Package ‘ggstatsplot’

January 15, 2022

Type Package

Title ‘ggplot2’ Based Plots with Statistical Details

Version 0.9.1

Maintainer Indrajeet Patil <patilindrajeet.science@gmail.com>

Description Extension of ‘ggplot2’, ‘ggstatsplot’ creates graphics with
details from statistical tests included in the plots themselves. It
provides an easier syntax to generate information-rich plots for
statistical analysis of continuous (violin plots, scatterplots,
histograms, dot plots, dot-and-whisker plots) or categorical (pie and
bar charts) data. Currently, it supports the most common types of
statistical approaches and tests: parametric, nonparametric, robust,
and Bayesian versions of t-test/ANOVA, correlation analyses,
contingency table analysis, meta-analysis, and regression analyses.

ggstatsplot-package

Description

{ggstatsplot} is an extension of {ggplot2} package. It creates graphics with details from statistical tests included in the plots themselves. It provides an easier API to generate information-rich plots for statistical analysis of continuous (violin plots, scatterplots, histograms, dot plots, dot-and-whisker plots) or categorical (pie and bar charts) data. Currently, it supports the most common types of statistical tests: parametric, nonparametric, robust, and Bayesian versions of t-test/ANOVA, correlation analyses, contingency table analysis, meta-analysis, and regression analyses.

Details

ggstatsplot

The main functions are:

- \texttt{ggbetweenstats} function to produce information-rich comparison plot \textit{between} different groups or conditions with \texttt{ggplot2} and details from the statistical tests in the subtitle.
- \texttt{ggwithinstats} function to produce information-rich comparison plot \textit{within} different groups or conditions with \texttt{ggplot2} and details from the statistical tests in the subtitle.
- \texttt{gscatterstats} function to produce \texttt{ggplot2} scatterplots along with a marginal distribution plots from \texttt{ggside} package and details from the statistical tests in the subtitle.
- \texttt{gpiestats} function to produce pie chart with details from the statistical tests in the subtitle.
- \texttt{ggbarstats} function to produce stacked bar chart with details from the statistical tests in the subtitle.
- \texttt{gghistostats} function to produce histogram for a single variable with results from one sample test displayed in the subtitle.
- \texttt{ggdotplotstats} function to produce Cleveland-style dot plots/charts for a single variable with labels and results from one sample test displayed in the subtitle.
- \texttt{ggcorrmat} function to visualize the correlation matrix.
- \texttt{ggcoefstats} function to visualize results from regression analyses.
- \texttt{combine_plots} helper function to combine multiple \texttt{ggstatsplot} plots using \texttt{patchwork::wrap_plots()}.

For more documentation, see the dedicated Website.

bugs_long

*Tidy version of the "Bugs" dataset.*

Description

Tidy version of the "Bugs" dataset.

Usage

`bugs_long`

Format

A data frame with 372 rows and 6 variables

- subject. Dummy identity number for each participant.
- gender. Participant’s gender (Female, Male).
- region. Region of the world the participant was from.
- education. Level of education.
- condition. Condition of the experiment the participant gave rating for (LDLF: low freighteningness and low disgustingness; LFHD: low freighteningness and high disgustingness; HFHD: high freighteningness and low disgustingness; HFHD: high freighteningness and high disgustingness).
- desire. The desire to kill an arthropod was indicated on a scale from 0 to 10.

Details

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in freighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

Source

Examples

```r
dim(bugs_long)
head(bugs_long)
dplyr::glimpse(bugs_long)
```
Description

Wide-format version of the "Bugs" dataset.

Usage

bugs_wide

Format

A data frame with 93 rows and 6 variables

- subject. Dummy identity number for each participant.
- gender. Participant’s gender (Female, Male).
- region. Region of the world the participant was from.
- education. Level of education.
- ldlf,ldhf,hdlf,hdfh. The desire to kill an arthropod was indicated on a scale from 0 to 10 in each condition of the experiment (LDLF: low frighteningness and low disgustingness; LFHD: low frighteningness and high disgustingness; HFHD: high frighteningness and low disgustingness; HFHD: high frighteningness and high disgustingness).

Details

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in frighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

Examples

dim(bugs_wide)
head(bugs_wide)
dplyr::glimpse(bugs_wide)
combine_plots

Combining and arranging multiple plots in a grid

Description

Wrapper around patchwork::wrap_plots that will return a combined grid of plots with annotations. In case you want to create a grid of plots, it is **highly recommended** that you use {patchwork} package directly and not this wrapper around it which is mostly useful with {ggstatsplot} plots. It is exported only for backward compatibility.

Usage

```r
combine_plots(
  plotlist,
  plotgrid.args = list(),
  annotation.args = list(),
  guides = "collect",
  ...
)
```

Arguments

- `plotlist`: A list containing `ggplot` objects.
- `plotgrid.args`: A list of additional arguments passed to `patchwork::wrap_plots`, except for `guides` argument which is already separately specified here.
- `annotation.args`: A list of additional arguments passed to `patchwork::plot_annotation`.
- `guides`: A string specifying how guides should be treated in the layout. 'collect' will collect guides below to the given nesting level, removing duplicates. 'keep' will stop collection at this level and let guides be placed alongside their plot. auto will allow guides to be collected if a upper level tries, but place them alongside the plot if not. If you modify default guide "position" with `theme(legend.position=...)` while also collecting guides you must apply that change to the overall patchwork (see example).
- `...`: Currently ignored.

Value

Combined plot with annotation labels

Examples

```r
# loading the necessary libraries
library(ggplot2)

# preparing the first plot
p1 <- ggplot(
data = subset(iris, iris$Species == "setosa"),
aes(x = Sepal.Length, y = Sepal.Width)
) +
  geom_point() +
  labs(title = "setosa")

# preparing the second plot
p2 <- ggplot(
  data = subset(iris, iris$Species == "versicolor"),
  aes(x = Sepal.Length, y = Sepal.Width)
) +
  geom_point() +
  labs(title = "versicolor")

# combining the plot with a title and a caption
combine_plots(
  plotlist = list(p1, p2),
  plotgrid.args = list(nrow = 1),
  annotation.args = list(
    tag_levels = "a",
    title = "Dataset: Iris Flower dataset",
    subtitle = "Edgar Anderson collected this data",
    caption = "Note: Only two species of flower are displayed",
    theme = theme(
      plot.subtitle = element_text(size = 20),
      plot.title = element_text(size = 30)
    )
  )
)

extract_stats(Extracting dataframes with statistical details from \{ggstatsplot\}]

Description

Extracting dataframes with statistical details from \{ggstatsplot\}

Usage

extract_stats(p, ...)

Arguments

p A plot from \{ggstatsplot\} package

... Ignored
Details

This is a convenience function to extract dataframes with statistical details that are used to create expressions displayed in ggstatsplot plots as subtitle and/or as caption. Note that all of this analysis is carried out by the statsExpressions package.

For more details about underlying tests and effect size estimates, see the following vignette: https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Value

A list of tibbles containing statistical analysis summaries.

Examples

```r
if (require("PMCMRplus")) {
  set.seed(123)
  library(ggstatsplot)

  # in case of group comparisons
  p <- ggbetweenstats(mtcars, cyl, mpg)
  extract_stats(p)

  # the exact details depend on the function
  extract_stats(ggbarstats(mtcars, cyl, am))
}
```

---

**ggbarstats**  
*Bar (column) charts with statistical tests*

Description

Bar charts for categorical data with statistical details included in the plot as a subtitle.

Usage

```r
ggbarstats(
  data,
  x,
  y,
  counts = NULL,
  type = "parametric",
  paired = FALSE,
  results.subtitle = TRUE,
  label = "percentage",
  label.args = list(alpha = 1, fill = "white"),
  k = 2L,
  proportion.test = results.subtitle,
  perc.k = 0L,
)```
Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.

x The variable to use as the rows in the contingency table. Please note that if there
are empty factor levels in your variable, they will be dropped.

y The variable to use as the columns in the contingency table. Please note that
if there are empty factor levels in your variable, they will be dropped. Default
is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run
for the x variable. Otherwise an appropriate association test will be run. This
argument can not be NULL for ggbarstats function.

counts A string naming a variable in data containing counts, or NULL if each row rep-3
resents a single observation.

type A character specifying the type of statistical approach:

  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.

paired Logical indicating whether data came from a within-subjects or repeated mea-
sures design study (Default: FALSE). If TRUE, McNemar’s test expression will be
returned. If FALSE, Pearson’s chi-square test will be returned.

