()`, `scale_edge_shape()`, `scale_edge_size()`, `scale_edge_width()`, `scale_label_size()`

scale_edge_colour

Edge colour scales

Description

This set of scales defines new colour scales for edge geoms equivalent to the ones already defined by ggplot2. The parameters are equivalent to the ones from ggplot2 so there is nothing new under the sun. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write `edge_colour` in the call to the geom - just use `colour`.

Usage

```r
scale_edge_colour_hue(
  ..., 
  h = c(0, 360) + 15, 
  c = 100, 
  l = 65, 
  h.start = 0, 
  direction = 1, 
  na.value = "grey50"
)

scale_edge_colour_brewer(..., type = "seq", palette = 1, direction = 1)

scale_edge_colour_distiller(
  ...,

    colours,
    values = NULL,
    space = "Lab",
    na.value = "grey50",
    guide = "edge_colourbar",
    colors
)

scale_edge_color_grey(..., start = 0.2, end = 0.8, na.value = "red")

scale_edge_color_identity(..., guide = "none")

scale_edge_color_manual(..., values)

scale_edge_color_continuous(
    ..., 
    low = "#132B43",
    high = "#56B1F7",
    space = "Lab",
    na.value = "grey50",
    guide = "edge_colourbar"
)

scale_edge_color_discrete(
    ..., 
    h = c(0, 360) + 15,
scale_edge_colour

c = 100,
l = 65,
h.start = 0,
direction = 1,
na.value = "grey50"
)

scale_edge_color_viridis(
  ...,  
alpaha = 1,
  begin = 0,
  end = 1,
  discrete = FALSE,
  option = "D",
  direction = 1
)

Arguments

Arguments passed on to discrete_scale

palette A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., scales::hue_pal()).

breaks One of:
  • NULL for no breaks
  • waiver() for the default breaks (the scale limits)
  • A character vector of breaks
  • A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

drop Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

scale_name The name of the scale that should be used for error messages associated with this scale.

name The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

labels One of:
  • NULL for no labels
  • waiver() for the default labels computed by the transformation object
  • A character vector giving labels (must be same length as breaks)
  • A function that takes the breaks as input and returns labels as output
For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function `expansion()` to generate the values for the `expand` argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.

**guide** A function used to create a guide or its name. See `guides()` for more information.

**position** For position scales, the position of the axis. `left` or `right` for y axes, `top` or `bottom` for x axes.

**super** The super class to use for the constructed scale

- **h** range of hues to use, in [0, 360]
- **c** chroma (intensity of colour), maximum value varies depending on combination of hue and luminance.
- **l** luminance (lightness), in [0, 100]
- **h.start** hue to start at
- **direction** direction to travel around the colour wheel, 1 = clockwise, -1 = counter-clockwise
- **na.value** Colour to use for missing values
- **type** One of seq (sequential), div (diverging) or qual (qualitative)
- **palette** If a string, will use that named palette. If a number, will index into the list of palettes of appropriate type. The list of available palettes can be found in the Palettes section.
- **values** if colours should not be evenly positioned along the gradient this vector gives the position (between 0 and 1) for each colour in the `colours` vector. See `rescale()` for a convenience function to map an arbitrary range to between 0 and 1.
- **space** colour space in which to calculate gradient. Must be "Lab" - other values are deprecated.
- **guide** Type of legend. Use "colourbar" for continuous colour bar, or "legend" for discrete colour legend.
- **low, high** Colours for low and high ends of the gradient.
- **mid** colour for mid point
- **midpoint** The midpoint (in data value) of the diverging scale. Defaults to 0.
- **colours, colors** Vector of colours to use for n-colour gradient.
- **start** grey value at low end of palette
- **end** grey value at high end of palette
- **alpha** pass through parameter to `viridis`
- **begin** The (corrected) hue in [0,1] at which the viridis colormap begins.