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle
(DefaultValue: TRUE). If set to FALSE, only the plot will be returned.
**label**  
Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

**label.args**  
Additional aesthetic arguments that will be passed to geom_label.

**k**  
Number of digits after decimal point (should be an integer) (Default: $k = 2L$).

**proportion.test**  
Decides whether proportion test for $x$ variable is to be carried out for each level of $y$. Defaults to results.subtitle. In ggbarstats, only $p$-values from this test will be displayed.

**perc.k**  
Numeric that decides number of decimal places for percentage labels (Default: 0L).

**bf.message**  
Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

**ratio**  
A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be $ratio = c(0.5, 0.5)$ or if there are four levels this will be $ratio = c(0.25, 0.25, 0.25, 0.25)$, etc.

**conf.level**  
Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals ($0.95$).

**sampling.plan**  
Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

**fixed.margin**  
For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

**prior.concentration**  
Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey’s (1974) "a" parameter.

**title**  
The text for the plot title.

**subtitle**  
The text for the plot subtitle. Will work only if results.subtitle = FALSE.

**caption**  
The text for the plot caption.

**legend.title**  
Title text for the legend.

**xlab**  
Custom text for the $x$ axis label (Default: NULL, which will cause the $x$ axis label to be the $x$ variable).

**ylab**  
Custom text for the $y$ axis label (Default: NULL).

**ggtheme**  
A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

**package**  
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(palettiere::palettes_d_names).

**palette**  
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(palettiere::palettes_d_names).
ggbetweenstats

**ggplot.component**
A `ggplot` component to be added to the plot prepared by `{ggstatsplot}`). This argument is primarily helpful for grouped_ variants of all primary functions. Default is `NULL`. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.

**output**
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a `NULL`. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a `NULL`.

... Currently ignored.

**Details**
For details, see: [https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggpiestats.html](https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggpiestats.html)

**See Also**
`grouped_ggbarstats`, `ggpiestats`, `grouped_ggpiestats`

**Examples**

```r
# for reproducibility
set.seed(123)
library(ggstatsplot)

# association test (or contingency table analysis)
ggbarstats(mtcars, x = vs, y = cyl)
```

---

**Box/Violin plots for between-subjects comparisons**

**Description**
A combination of box and violin plots along with jittered data points for between-subjects designs with statistical details included in the plot as a subtitle.

**Usage**

```r
ggbetweenstats(
  data, 
  x, 
  y, 
  plot.type = "boxviolin",
```
type = "parametric",
pairwise.comparisons = TRUE,
pairwise.display = "significant",
p.adjust.method = "holm",
effsize.type = "unbiased",
bf.prior = 0.707,
bf.message = TRUE,
results.subtitle = TRUE,
xlab = NULL,
ylab = NULL,
caption = NULL,
title = NULL,
subtitle = NULL,
k = 2L,
var.equal = FALSE,
conf.level = 0.95,
nboot = 100L,
tr = 0.2,
centrality.plotting = TRUE,
centrality.type = type,
centrality.point.args = list(size = 5, color = "darkred"),
centrality.label.args = list(size = 3, nudge.x = 0.4, segment.linetype = 4,
   min.segment.length = 0),
outlier.tagging = FALSE,
outlier.label = NULL,
outlier.coeff = 1.5,
outlier.shape = 19,
outlier.color = "black",
outlier.label.args = list(size = 3),
point.args = list(position = ggplot2::position_jitterdodge(dodge.width = 0.6), alpha
   = 0.4, size = 3, stroke = 0),
violin.args = list(width = 0.5, alpha = 0.2),
ggsignif.args = list(textsize = 3, tip.length = 0.01),
ggtheme = ggstatsplot::theme_ggstatsplot(),
package = "RColorBrewer",
palette = "Dark2",
ggplot.component = NULL,
output = "plot",
...)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.

x The grouping (or independent) variable from the dataframe data. In case of
a repeated measures or within-subjects design, if subject.id argument is not
available or not explicitly specified, the function assumes that the data has al-
ready been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

y
The response (or outcome or dependent) variable from the dataframe data.

plot.type
Character describing the type of plot. Currently supported plots are "box" (for only boxplots), "violin" (for only violin plots), and "boxviolin" (for a combination of box and violin plots; default).

type
A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

pairwise.comparisons
Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

pairwise.display
Decides which pairwise comparisons to display. Available options are:
- "significant" (abbreviation accepted: "s")
- "non-significant" (abbreviation accepted: "ns")
- "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

p.adjust.method
Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

effsize.type
Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

bf.prior
A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors.

bf.message
Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle
Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

xlab, ylab
Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.
caption  The text for the plot caption.
title   The text for the plot title.
subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.
k       Number of digits after decimal point (should be an integer) (Default: k = 2L).
var.equal a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.
conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
nboot   Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).
tr       Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.
  • mean for parametric statistics
  • median for non-parametric statistics
  • trimmed mean for robust statistics
  • MAP estimator for Bayesian statistics
If you want default centrality parameter, you can specify this using centrality.type argument.
centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:
  • "parametric" (for mean)
  • "nonparametric" (for median)
  • robust (for trimmed mean)
  • bayes (for MAP estimator)
Just as type argument, abbreviations are also accepted.
centrality.point.args, centrality.label.args A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.
outlier.tagging Decides whether outliers should be tagged (Default: FALSE).
outlier.label Label to put on the outliers that have been tagged. This can’t be the same as x argument.
outlier.coef Coefficient for outlier detection using Tukey’s method. With Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).
Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

Default aesthetics for outliers (Default: "black").

A list of additional aesthetic arguments to be passed to `ggrepel::geom_label_repel` for outlier label plotting.

A list of additional aesthetic arguments to be passed to the `geom_point` displaying the raw data.

A list of additional aesthetic arguments to be passed to the `geom_violin`.

A list of additional aesthetic arguments to be passed to `ggsignif::geom_signif`.

A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`. Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()` etc.).

Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running `View(paletteer::palettes_d_names)`.

A ggplot component to be added to the plot prepared by `{ggstatsplot}`). This argument is primarily helpful for `grouped_` variants of all primary functions. Default is `NULL`. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.

Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a `NULL`. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a `NULL`.

Currently ignored.

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggbetweenstats.html

ggcoefstats  

*Dot-and-whisker plots for regression analyses*

**Description**

Plot with the regression coefficients’ point estimates as dots with confidence interval whiskers and other statistical details included as labels.

**Usage**

```r
ggcoefstats(
  x,
  output = "plot",
  statistic = NULL,
  conf.int = TRUE,
  conf.level = 0.95,
  k = 2L,
  exclude.intercept = FALSE,
  effsize = "eta",
  meta.analytic.effect = FALSE,
  meta.type = "parametric",
  bf.message = TRUE,
  sort = "none",
  xlab = NULL,
  ylab = NULL,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
```
only.significant = FALSE,
point.args = list(size = 3, color = "blue"),
errorbar.args = list(height = 0),
vline = TRUE,
vline.args = list(size = 1, linetype = "dashed"),
stats.labels = TRUE,
stats.label.color = NULL,
stats.label.args = list(size = 3, direction = "y", min.segment.length = 0),
package = "RColorBrewer",
palette = "Dark2",
ggtheme = ggstatsplot::theme_ggstatsplot(),
...)