- **discrete** generate a discrete palette? (default: FALSE - generate continuous palette)
- **option** A character string indicating the colormap option to use. Four options are available: "magma" (or "A"), "inferno" (or "B"), "plasma" (or "C"), "viridis" (or "D", the default option) and "cividis" (or "E").
Value
A ggproto object inheriting from Scale

See Also

scale_edge_fill  Edge fill scales

Description
This set of scales defines new fill scales for edge geoms equivalent to the ones already defined by ggplot2. The parameters are equivalent to the ones from ggplot2 so there is nothing new under the sun. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_fill in the call to the geom - just use fill.

Usage
scale_edge_fill_hue(..., h = c(0, 360) + 15, c = 100, l = 65, h.start = 0, direction = 1, na.value = "grey50")
scale_edge_fill_brewer(..., type = "seq", palette = 1, direction = 1)
scale_edge_fill_distiller(..., type = "seq", palette = 1, direction = -1, values = NULL, space = "Lab", na.value = "grey50", guide = "edge_colourbar")
scale_edge_fill_gradient(..., low = "#132B43", high = "#56B1F7", ...
space = "Lab",
na.value = "grey50",
guide = "edge_colourbar"
)

scale_edge_fill_gradient2(
  ...,  
  low = muted("red"),
  mid = "white",
  high = muted("blue"),
  midpoint = 0,
  space = "Lab",
  na.value = "grey50",
  guide = "edge_colourbar"
)

scale_edge_fill_gradientn(
  ...,  
  colours,
  values = NULL,
  space = "Lab",
  na.value = "grey50",
  guide = "edge_colourbar",
  colors
)

scale_edge_fill_grey(..., start = 0.2, end = 0.8, na.value = "red")

scale_edge_fill_identity(..., guide = "none")

scale_edge_fill_manual(..., values)

scale_edge_fill_viridis(
  ...,  
  alpha = 1,
  begin = 0,
  end = 1,
  discrete = FALSE,
  option = "D",
  direction = 1
)

scale_edge_fill_continuous(
  ...,  
  low = "#132B43",
  high = "#56B1F7",
  space = "Lab",
  na.value = "grey50",
  }
scale_edge_fill

    guide = "edge_colourbar"

)

scale_edge_fill_discrete(
    ..., 
    h = c(0, 360) + 15,
    c = 100,
    l = 65,
    h.start = 0,
    direction = 1,
    na.value = "grey50"
)

• waiver() for the default breaks (the scale limits)
• A character vector of breaks
• A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

drop Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

scale_name The name of the scale that should be used for error messages associated with this scale.

name The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

labels One of:
• NULL for no labels
• waiver() for the default labels computed by the transformation object
• A character vector giving labels (must be same length as breaks)
• A function that takes the breaks as input and returns labels as output

expand For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function expansion() to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.
guide  A function used to create a guide or its name. See guides() for more information.
position  For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.
super  The super class to use for the constructed scale

h  range of hues to use, in [0, 360]
c  chroma (intensity of colour), maximum value varies depending on combination of hue and luminance.
l  luminance (lightness), in [0, 100]
h.start  hue to start at
direction  direction to travel around the colour wheel, 1 = clockwise, -1 = counter-clockwise
na.value  Colour to use for missing values
type  One of seq (sequential), div (diverging) or qual (qualitative)
palette  If a string, will use that named palette. If a number, will index into the list of palettes of appropriate type. The list of available palettes can be found in the Palettes section.
values  if colours should not be evenly positioned along the gradient this vector gives the position (between 0 and 1) for each colour in the colours vector. See rescale() for a convenience function to map an arbitrary range to between 0 and 1.
space  colour space in which to calculate gradient. Must be "Lab" - other values are deprecated.
guide  Type of legend. Use "colourbar" for continuous colour bar, or "legend" for discrete colour legend.
low, high  Colours for low and high ends of the gradient.
mid  colour for mid point
midpoint  The midpoint (in data value) of the diverging scale. Defaults to 0.
colours, colors  Vector of colours to use for n-colour gradient.
start  grey value at low end of palette
end  grey value at high end of palette
alpha  pass through parameter to viridis
begin  The (corrected) hue in [0,1] at which the viridis colormap begins.
discrete  generate a discrete palette? (default: FALSE - generate continuous palette)
option  A character string indicating the colormap option to use. Four options are available: "magma" (or "A"), "inferno" (or "B"), "plasma" (or "C"), "viridis" (or "D", the default option) and "cividis" (or "E").