Arguments

x          A model object to be tidied, or a tidy data frame containing results from a regression model. Function internally uses parameters::model_parameters() to get a tidy data frame. If a dataframe is entered, it must contain at least two columns named term (names of predictors) and estimate (corresponding estimates of coefficients or other quantities of interest).
output     Character describing the expected output from this function: "plot" (visualization of regression coefficients) or "tidy" (tidy dataframe of results parameters::model_parameters) or "glance" (object from performance::model_performance).
statistic  Which statistic is to be displayed (either "t" or "f" or "z" or "chi") in the label. This is relevant if the x argument is a dataframe.
conf.int   Logical. Decides whether to display confidence intervals as error bars (Default: TRUE).
conf.level Numeric deciding level of confidence or credible intervals (Default: 0.95).
k          Number of digits after decimal point (should be an integer) (Default: k = 2L).
exclude.intercept Logical that decides whether the intercept should be excluded from the plot (Default: FALSE).
effsize    Character describing the effect size to be displayed: "eta" (default) or "omega". This argument is relevant only for models objects with F-statistic.
meta.analytic.effect Logical that decides whether subtitle for meta-analysis via linear (mixed-effects) models (default: FALSE). If TRUE, input to argument subtitle will be ignored. This will be mostly relevant if a data frame with estimates and their standard errors is entered.
meta.type   Type of statistics used to carry out random-effects meta-analysis. If "parametric" (default), metafor::rma function will be used. If "robust", metaPlus::metaPlus function will be used. If "bayes", metaBMA::meta_random function will be used.
bf.message  Logical that decides whether results from running a Bayesian meta-analysis assuming that the effect size $d$ varies across studies with standard deviation $t$ (i.e., a random-effects analysis) should be displayed in caption. Defaults to TRUE.
sort      If "none" (default) do not sort, "ascending" sort by increasing coefficient value, or "descending" sort by decreasing coefficient value.

xlab     Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

ylab     Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

title    The text for the plot title.

subtitle The text for the plot subtitle. The input to this argument will be ignored if meta.analytic.effect is set to TRUE.

caption  The text for the plot caption.

only.significant If TRUE, only stats labels for significant effects is shown (Default: FALSE). This can be helpful when a large number of regression coefficients are to be displayed in a single plot. Relevant only when the output is a plot.

point.args Additional arguments that will be passed to geom_point geom. Please see documentation for that function to know more about these arguments.

errorbar.args Additional arguments that will be passed to geom_errorbarh geom. Please see documentation for that function to know more about these arguments.

vline     Decides whether to display a vertical line (Default: "TRUE").

vline.args Additional arguments that will be passed to geom_vline geom. Please see documentation for that function to know more about these arguments.

stats.labels Logical. Decides whether the statistic and p-values for each coefficient are to be attached to each dot as a text label using ggrepel (Default: TRUE).

stats.label.color Color for the labels. If set to NULL, colors will be chosen from the specified package (Default: "RColorBrewer") and palette (Default: "Dark2").

stats.label.args Additional arguments that will be passed to ggrepel::geom_label_repel geom. Please see documentation for that function to know more about these arguments.

package   Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

palette   Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggtheme   A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

... Additional arguments to tidying method. For more, see parameters::model_parameters.

Details

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggcoefstats.html
Note

1. In case you want to carry out meta-analysis, you will be asked to install the needed packages ({metafor}, {metaplus}, or {metaBMA}) for meta-analysis (if unavailable).

2. All rows of regression estimates where either of the following quantities is NA will be removed if labels are requested: estimate, statistic, p.value.

3. Given the rapid pace at which new methods are added to these packages, it is recommended that you install the GitHub versions of {parameters} and {performance} in order to make most of this function.

Examples

```r
# for reproducibility
set.seed(123)
library(ggstatsplot)

# model object
mod <- lm(formula = mpg ~ cyl * am, data = mtcars)

# to get a plot
ggcoefstats(mod, output = "plot")

# to get a tidy dataframe
ggcoefstats(mod, output = "tidy")

# to get a glance summary
ggcoefstats(mod, output = "glance")
```

---

ggcorrmat

**Visualization of a correlation matrix**

**Description**

Correlation matrix or a dataframe containing results from pairwise correlation tests. The package internally uses ggcorrplot::ggcorrplot for creating the visualization matrix, while the correlation analysis is carried out using the correlation::correlation function.

**Usage**

```r
ggcorrmat(
  data,
  cor.vars = NULL,
  cor.vars.names = NULL,
  output = "plot",
  matrix.type = "upper",
  type = "parametric",
)```
tr = 0.2,
partial = FALSE,
k = 2L,
sig.level = 0.05,
conf.level = 0.95,
bf.prior = 0.707,
p.adjust.method = "holm",
pch = "cross",
ggcorrplot.args = list(method = "square", outline.color = "black", pch.cex = 14),
package = "RColorBrewer",
palette = "Dark2",
colors = c("#E69F00", "white", "#009E73"),
ggtheme = ggstatsplot::theme_ggstatsplot(),
ggplot.component = NULL,
title = NULL,
subtitle = NULL,
caption = NULL,
...
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Dataframe from which variables specified are preferentially to be taken.</td>
</tr>
<tr>
<td>cor.vars</td>
<td>List of variables for which the correlation matrix is to be computed and visualized. If NULL (default), all numeric variables from data will be used.</td>
</tr>
<tr>
<td>cor.vars.names</td>
<td>Optional list of names to be used for cor.vars. The names should be entered in the same order.</td>
</tr>
<tr>
<td>output</td>
<td>Character that decides expected output from this function. If &quot;plot&quot;, the visualization matrix will be returned. If &quot;dataframe&quot; (or literally anything other than &quot;plot&quot;), a dataframe containing all details from statistical analyses (e.g., correlation coefficients, statistic values, p-values, no. of observations, etc.) will be returned.</td>
</tr>
<tr>
<td>matrix.type</td>
<td>Character, &quot;upper&quot; (default), &quot;lower&quot;, or &quot;full&quot;, display full matrix, lower triangular or upper triangular matrix.</td>
</tr>
</tbody>
</table>
| type       | A character specifying the type of statistical approach:  
\quad - "parametric"  
\quad - "nonparametric"  
\quad - "robust"  
\quad - "bayes"  
You can specify just the initial letter. |
| tr         | Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help. |
| partial    | Can be TRUE for partial correlations. For Bayesian partial correlations, "full" instead of pseudo-Bayesian partial correlations (i.e., Bayesian correlation based on frequentist partialization) are returned. |
**ggcorrmat**

- **k**
  Number of digits after decimal point (should be an integer) (Default: \(k = 2L\)).

- **sig.level**
  Significance level (Default: \(0.05\)). If the \(p\)-value in \(p\)-value matrix is bigger than sig.level, then the corresponding correlation coefficient is regarded as insignificant and flagged as such in the plot. Relevant only when output = "plot".

- **conf.level**
  Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (\(0.95\)).

- **bf.prior**
  A number between \(0.5\) and \(2\) (default \(0.707\)), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to \(r\) scale values of \(1/2\), sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

- **p.adjust.method**
  Adjustment method for \(p\)-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

- **pch**
  Decides the point shape to be used for insignificant correlation coefficients (only valid when insig = "pch"). Default: pch = "cross".

- **ggcorrplot.args**
  A list of additional (mostly aesthetic) arguments that will be passed to ggcorrplot::ggcorrplot function. The list should avoid any of the following arguments since they are already internally being used: corr, method, p.mat, sig.level, ggtheme, colors, lab, pch, legend.title, digits.

- **package**
  Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

- **palette**
  Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

- **colors**
  A vector of 3 colors for low, mid, and high correlation values. If set to NULL, manual specification of colors will be turned off and 3 colors from the specified palette from package will be selected.

- **ggtheme**
  A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

- **ggplot.component**
  A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

- **title**
  The text for the plot title.

- **subtitle**
  The text for the plot subtitle. Will work only if results.subtitle = FALSE.

- **caption**
  The text for the plot caption.

- **...**
  Currently ignored.

  data = ggplot2::msleep,
  cor.vars = sleep_total:bodywt,
  partial = TRUE,
  output = "dataframe"
)

ggdotplotstats

Dot plot/chart for labeled numeric data.

Description

A dot chart (as described by William S. Cleveland) with statistical details from one-sample test details.

Usage

ggdotplotstats(
  data,
  x,
  y,
  xlab = NULL,
  ylab = NULL,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  type = "parametric",
  test.value = 0,
  bf.prior = 0.707,
  bf.message = TRUE,
Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.
x A numeric variable from the dataframe data.
y Label or grouping variable.
xlab Labels for x and y axis variables. If NULL (default), variable names for x and y
will be used.
ylab Labels for x and y axis variables. If NULL (default), variable names for x and y
will be used.
title The text for the plot title.
subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption The text for the plot caption.
type A character specifying the type of statistical approach:
• "parametric"
• "nonparametric"
• "robust"
• "bayes"
You can specify just the initial letter.
test.value A number indicating the true value of the mean (Default: 0).
bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calcu-
lating Bayes factors and posterior estimates. In addition to numeric arguments,
several named values are also recognized: "medium", "wide", and "ultrawide",
corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of
an ANOVA, this value corresponds to scale for fixed effects.
bf.message Logical that decides whether to display Bayes Factor in favor of the null hypo-
thesis. This argument is relevant only for parametric test (Default: TRUE).
effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for
Cohen’s d) or "g" (for Hedge’s g).
conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

point.args A list of additional aesthetic arguments passed to geom_point.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

• mean for parametric statistics
• median for non-parametric statistics
• trimmed mean for robust statistics
• MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

• "parametric" (for mean)
• "nonparametric" (for median)
• robust (for trimmed mean)
• bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

centrality.line.args A list of additional aesthetic arguments to be passed to the geom_line used to display the lines corresponding to the centrality parameter.

ggplot.component A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.

ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE,
then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

Details

For details, see: [https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggdotplotstats.html](https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggdotplotstats.html)

Examples