scale_edge_linetype | Edge linetype scales

Description

This set of scales defines new linetype scales for edge geoms equivalent to the ones already defined by ggplot2. See ggplot2::scale_linetype() for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_linetype in the call to the geom - just use linetype.

Usage

scale_edge_linetype(..., na.value = “blank”)

scale_edge_linetype_continuous(...)

scale_edge_linetype_discrete(..., na.value = "blank")

scale_edge_linetype_manual(..., values)

scale_edge_linetype_identity(..., guide = "none")

Arguments

... Arguments passed on to discrete_scale

palette A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., scales::hue_pal()).

breaks One of:
  • NULL for no breaks
  • waiver() for the default breaks (the scale limits)
  • A character vector of breaks
  • A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

don Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

aesthetics The names of the aesthetics that this scale works with.
scale_edge_shape

scale_name  The name of the scale that should be used for error messages associated with this scale.
name   The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.
labels  One of:
  • NULL for no labels
  • waiver() for the default labels computed by the transformation object
  • A character vector giving labels (must be same length as breaks)
  • A function that takes the breaks as input and returns labels as output
guide   A function used to create a guide or its name. See guides() for more information.
super   The super class to use for the constructed scale
na.value   The linetype to use for NA values.
values   a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given na.value.
guide   Guide to use for this scale. Defaults to "none".

Value

A ggproto object inheriting from Scale

See Also

Other scale_edge_*: scale_edge_alpha(), scale_edge_colour, scale_edge_fill, scale_edge_shape(), scale_edge_size(), scale_edge_width(), scale_label_size()

scale_edge_shape    Edge shape scales

Description

This set of scales defines new shape scales for edge geoms equivalent to the ones already defined by ggplot2. See ggplot2::scale_shape() for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_shape in the call to the geom - just use shape.

Usage

scale_edge_shape(..., solid = TRUE)
scale_edge_shape_discrete(..., solid = TRUE)
scale_edge_shape_continuous(...)  
scale_edge_shape_manual(..., values)  
scale_edge_shape_identity(..., guide = "none")

Arguments

Arguments passed on to discrete_scale

- **palette** A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., scales::hue_pal()).

- **breaks** One of:
  - `NULL` for no breaks
  - waiver() for the default breaks (the scale limits)
  - A character vector of breaks
  - A function that takes the limits as input and returns breaks as output

- **limits** A character vector that defines possible values of the scale and their order.

- **drop** Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

- **na.translate** Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

- **na.value** If na.translate = TRUE, what value aesthetic value should missing be displayed as? Does not apply to position scales where NA is always placed at the far right.

- **aesthetics** The names of the aesthetics that this scale works with.

- **scale_name** The name of the scale that should be used for error messages associated with this scale.

- **name** The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

- **labels** One of:
  - `NULL` for no labels
  - waiver() for the default labels computed by the transformation object
  - A character vector giving labels (must be same length as breaks)
  - A function that takes the breaks as input and returns labels as output

- **guide** A function used to create a guide or its name. See guides() for more information.

- **super** The super class to use for the constructed scale

- **solid** Should the shapes be solid, TRUE, or hollow, FALSE?

- **values** a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given na.value.
scale_edge_size

Guide

Guide to use for this scale.