```r
# for reproducibility
set.seed(123)

# plot
ggdotplotstats(
ex = cty,
y = manufacturer,
title = "Fuel economy data",
xlab = "city miles per gallon"
)
```

**gghistostats**

*Histogram for distribution of a numeric variable*

Description

Histogram with statistical details from one-sample test included in the plot as a subtitle.

Usage

```r
gghistostats(
data, 
x, 
binwidth = NULL, 
xlab = NULL, 
title = NULL, 
subtitle = NULL, 
caption = NULL, 
type = "parametric",
```
test.value = 0,
bf.prior = 0.707,
bf.message = TRUE,
effsize.type = "g",
conf.level = 0.95,
tr = 0.2,
k = 2L,
ggtheme = ggstatsplot::theme_ggstatsplot(),
results.subtitle = TRUE,
bin.args = list(color = "black", fill = "grey50", alpha = 0.7),
centrality.plotting = TRUE,
centrality.type = type,
centrality.line.args = list(color = "blue", size = 1, linetype = "dashed"),
normal.curve = FALSE,
normal.curve.args = list(size = 2),
ggplot.component = NULL,
output = "plot",
...
)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.
x A numeric variable from the dataframe data.
binwidth The width of the histogram bins. Can be specified as a numeric value, or a
function that calculates width from x. The default is to use the max(x) - min(x)
/ sqrt(N). You should always check this value and explore multiple widths to
find the best to illustrate the stories in your data.
xlab Labels for x and y axis variables. If NULL (default), variable names for x and y
will be used.
title The text for the plot title.
subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption The text for the plot caption.
type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.
test.value A number indicating the true value of the mean (Default: 0).
bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calcu-
ating Bayes factors and posterior estimates. In addition to numeric arguments,
several named values are also recognized: "medium", "wide", and "ultrawide",
corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of
an ANOVA, this value corresponds to scale for fixed effects.
bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for Cohen’s d) or "g" (for Hedge’s g).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

ggtheme A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

bin.args A list of additional aesthetic arguments to be passed to the stat_bin used to display the bins. Do not specify binwidth argument in this list since it has already been specified using the dedicated argument.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

• mean for parametric statistics
• median for non-parametric statistics
• trimmed mean for robust statistics
• MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

• "parametric" (for mean)
• "nonparametric" (for median)
• robust (for trimmed mean)
• bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

centrality.line.args A list of additional aesthetic arguments to be passed to the geom_line used to display the lines corresponding to the centrality parameter.

normal.curve A logical value that decides whether to super-impose a normal curve using stats::dnorm(mean(x), sd(x)). Default is FALSE.
normal.curve.args

A list of additional aesthetic arguments to be passed to the normal curve.

ggplot.component

A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

output

Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

...  
Currently ignored.

Outline

- ggpiestats

Pie charts with statistical tests

Description

Pie charts for categorical data with statistical details included in the plot as a subtitle.
Usage

```r
ggpiestats(
  data, 
  x, 
  y = NULL, 
  counts = NULL, 
  type = "parametric", 
  paired = FALSE, 
  results.subtitle = TRUE, 
  label = "percentage", 
  label.args = list(direction = "both"), 
  label.repel = FALSE, 
  k = 2L, 
  proportion.test = results.subtitle, 
  perc.k = 0L, 
  bf.message = TRUE, 
  ratio = NULL, 
  conf.level = 0.95, 
  sampling.plan = "indepMulti", 
  fixed.margin = "rows", 
  prior.concentration = 1, 
  title = NULL, 
  subtitle = NULL, 
  caption = NULL, 
  legend.title = NULL, 
  ggtheme = ggstatsplot::theme_ggstatsplot(), 
  package = "RColorBrewer", 
  palette = "Dark2", 
  ggplot.component = NULL, 
  output = "plot", 
  ...
)
```

Arguments

- `data` A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.
- `x` The variable to use as the **rows** in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.
- `y` The variable to use as the **columns** in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for ggbarstats function.
- `counts` A string naming a variable in data containing counts, or NULL if each row represents a single observation.
- `type` A character specifying the type of statistical approach:
You can specify just the initial letter.

**paired**

Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test expression will be returned. If FALSE, Pearson's chi-square test will be returned.

**results.subtitle**

Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

**label**

Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

**label.args**

Additional aesthetic arguments that will be passed to geom_label.

**label.repel**

Whether labels should be repelled using ggrepel package. This can be helpful in case the labels are overlapping.

**k**

Number of digits after decimal point (should be an integer) (Default: k = 2L).

**proportion.test**

Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to results.subtitle. In ggbarstats, only p-values from this test will be displayed.

**perc.k**

Numeric that decides number of decimal places for percentage labels (Default: 0L).

**bf.message**

Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

**ratio**

A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5, 0.5) or if there are four levels this will be ratio = c(0.25, 0.25, 0.25, 0.25), etc.

**conf.level**

Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

**sampling.plan**

Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

**fixed.margin**

For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

**prior.concentration**

Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

**title**

The text for the plot title.

**subtitle**

The text for the plot subtitle. Will work only if results.subtitle = FALSE.
ggpiestats

caption
The text for the plot caption.

legend.title
Title text for the legend.

ggtheme
A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot().
Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

package
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

palette
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggplot.component
A \texttt{ggplot} component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is \texttt{NULL}. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

output
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

...  
Currently ignored.

ggscatterstats

Scatterplot with marginal distributions and statistical results

Description

Scatterplots from \{ggplot2\} combined with marginal densigram (density + histogram) plots with statistical details.

Usage

```r
ggscatterstats(
  data,
  x,
  y,
  type = "parametric",
  conf.level = 0.95,
  bf.prior = 0.707,
  bf.message = TRUE,

  subtitle = NULL,
  caption = NULL,
  ggtheme = ggstatsplot::theme_ggstatsplot(),
  ggplot.component = NULL,
  output = "plot",
  ...
)
```
Arguments

data  A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.

x  The column in data containing the explanatory variable to be plotted on the
x-axis.

y  The column in data containing the response (outcome) variable to be plotted on
the y-axis.

type  A character specifying the type of statistical approach:

• "parametric"
• "nonparametric"
• "robust"
• "bayes"

You can specify just the initial letter.

conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible
intervals (0.95).

bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use in calcu-
lating Bayes factors and posterior estimates. In addition to numeric arguments,
several named values are also recognized: "medium", "wide", and "ultrawide",
corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of
an ANOVA, this value corresponds to scale for fixed effects.

bf.message  Logical that decides whether to display Bayes Factor in favor of the null
hypothesis. This argument is relevant only for parametric test (Default: TRUE).

tr  Trim level for the mean when carrying out robust tests. In case of an error,
try reducing the value of tr, which is by default set to 0.2. Lowering the value
might help.

k  Number of digits after decimal point (should be an integer) (Default: k = 2L).

results.subtitle  Decides whether the results of statistical tests are to be displayed as a subtitle
(Default: TRUE). If set to FALSE, only the plot will be returned.

label.var  Variable to use for points labels entered as a symbol (e.g. var1).

label.expression  An expression evaluating to a logical vector that determines the subset of data
points to label (e.g. y < 4 & z < 20). While using this argument with purrr::pmap,
you will have to provide a quoted expression (e.g. quote(y < 4 & z < 20)).

marginal  Decides whether marginal distributions will be plotted on axes using ggscale
functions. The default is TRUE. The package ggscale must already be installed
by the user.

xfill, yfill  Character describing color fill for x and y axes marginal distributions (default:
"#009E73" (for x) and "#D55E00" (for y)). Note that the defaults are colorblind-
friendly.

point.args  A list of additional aesthetic arguments to be passed to geom_point geom used
to display the raw data points.
point.width.jitter, point.height.jitter
    Degree of jitter in x and y direction, respectively. Defaults to 0 (0%) of the resolution of the data. Note that the jitter should not be specified in the point.args because this information will be passed to two different geoms: one displaying the points and the other displaying the *labels* for these points.

point.label.args
    A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel geom used to display the labels.

smooth.line.args
    A list of additional aesthetic arguments to be passed to geom_smooth geom used to display the regression line.

xsidehistogram.args, ysidehistogram.args
    A list of arguments passed to respective geom_s from ggside package to change the marginal distribution histograms plots.

xlab
    Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

ylab
    Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

The text for the plot title.

subtitle
    The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption
    The text for the plot caption.

ggtheme
    A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

ggplot.component
    A ggplot component to be added to the plot prepared by {ggstatsplot}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a {ggplot2} function or a list of {ggplot2} functions.

output
    Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

Details

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggscatterstats.html

Note

The plot uses ggrepel::geom_label_repel to attempt to keep labels from over-lapping to the largest degree possible. As a consequence plot times will slow down massively (and the plot file will grow in size) if you have a lot of labels that overlap.

Examples

# to get reproducible results from bootstrapping
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)

# creating dataframe with rownames converted to a new column
mtcars_new <- as_tibble(mtcars, rownames = "car")

# simple function call with the defaults
if (require("ggside")) {
  ggscatterstats(
    data = mtcars_new,
    x = wt,
    y = mpg,
    label.var = car,
    label.expression = wt < 4 & mpg < 20
  ) + # making further customization with '{ggplot2}' functions
    geom_rug(sides = "b")
}

ggwithinstats

Box/Violin plots for within-subjects (or repeated measures) comparisons

Description

A combination of box and violin plots along with raw (unjittered) data points for within-subjects designs with statistical details included in the plot as a subtitle.

Usage

ggwithinstats(
  data,
  x,
  y,
  type = "parametric",
  pairwise.comparisons = TRUE,
  pairwise.display = "significant",
  p.adjust.method = "holm",
  effsize.type = "unbiased",
  bf.prior = 0.707,
  bf.message = TRUE,
  results.subtitle = TRUE,
xlab = NULL,
ylab = NULL,
caption = NULL,
title = NULL,
subtitle = NULL,
k = 2L,
conf.level = 0.95,
nboot = 100L,
tr = 0.2,
centrality.plotting = TRUE,
centrality.type = type,
centrality.point.args = list(size = 5, color = "darkred"),
centrality.label.args = list(size = 3, nudge_x = 0.4, segment.linetype = 4),
centrality.path = TRUE,
centrality.path.args = list(size = 1, color = "red", alpha = 0.5),
point.args = list(size = 3, alpha = 0.5),
point.path = TRUE,
point.path.args = list(alpha = 0.5, linetype = "dashed"),
outlier.tagging = FALSE,

ggtheme = ggstatsplot::theme_ggstatsplot(),
package = "RColorBrewer",
palette = "Dark2",
ggplot.component = NULL,
output = "plot",
...
)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

x The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1,subject-2,..., pattern.

y The response (or outcome or dependent) variable from the dataframe data.

type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
• "robust"
• "bayes"

You can specify just the initial letter.

pairwise.comparisons
Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

pairwise.display
Decides which pairwise comparisons to display. Available options are:
• "significant" (abbreviation accepted: "s")
• "non-significant" (abbreviation accepted: "ns")
• "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

p.adjust.method
Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

effsize.type
Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

bf.prior
A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors.

bf.message
Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle
Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

xlab
Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

ylab
Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

caption
The text for the plot caption.

title
The text for the plot title.

subtitle
The text for the plot subtitle. Will work only if results.subtitle = FALSE.

k
Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level
Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

nboot
Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).
Tr trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

centrality.plotting
 Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type
 Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

centrality.point.args
 A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.

centrality.label.args
 A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.

centrality.path.args, point.path.args
 A list of additional aesthetic arguments passed on to geom_path connecting raw data points and mean points.

point.args
 A list of additional aesthetic arguments to be passed to the geom_point displaying the raw data.

point.path, centrality.path
 Logical that decides whether individual data points and means, respectively, should be connected using geom_path. Both default to TRUE. Note that point.path argument is relevant only when there are two groups (i.e., in case of a t-test). In case of large number of data points, it is advisable to set point.path = FALSE as these lines can overwhelm the plot.

outlier.tagging
 Decides whether outliers should be tagged (Default: FALSE).

outlier.label
 Label to put on the outliers that have been tagged. This can’t be the same as x argument.

outlier.coef
 Coefficient for outlier detection using Tukey’s method. With Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).
outlier.label.args
A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

boxplot.args
A list of additional aesthetic arguments passed on to geom_boxplot.

violin.args
A list of additional aesthetic arguments to be passed to the geom_violin.

ggsignif.args
A list of additional aesthetic arguments to be passed to ggsignif::geom_signif.

ggtheme
A ggplot theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

package
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

palette
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggplot.component
A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.

output
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

grouped_ggbarstats  Grouped bar charts with statistical tests

Description

Helper function for ggstatsplot::ggbarstats to apply this function across multiple levels of a
given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

grouped_ggbarstats(
  data,
  ..., grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)

Arguments

data  A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.

...  Arguments passed on to ggbarstats

xlab  Custom text for the x axis label (Default: NULL, which will cause the x axis label to be the x variable).

ylab  Custom text for the y axis label (Default: NULL).

x  The variable to use as the rows in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.
y  The variable to use as the columns in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for ggbarstats function.

counts  A string naming a variable in data containing counts, or NULL if each row represents a single observation.

type  A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.

paired  Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar’s test expression will be returned. If FALSE, Pearson’s chi-square test will be returned.

results.subtitle  Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

label  Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

label.args  Additional aesthetic arguments that will be passed to geom_label.

k  Number of digits after decimal point (should be an integer) (Default: \( k = 2 \)).

proportion.test  Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to results.subtitle. In ggbarstats, only \( p \)-values from this test will be displayed.

perc.k  Numeric that decides number of decimal places for percentage labels (Default: \( 0 \)).

bf.message  Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

ratio  A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be \( \text{ratio} = c(0.5, 0.5) \) or if there are four levels this will be \( \text{ratio} = c(0.25, 0.25, 0.25, 0.25) \), etc.

conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95\% confidence/credible intervals (0.95).

sampling.plan  Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

fixed.margin  For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".
prior.concentration  Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey’s (1974) “a” parameter.

subtitle  The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption  The text for the plot caption.

legend.title  Title text for the legend.

ggtheme  A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

package  Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

palette  Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggplot.component  A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

grouping.var  A single grouping variable.

output  Character that describes what is to be returned: can be ”plot” (default) or ”subtitle” or ”caption”. Setting this to ”subtitle” will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to ”caption” will return the expression containing details about Bayes Factor analysis, but valid only when type = ”parametric” and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args  A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args  A list of additional arguments passed to patchwork::plot_annotation.

)

---

**grouped_ggbetweenstats**

_Violin plots for group or condition comparisons in between-subjects designs repeated across all levels of a grouping variable._

**Description**

Helper function for `ggstatsplot::ggbetweenstats` to apply this function across multiple levels of a given factor and combining the resulting plots using `ggstatsplot::combine_plots`.

**Usage**