Value

A ggproto object inheriting from Scale

See Also

Other scale_edge_*: scale_edge_alpha(), scale_edge_colour, scale_edge_fill, scale_edge_linetype(), scale_edge_size(), scale_edge_width(), scale_label_size()

scale_edge_size  Edge size scales

Description

This set of scales defines new size scales for edge geoms equivalent to the ones already defined by ggplot2. See ggplot2::scale_size() for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_size in the call to the geom - just use size.

Usage

scale_edge_size_continuous(..., range = c(1, 6))
scale_edge_radius(..., range = c(1, 6))
scale_edge_size(..., range = c(1, 6))
scale_edge_size_discrete(..., range = c(2, 6))
scale_edge_size_area(..., max_size = 6)
scale_edge_size_manual(..., values)
scale_edge_size_identity(..., guide = "none")

Arguments

...  Arguments passed on to continuous_scale
minor_breaks  One of:
  • NULL for no minor breaks
  • waiver() for the default breaks (one minor break between each major break)
  • A numeric vector of positions
  • A function that given the limits returns a vector of minor breaks.
**scale_edge_size**

- **oob** One of:
  - Function that handles limits outside of the scale limits (out of bounds).
  - The default (*scales::censor()*), replaces out of bounds values with NA.
  - *scales::squish()* for squishing out of bounds values into range.
  - *scales::squish_infinite()* for squishing infinite values into range.

- **na.value** Missing values will be replaced with this value.

- **expand** For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function *expansion()* to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.

- **position** For position scales, The position of the axis. `left` or `right` for y axes, `top` or `bottom` for x axes.

- **super** The super class to use for the constructed scale

- **range** a numeric vector of length 2 that specifies the minimum and maximum size of the plotting symbol after transformation.

- **max_size** Size of largest points.

- **values** a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given `na.value`.

- **guide** A function used to create a guide or its name. See *guides()* for more information.

**Value**

A ggproto object inheriting from `Scale`

**Note**

In ggplot2 size conflates both line width and point size into one scale. In ggraph there is also a width scale (*scale_edge_width()*), that is used for linewidth. As edges are often represented by lines the width scale is the most common.

**See Also**

Other `scale_edge_*`: `scale_edge_alpha()`, `scale_edge_colour`, `scale_edge_fill`, `scale_edge_linetype()`, `scale_edge_shape()`, `scale_edge_width()`, `scale_label_size()`
Description

This set of scales defines width scales for edge geoms. Of all the new edge scales defined in ggraph, this is the only one not having an equivalent in ggplot2. In essence it mimics the use of size in `ggplot2::geom_line()` and related. As almost all edge representations are lines of some sort, `edge_width` will be used much more often than `edge_size`. It is not necessary to spell out that it is an edge scale as the geom knows if it is drawing an edge. Just write `width` and not `edge_width` in the call to geoms.

Usage

```r
scale_edge_width_continuous(..., range = c(1, 6))
scale_edge_width(..., range = c(1, 6))
scale_edge_width_discrete(..., range = c(2, 6))
scale_edge_width_manual(..., values)
scale_edge_width_identity(..., guide = "none")
```

Arguments

- `...` Arguments passed on to `continuous_scale`
- `minor_breaks` One of:
  - `NULL` for no minor breaks
  - `waiver()` for the default breaks (one minor break between each major break)
  - A numeric vector of positions
  - A function that given the limits returns a vector of minor breaks.
- `oob` One of:
  - Function that handles limits outside of the scale limits (out of bounds).
  - The default (`scales::censor()`) replaces out of bounds values with `NA`.
  - `scales::squish()` for squishing out of bounds values into range.
  - `scales::squish_infinite()` for squishing infinite values into range.
- `na.value` Missing values will be replaced with this value.
- `expand` For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function `expansion()` to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.
position For position scales, the position of the axis. left or right for y axes, top or bottom for x axes.

super The super class to use for the constructed scale.