```r
grouped_ggbetweenstats(
data, 
..., 
grouping.var, 
output = "plot", 
plotgrid.args = list(), 
annotation.args = list()
)
```

**Arguments**

- `data` A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.
- `...` Arguments passed on to `ggbetweenstats`
- `plot.type` Character describing the _type_ of plot. Currently supported plots are "box" (for only boxplots), "violin" (for only violin plots), and "boxviolin" (for a combination of box and violin plots; default).
- `xlab` Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.
ylab: Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

pairwise.comparisons: Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

p.adjust.method: Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

epairwise.display: Decides which pairwise comparisons to display. Available options are:
- "significant" (abbreviation accepted: "s")
- "non-significant" (abbreviation accepted: "ns")
- "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

bf.prior: A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors.

bf.message: Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle: Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

caption: The text for the plot caption.

outlier.color: Default aesthetics for outliers (Default: "black").

outlier.tagging: Decides whether outliers should be tagged (Default: FALSE).

outlier.label: Label to put on the outliers that have been tagged. This can’t be the same as x argument.

outlier.shape: Hiding the outliers can be achieved by setting outlier.shape = NA. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

outlier.label.args: A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

outlier.coef: Coefficient for outlier detection using Tukey’s method. With Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).

centrality.plotting: Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function
decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using `centrality.type` argument.

`centrality.type` Decides which centrality parameter is to be displayed. The default is to choose the same as `type` argument. You can specify this to be:

- "parametric" (for **mean**)
- "nonparametric" (for **median**)
- robust (for **trimmed mean**)
- bayes (for **MAP estimator**)

Just as `type` argument, abbreviations are also accepted.

`point.args` A list of additional aesthetic arguments to be passed to the `geom_point` displaying the raw data.

`violin.args` A list of additional aesthetic arguments to be passed to the `geom_violin`.

`ggplot.component` A `ggplot` component to be added to the plot prepared by `{ggstatsplot}`. This argument is primarily helpful for grouped variants of all primary functions. Default is NULL. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.

`package` Name of the package from which the given palette is to be extracted.

The available palettes and packages can be checked by running `View(paletteer::palettes_d_names)`.

`palette` Name of the package from which the given palette is to be extracted.

The available palettes and packages can be checked by running `View(paletteer::palettes_d_names)`.

`centrality.point.args` A list of additional aesthetic arguments to be passed to `geom_point` and `ggrepel::geom_label_repel` geoms, which are involved in mean plotting.

`centrality.label.args` A list of additional aesthetic arguments to be passed to `geom_point` and `ggrepel::geom_label_repel` geoms, which are involved in mean plotting.

`ggsignif.args` A list of additional aesthetic arguments to be passed to `ggsignif::geom_signif`.

`ggtheme` A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`. Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()`, etc.).

`x` The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if `subject.id` argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in `x` and there are `NAs` present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

`y` The response (or outcome or dependent) variable from the dataframe data.
type A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"
You can specify just the initial letter.

effsize.type Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

var.equal a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

nboot Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

  library(ggplot2)

  # the most basic function call
grouped_ggcorrmat

Visualization of a correlalogram (or correlation matrix) for all levels of a grouping variable

Description

 Helper function for ggstatsplot::ggcorrmat to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

  grouped_ggcorrmat(  
    data,  
    ...,  
    grouping.var,  
    output = "plot",  
    plotgrid.args = list(),  
    annotation.args = list()  
  )

Arguments

data Dataframe from which variables specified are preferentially to be taken.

... Arguments passed on to ggcorrmat

```r
grouped_ggbetweenstats(
  data = filter(ggplot2::mpg, drv != "4"),
  x = year,
  y = hwy,
  grouping.var = drv
)

# modifying individual plots using 'ggplot.component' argument
grouped_ggbetweenstats(
  data = filter(
    movies_long,
    genre %in% c("Action", "Comedy"),
    mpaa %in% c("R", "PG")
  ),
  x = genre,
  y = rating,
  grouping.var = mpaa,
  ggplot.component = scale_y_continuous(
    breaks = seq(1, 9, 1),
    limits = (c(1, 9))
  )
)
```
cor.vars List of variables for which the correlation matrix is to be computed and visualized. If NULL (default), all numeric variables from data will be used.

cor.vars.names Optional list of names to be used for cor.vars. The names should be entered in the same order.

partial Can be TRUE for partial correlations. For Bayesian partial correlations, "full" instead of pseudo-Bayesian partial correlations (i.e., Bayesian correlation based on frequentist partialization) are returned.

matrix.type Character, "upper" (default), "lower", or "full", display full matrix, lower triangular or upper triangular matrix.

sig.level Significance level (Default: 0.05). If the p-value in p-value matrix is bigger than sig.level, then the corresponding correlation coefficient is regarded as insignificant and flagged as such in the plot. Relevant only when output = "plot".

colors A vector of 3 colors for low, mid, and high correlation values. If set to NULL, manual specification of colors will be turned off and 3 colors from the specified palette from package will be selected.

pch Decides the point shape to be used for insignificant correlation coefficients (only valid when insig = "pch"). Default: pch = "cross".

ggcorrplot.args A list of additional (mostly aesthetic) arguments that will be passed to ggrepplot::ggcorrplot function. The list should avoid any of the following arguments since they are already internally being used: corr, method, p.mat, sig.level, ggtheme, colors, lab, pch, legend.title, digits.

type A character specifying the type of statistical approach:
  - "parametric"
  - "nonparametric"
  - "robust"
  - "bayes"

You can specify just the initial letter.

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

p.adjust.method Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".
**grouped_ggcorrmat**

- **package** Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running `View(paletteer:::palettes_d_names)`.
- **palette** Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running `View(paletteer:::palettes_d_names)`.
- **ggtheme** A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`. Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()`, etc.).
- **ggplot.component** A `ggplot` component to be added to the plot prepared by `{ggstatsplot}`. This argument is primarily helpful for grouped variants of all primary functions. Default is `NULL`. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.
- **subtitle** The text for the plot subtitle. Will work only if `results.subtitle = FALSE`.
- **caption** The text for the plot caption.
- **grouping.var** A single grouping variable.
- **output** Character that decides expected output from this function. If "plot", the visualization matrix will be returned. If "dataframe" (or literally anything other than "plot"), a dataframe containing all details from statistical analyses (e.g., correlation coefficients, statistic values, p-values, no. of observations, etc.) will be returned.
- **plotgrid.args** A list of additional arguments passed to `patchwork::wrap_plots`, except for `guides` argument which is already separately specified here.
- **annotation.args** A list of additional arguments passed to `patchwork::plot_annotation`.

**Details**

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggcorrmat.html

**See Also**

- `ggcorrmat`, `ggscatterstats`, `grouped_ggscatterstats`

**Examples**

```r
# for reproducibility
set.seed(123)
library(ggstatsplot)

# for plot
if (require("ggcorrplot")) {
  grouped_ggcorrmat(
    data = iris,
    grouping.var = Species,
    type = "robust",
```
```
grouped_ggdotplotstats

Grouped histograms for distribution of a labeled numeric variable

Description

Helper function for ggstatsplot::ggdotplotstats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

```r
grouped_ggdotplotstats(
  data, 
  ..., 
  grouping.var, 
  output = "plot", 
  plotgrid.args = list(), 
  annotation.args = list() 
)
```

Arguments

- **data**
  A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.
- **...**
  Arguments passed on to `ggdotplotstats`
- **y**
  Label or grouping variable.
- **point.args**
  A list of additional aesthetic arguments passed to `geom_point`.
- **x**
  A numeric variable from the dataframe data.
- **xlab**
  Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.
- **subtitle**
  The text for the plot subtitle. Will work only if `results.subtitle` = FALSE.
caption  The text for the plot caption.
type  A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.
test.value  A number indicating the true value of the mean (Default: 0).
bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to \( r \) scale values of 1/2, \( \sqrt{2} \)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.
bf.message  Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).
effsize.type  Type of effect size needed for parametric tests. The argument can be "d" (for Cohen's \( d \)) or "g" (for Hedge's \( g \)).
conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
tr  Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
k  Number of digits after decimal point (should be an integer) (Default: \( k = 2 \)).
results.subtitle  Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.
centrality.plotting  Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.
  • mean for parametric statistics
  • median for non-parametric statistics
  • trimmed mean for robust statistics
  • MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.
centrality.type  Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:
  • "parametric" (for mean)
  • "nonparametric" (for median)
  • robust (for trimmed mean)
  • bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.
centrality.line.args  A list of additional aesthetic arguments to be passed to the geom_line used to display the lines corresponding to the centrality parameter.

ggplot.component  A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.

ggtheme  A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

ylab  Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

grouping.var  A single grouping variable.

output  Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args  A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args  A list of additional arguments passed to patchwork::plot_annotation.

Details

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggdotplotstats.html

grouped_gghistostats, ggdotplotstats, gghistostats

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)

# removing factor level with very few no. of observations
df <- filter(ggplot2::mpg, cyl %in% c("4", "6", "8"))

# plot
grouped_ggdotplotstats(
  data = df,
  x = cty,
grouped_gghistostats

```r
y = manufacturer,
grouping.var = cyl,
test.value = 15.5
```

---

**grouped_gghistostats**  
*Grouped histograms for distribution of a numeric variable*

---

**Description**

Helper function for `ggstatsplot::gghistostats` to apply this function across multiple levels of a given factor and combining the resulting plots using `ggstatsplot::combine_plots`.

**Usage**

```r
grouped_gghistostats(
data,  
x,  
grouping.var,  
binwidth = NULL,  
output = "plot",  
plotgrid.args = list(),  
annotation.args = list(),  
...  
)
```

**Arguments**

- `data`  
  A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will **not** be accepted.

- `x`  
  A numeric variable from the dataframe `data`.

- `grouping.var`  
  A single grouping variable.

- `binwidth`  
  The width of the histogram bins. Can be specified as a numeric value, or a function that calculates width from `x`. The default is to use the `\max(x) - \min(x) / \sqrt(N)` function. You should always check this value and explore multiple widths to find the best to illustrate the stories in your data.

- `output`  
  Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a NULL.

- `plotgrid.args`  
  A list of additional arguments passed to `patchwork::wrap_plots`, except for `guides` argument which is already separately specified here.
annotation.args
A list of additional arguments passed to patchwork::plot_annotation.

Arguments passed on to **gghistostats**

normal.curve A logical value that decides whether to super-impose a normal curve using stats::dnorm(mean(x),sd(x)). Default is FALSE.

normal.curve.args A list of additional aesthetic arguments to be passed to the normal curve.

bin.args A list of additional aesthetic arguments to be passed to the stat_bin used to display the bins. Do not specify binwidth argument in this list since it has already been specified using the dedicated argument.

centrality.line.args A list of additional aesthetic arguments to be passed to the geom_line used to display the lines corresponding to the centrality parameter.

type A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

test.value A number indicating the true value of the mean (Default: 0).

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

effsize.type Type of effect size needed for *parametric* tests. The argument can be "d" (for Cohen’s d) or "g" (for Hedge’s g).

cnf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

xlab Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for *parametric* test (Default: TRUE).

ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).
results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

• mean for parametric statistics
• median for non-parametric statistics
• trimmed mean for robust statistics
• MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

• "parametric" (for mean)
• "nonparametric" (for median)
• robust (for trimmed mean)
• bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

ggplot.component A ggplot component to be added to the plot prepared by {ggstatsplot}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a (ggplot2) function or a list of (ggplot2) functions.

gghistostats, ggdotplotstats, grouped_ggdotplotstats

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)

# plot
grouped_gghistostats(  
data = iris,  
x = Sepal.Length,  
test.value = 5,  
plotgrid.args = list(nrow = 1),
grouped_ggpiestats

Grouped pie charts with statistical tests

Description
Helper function for ggstatsplot::ggpiestats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage
grouped_ggpiestats(
data,
...,
grouping.var,
output = "plot",
plotgrid.args = list(),
annotation.args = list()
)

Arguments
data
A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

... Arguments passed on to ggpiestats

x The variable to use as the rows in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.

y The variable to use as the columns in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for ggbarstats function.

proportion.test Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to results.subtitle. In ggbarstats, only p-values from this test will be displayed.

perc.k Numeric that decides number of decimal places for percentage labels (Default: 0L).

label Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

label.args Additional aesthetic arguments that will be passed to geom_label.

label.repel Whether labels should be repelled using ggrepel package. This can be helpful in case the labels are overlapping.
legend.title  Title text for the legend.
type  A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

  You can specify just the initial letter.
results.subtitle  Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.
k  Number of digits after decimal point (should be an integer) (Default: k = 2L).
bf.message  Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).
conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
subtitle  The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption  The text for the plot caption.
ggtheme  A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot().

  Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).
package  Name of the package from which the given palette is to be extracted.

  The available palettes and packages can be checked by running View(paletteer::palettes_d_names)
palette  Name of the package from which the given palette is to be extracted.

  The available palettes and packages can be checked by running View(paletteer::palettes_d_names)
ggplot.component  A \ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.
counts  A string naming a variable in data containing counts, or NULL if each row represents a single observation.
paired  Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test expression will be returned. If FALSE, Pearson's chi-square test will be returned.
ratio  A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5, 0.5) or if there are four levels this will be ratio = c(0.25, 0.25, 0.25, 0.25), etc.
sampling.plan  Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see \BayesFactor::contingencyTab
fixed.margin For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

prior.concentration Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

```

grouped_ggscatterstats

*Scatterplot with marginal distributions for all levels of a grouping variable*

Description

Grouped scatterplots from (ggplot2) combined with marginal distribution plots with statistical details added as a subtitle.
Usage

grouped_ggscatterstats(
  data,
  ...,  
  grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.

... Arguments passed on to ggscatterstats

label.var Variable to use for points labels entered as a symbol (e.g., var1).
label.expression An expression evaluating to a logical vector that determines the subset of data points to label (e.g., \(y < 4 \& z < 20\)). While using this argument with purrr::pmap, you will have to provide a quoted expression (e.g., quote(y < 4 \& z < 20)).

point.label.args A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel geom used to display the labels.
smooth.line.args A list of additional aesthetic arguments to be passed to geom_smooth geom used to display the regression line.
point.args A list of additional aesthetic arguments to be passed to geom_point geom used to display the raw data points.
marginal Decides whether marginal distributions will be plotted on axes using ggside functions. The default is TRUE. The package ggside must already be installed by the user.

point.width.jitter Degree of jitter in x and y direction, respectively. Defaults to 0 (0%) of the resolution of the data. Note that the jitter should not be specified in the point.args because this information will be passed to two different geoms: one displaying the points and the other displaying the *labels* for these points.

point.height.jitter Degree of jitter in x and y direction, respectively. Defaults to 0 (0%) of the resolution of the data. Note that the jitter should not be specified in the point.args because this information will be passed to two different geoms: one displaying the points and the other displaying the *labels* for these points.

xfill Character describing color fill for x and y axes marginal distributions (default: "#009E73" (for x) and "#D55E00" (for y)). Note that the defaults are colorblind-friendly.

yfill Character describing color fill for x and y axes marginal distributions (default: "#009E73" (for x) and "#D55E00" (for y)). Note that the defaults are colorblind-friendly.

xsidehistogram.args A list of arguments passed to respective geom_s from ggside package to change the marginal distribution histograms plots.
ysidehistogram.args A list of arguments passed to respective geom_s from ggside package to change the marginal distribution histograms plots.

x The column in data containing the explanatory variable to be plotted on the x-axis.

y The column in data containing the response (outcome) variable to be plotted on the y-axis.

type A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

xlab Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

ylab Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption.

ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

ggplot.component A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.
grouped_ggscatterstats

The `grouped_ggscatterstats` function in the `ggstatsplot` package is used to create ggplot2 plots with multiple groups. Here's a summary of its key arguments:

- `grouping.var`: A single grouping variable.
- `output`: A character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a NULL.
- `plotgrid.args`: A list of additional arguments passed to `patchwork::wrap_plots`, except for `guides` argument which is already separately specified here.
- `annotation.args`: A list of additional arguments passed to `patchwork::plot_annotation`.

### Details

For details, see: [https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggscatterstats.html](https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggscatterstats.html)

### See Also

- `ggscatterstats`, `ggcorrmat`, `grouped_ggcorrmat`

### Examples

```r
# to ensure reproducibility
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)
library(ggplot2)

# basic function call
grouped_ggscatterstats(
  data = filter(movies_long, genre == "Comedy" | genre == "Drama"),
  x = length,
  y = rating,
  type = "robust",
  grouping.var = genre,
  ggplot.component = list(geom_rug(sides = "b"))
)

# using labeling
# (also show how to modify basic plot from within function call)
grouped_ggscatterstats(
  data = filter(ggplot2::mpg, cyl != 5),
  x = displ,
  y = hwy,
  grouping.var = cyl,
  type = "robust",
  label.var = manufacturer,
  label.expression = hwy > 25 & displ > 2.5,
  ggplot.component = scale_y_continuous(sec.axis = dup_axis())
)
```
### grouped_ggwithinstats

Violin plots for group or condition comparisons in within-subjects designs repeated across all levels of a grouping variable.

**Description**

A combined plot of comparison plot created for levels of a grouping variable.

**Usage**