range a numeric vector of length 2 that specifies the minimum and maximum size of the plotting symbol after transformation.

values a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given na.value.

guide A function used to create a guide or its name. See guides() for more information.

Value

A ggproto object inheriting from Scale

theme_graph

A theme tuned for graph visualizations

Description

When plotting graphs, networks, and trees the coordinate values are often of no importance and axes are thus a distraction. ggraph comes with a build-in theme that removes redundant elements in order to put focus on the data. Furthermore the default behaviour is to use a narrow font so text takes up less space. Theme colour is defined by a background and foreground colour where the background defines the colour of the whole graphics area and the foreground defines the colour of the strip and border. By default strip and border is turned off as it is an unnecessary element unless facetting is used. To add a foreground colour to a plot that is already using theme_graph the th_foreground helper is provided. In order to use this appearance as default use the set_graph_style function. An added benefit of this is that it also changes the default text-related values in the different geoms for a completely coherent look. unset_graph_style can be used to revert the defaults back to their default settings (that is, they are not necessarily reverted back to what they were prior to calling set_graph_style). The th_no_axes() helper is provided to modify an existing theme so that grid and axes are removed.

Usage

theme_graph(
  base_family = "Arial Narrow",
  base_size = 11,
  background = "white",
  foreground = NULL,
  border = TRUE,
  text_colour = "black",
  bg_text_colour = text_colour,
  fg_text_colour = text_colour,
  title_family = base_family,
  title_size = 18,
  title_face = "bold",
  title_margin = 10,
  title_colour = bg_text_colour,
  subtitle_family = base_family,
  subtitle_size = 12,
  subtitle_face = "plain",
  subtitle_margin = 15,
  subtitle_colour = bg_text_colour,
  strip_text_family = base_family,
  strip_text_size = 10,
  strip_text_face = "bold",
  strip_text_colour = fg_text_colour,
  caption_family = base_family,
  caption_size = 9,
  caption_face = "italic",
)
caption_margin = 10,
caption_colour = bg_text_colour,
plot_margin = margin(30, 30, 30, 30)
)

th_foreground(foreground = "grey80", fg_text_colour = NULL, border = FALSE)

th_no_axes()

set_graph_style(
  family = "Arial Narrow",
  face = "plain",
  size = 11,
  text_size = 11,
  text_colour = "black",
  ...
)

unset_graph_style()

Arguments

base_size, size, text_size, title_size, subtitle_size, strip_text_size, caption_size
  The size to use for the various text elements. text_size will be used as geom
defaults

background
  The colour to use for the background. This theme sets all background elements
  except for plot.background to element_blank so this controls the background
  for all elements of the plot. Set to NA to remove the background (thus making
  the plot transparent)

foreground
  The colour of foreground elements, specifically strip and border. Set to NA to
  remove.

border
  Logical. Should border be drawn if a foreground colour is provided?

text_colour, bg_text_colour, fg_text_colour, title_colour, subtitle_colour, strip_text_colour, caption_colour
  The colour of the text in the various text elements

title_margin, subtitle_margin, caption_margin
  The margin to use between the text elements and the plot area

plot_margin
  The plot margin

family, base_family, title_family, subtitle_family, strip_text_family, caption_family
  The font to use for the different elements

face, title_face, subtitle_face, strip_text_face, caption_face
  The fontface to use for the various text elements

... Parameters passed on the theme_graph

Examples

library(tidygraph)
graph <- as_tbl_graph(highschool)
whigs

Description

This dataset shows the membership of 136 colonial Americans in 5 whig organization and is a bipartite graph. The data appeared in the appendix to David Hackett Fischer’s *Paul Revere’s Ride* (Oxford University Press, 1995) and compiled by Kieran Healy for the blog post Using Metadata to Find Paul Revere.

Usage

whigs

Format

The data is stored as an incidence matrix with persons as rows and organizations as columns. A 0 means no membership while a one means membership.