```r
grouped_ggwithinstats(  
data,  
...,  
grouping.var,  
output = "plot",  
plotgrid.args = list(),  
annotation.args = list()  
)
```

**Arguments**

- `data`: A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will **not** be accepted.
- `...`: Arguments passed on to `ggwithinstats`
- `point.path`: Logical that decides whether individual data points and means, respectively, should be connected using `geom_path`. Both default to TRUE. Note that `point.path` argument is relevant only when there are two groups (i.e., in case of a t-test). In case of large number of data points, it is advisable to set `point.path = FALSE` as these lines can overwhelm the plot.
- `centrality.path`: Logical that decides whether individual data points and means, respectively, should be connected using `geom_path`. Both default to TRUE. Note that `point.path` argument is relevant only when there are two groups (i.e., in case of a t-test). In case of large number of data points, it is advisable to set `point.path = FALSE` as these lines can overwhelm the plot.
grouped_ggwithinstats

centrality.path.args  A list of additional aesthetic arguments passed on to geom_path connecting raw data points and mean points.

point.path.args    A list of additional aesthetic arguments passed on to geom_path connecting raw data points and mean points.

boxplot.args       A list of additional aesthetic arguments passed on to geom_boxplot.

x  The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1,subject-2,...,pattern.

y  The response (or outcome or dependent) variable from the dataframe data.

type  A character specifying the type of statistical approach:
      • "parametric"
      • "nonparametric"
      • "robust"
      • "bayes"

You can specify just the initial letter.

pairwise.comparisons Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

pairwise.display  Decides which pairwise comparisons to display. Available options are:
      • "significant" (abbreviation accepted: "s")
      • "non-significant" (abbreviation accepted: "ns")
      • "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

p.adjust.method  Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

effsize.type  Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors.

bf.message  Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).
results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

xlab Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

ylab Labels for x and y axis variables. If NULL (default), variable names for x and y will be used.

caption The text for the plot caption.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

nboot Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- mean for parametric statistics
- median for non-parametric statistics
- trimmed mean for robust statistics
- MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

centrality.point.args A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.

centrality.label.args A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.

point.args A list of additional aesthetic arguments to be passed to the geom_point displaying the raw data.

outlier.tagging Decides whether outliers should be tagged (Default: FALSE).
outlier.label Label to put on the outliers that have been tagged. This can’t be the same as x argument.

outlier.coef Coefficient for outlier detection using Tukey’s method. With Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).

outlier.label.args A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

violin.args A list of additional aesthetic arguments to be passed to the geom_violin.

ggsignif.args A list of additional aesthetic arguments to be passed to ggsignif::geom_signif.

ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot().

Any of the (ggplot2) themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.).

package Name of the package from which the given palette is to be extracted.

The available palettes and packages can be checked by running View(paletteer::palettes_d_names)

palette Name of the package from which the given palette is to be extracted.

The available palettes and packages can be checked by running View(paletteer::palettes_d_names)

ggplot.component A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a (ggplot2) function or a list of (ggplot2) functions.

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

Examples

if (require("PMCMRplus")) {
  # to get reproducible results from bootstrapping
  set.seed(123)
  library(ggstostatsplot)
  library(dplyr, warn.conflicts = FALSE)
  library(ggplot2)
}
# the most basic function call
grouped_ggwithinstats(
  data = filter(bugs_long, condition %in% c("HDHF", "HDLF")),
  x = condition,
  y = desire,
  grouping.var = gender,
  type = "np", # non-parametric test
  # additional modifications for **each** plot using `ggplot2` functions
  ggplot.component = scale_y_continuous(breaks = seq(0, 10, 1), limits = c(0, 10))
)

---

**iris_long**  
*Edgar Anderson’s Iris Data in long format.*

**Description**

Edgar Anderson’s Iris Data in long format.

**Usage**

`iris_long`

**Format**

A data frame with 600 rows and 5 variables

- **id.** Dummy identity number for each flower (150 flowers in total).
- **Species.** The species are *Iris setosa*, *versicolor*, and *virginica*.
- **attribute.** What attribute is being measured ("Sepal" or "Pepal").
- **measure.** What aspect of the attribute is being measured ("Length" or "Width").
- **value.** Value of the measurement.

**Details**

This famous (Fisher’s or Anderson’s) iris data set gives the measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The species are Iris setosa, versicolor, and virginica.

This is a modified dataset from datasets package.

**Examples**

```r
dim(iris_long)
head(iris_long)
dplyr::glimpse(iris_long)
```
**movies_long**

*Movie information and user ratings from IMDB.com (long format).*

**Description**

Movie information and user ratings from IMDB.com (long format).

**Usage**

`movies_long`

**Format**

A data frame with 1,579 rows and 8 variables

- `title`. Title of the movie.
- `year`. Year of release.
- `budget`. Total budget (if known) in US dollars
- `length`. Length in minutes.
- `rating`. Average IMDB user rating.
- `votes`. Number of IMDB users who rated this movie.
- `mpaa`. MPAA rating.
- `genre`. Different genres of movies (action, animation, comedy, drama, documentary, romance, short).

**Details**

Modified dataset from ggplot2movies package.

The internet movie database, [https://imdb.com/](https://imdb.com/), is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.

**Source**

[https://CRAN.R-project.org/package=ggplot2movies](https://CRAN.R-project.org/package=ggplot2movies)

**Examples**

```r
dim(movies_long)
head(movies_long)
dplyr::glimpse(movies_long)
```
pairwise_comparisons  Multiple pairwise comparison tests with tidy data

Description

Calculate parametric, non-parametric, robust, and Bayes Factor pairwise comparisons between group levels with corrections for multiple testing.

Usage

pairwise_comparisons(
  data,  
  x, 
  y,
  subject.id = NULL, 
  type = "parametric", 
  paired = FALSE, 
  var.equal = FALSE, 
  tr = 0.2, 
  bf.prior = 0.707, 
  p.adjust.method = "holm", 
  k = 2L,
  ...
)

Arguments

data  A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

x  The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

y  The response (or outcome or dependent) variable from the dataframe data.

subject.id  Relevant in case of a repeated measures or within-subjects design (paired = TRUE, i.e.), it specifies the subject or repeated measures identifier. Important: Note that if this argument is NULL (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate when there are more than two levels in x and there are NAs present.

type  A character specifying the type of statistical approach:
pairwise_comparisons

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

**paired** Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.

**var.equal** a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

**tr** Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

**bf.prior** A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

**p.adjust.method** Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

**k** Number of digits after decimal point (should be an integer) (Default: k = 2L).

**...** Additional arguments passed to other methods.

**Value**

A tibble dataframe containing two columns corresponding to group levels being compared with each other (group1 and group2) and p.value column corresponding to this comparison. The dataframe will also contain a p.value.label column containing a label for this p-value, in case this needs to be displayed in ggplot2::geom_ggsignif. In addition to these common columns across the different types of statistics, there will be additional columns specific to the type of test being run.

This function provides a unified syntax to carry out pairwise comparison tests and internally relies on other packages to carry out these tests. For more details about the included tests, see the documentation for the respective functions:

- **parametric**: stats::pairwise.t.test() (paired) and PMCMRplus::gamesHowellTest() (unpaired)
- **non-parametric**: PMCMRplus::durbinAllPairsTest() (paired) and PMCMRplus::kwAllPairsDunnTest() (unpaired)
- **robust**: WRS2::rmmcp() (paired) and WRS2::lincon() (unpaired)
- **Bayes Factor**: BayesFactor::ttestBF()

theme_ggstatsplot  Default theme used in {ggstatsplot}

Description

Common theme used across all plots generated in {ggstatsplot} and assumed by the author to be aesthetically pleasing to the user/reader. The theme is a wrapper around theme_bw().

Usage

theme_ggstatsplot()

Value

A ggplot object with the theme_ggstatsplot theme overlaid.

Examples

library(ggplot2)
library(ggstatsplot)

ggplot(mtcars, aes(wt, mpg)) +
  geom_point() +
  theme_ggstatsplot()

Titanic_full  Titanic dataset.

Description

Titanic dataset.

Usage

Titanic_full
**Titanic_full**

**Format**

A data frame with 2201 rows and 5 variables

- **id.** Dummy identity number for each person.
- **Class.** 1st, 2nd, 3rd, Crew.
- **Sex.** Male, Female.
- **Age.** Child, Adult.
- **Survived.** No, Yes.

**Details**

This data set provides information on the fate of passengers on the fatal maiden voyage of the ocean liner 'Titanic', summarized according to economic status (class), sex, age and survival.

This is a modified dataset from datasets package.

**Examples**

```r
dim(Titanic_full)
head(Titanic_full)
dplyr::glimpse(Titanic_full)
```
