Package ‘imputeTS’

January 16, 2021

Version 3.2
Date 2021-01-16
Title Time Series Missing Value Imputation
Description Imputation (replacement) of missing values in univariate time series.
Offers several imputation functions and missing data plots.
Available imputation algorithms include:

ggplot_na_distribution

Visualize the Distribution of Missing Values

Description

Visualize the distribution of missing values within a time series.
Usage

ggplot_na_distribution(
  x,
  x_axis_labels = NULL,
  color_points = "steelblue",
  color_lines = "steelblue2",
  color_missing = "indianred",
  color_missing_border = "indianred",
  alpha_missing = 0.5,
  title = "Distribution of Missing Values",
  subtitle = "Time Series with highlighted missing regions",
  xlab = "Time",
  ylab = "Value",
  shape_points = 20,
  size_points = 2.5,
  theme = ggplot2::theme_linedraw()
)

Arguments

x      Numeric Vector (vector) or Time Series (ts) object containing NAs. This is the only mandatory parameter - all other parameters are only needed for adjusting the plot appearance.
x_axis_labels  For adding specific x-axis labels. Takes a vector of Date or POSIXct objects as an input (needs the same length as x). The Default (NULL) uses the observation numbers as x-axis tick labels.
color_points  Color for the Symbols/Points.
color_lines   Color for the Lines.
color_missing Color used for highlighting the time spans with NA values.
color_missing_border  Color used as border for time spans with NA values.
alpha_missing Transparencity value used for color_missing.
title        Title of the Plot (NULL for deactivating title).
subtitle     Subtitle of the Plot (NULL for deactivating subtitle).
xlab         Label for x-Axis.
ylab         Label for y-Axis.
shape_points Symbol to use for the Observations/Points. See https://ggplot2.tidyverse.org/articles/ggplot2-specs.html as reference.
size_points  Size of Symbols/Points.
theme        Set a Theme for ggplot2. Default is ggplot2::theme_linedraw(). (theme_linedraw)

Details

This function visualizes the distribution of missing values within a time series. If a value is NA, the background is colored differently. This gives a good overview of where most missing values occur.
The only really needed parameter for this function is \( x \) (the univariate time series that shall be visualized). All other parameters are solely for altering the appearance of the plot.

As long as the input is univariate and numeric the function also takes data.frame, tibble, tsibble, zoo, xts as an input.

The plot can be adjusted to your needs via the function parameters. Additionally for more complex adjustments, the output can also be adjusted via ggplot2 syntax. This is possible, since the output of the function is a ggplot2 object. Also take a look at the Examples to see how adjustments are made.

For very long time series it might happen, that the plot gets too crowded and overplotting issues occur. In this case the \texttt{ggplot_na_intervals} plotting function can provide a more condensed overview.

**Examples**

```r
# Example 1: Visualize the missing values in x
x <- stats::ts(c(1:11, 4:9, NA, NA, NA, 11:15, 7:15, 15:6, NA, NA, 2:5, 3:7))
ggplot_na_distribution(x)

# Example 2: Visualize the missing values in tsAirgap time series
ggplot_na_distribution(tsAirgap)

# Example 3: Same as example 1, just written with pipe operator
x <- ts(c(1:11, 4:9, NA, NA, NA, 11:15, 7:15, 15:6, NA, NA, 2:5, 3:7))
x %>% ggplot_na_distribution()

# Example 4: Visualize NAs in tsAirgap - different color for points
# Plot adjustments via \texttt{ggplot_na_distribution} function parameters
ggplot_na_distribution(tsAirgap, color_points = "grey")

# Example 5: Visualize NAs in tsAirgap - different theme
# Plot adjustments via \texttt{ggplot_na_distribution} function parameters
ggplot_na_distribution(tsAirgap, theme = ggplot2::theme_classic())

# Example 6: Visualize NAs in tsAirgap - title, subtitle in center
# Plot adjustments via \texttt{ggplot2} syntax
ggplot_na_distribution(tsAirgap) +
ggplot2::theme(plot.title = ggplot2::element_text(hjust = 0.5)) +
ggplot2::theme(plot.subtitle = ggplot2::element_text(hjust = 0.5))

# Example 7: Visualize NAs in tsAirgap - title in center, no subtitle
# Plot adjustments via \texttt{ggplot2} syntax and function parameters
ggplot_na_distribution(tsAirgap, subtitle = NULL) +
ggplot2::theme(plot.title = ggplot2::element_text(hjust = 0.5))
```

# Example 8: Visualize NAs in tsAirgap - x-axis texts with angle
# Plot adjustments via ggplot2 syntax and function parameters
ggplot_na_distribution(tsAirgap, color_points = "grey") +
ggplot2::theme(axis.text.x = ggplot2::element_text(angle = 60, hjust = 1))

---

## ggplot_na_gapsize

**Visualize Occurrences of NA gap sizes**

### Description

Visualize the Number of Occurrences for existing NA Gap Sizes (NAs in a row) in a Time Series

### Usage

```r
ggplot_na_gapsize(
  x,
  limit = 10,
  include_total = TRUE,
  ranked_by = "occurrence",
  color_occurrence = "indianred",
  color_total = "steelblue",
  title = "Occurrence of gap sizes",
  subtitle = "Gap sizes (NAs in a row) ordered by most common",
  xlab = NULL,
  ylab = "Number occurrence",
  legend = TRUE,
  orientation = "horizontal",
  label_occurrence = "Number occurrence gapsize",
  label_total = "Resulting NAs for gapsize",
  theme = ggplot2::theme_linedraw()
)
```

### Arguments

- **x**
  Numeric Vector (`vector`) or Time Series (`ts`) object containing NAs. This is the only mandatory parameter - all other parameters are only needed for adjusting the plot appearance.

- **limit**
  Specifies how many of the most common gap sizes are shown in the plot. Default is 10. So only the 10 most often occurring gap sizes will be shown. If more or all present gap sizes should be displayed, the limit needs to be increased. Since this might add a lot of additional data, having parameter `orientation` set to "horizontal" avoids overlaps in the axis labels.

- **include_total**
  When set to `TRUE` the total NA count for a gapsize is included in the plot (total = number occurrence x gap size). E.g. if a gapsize of 3 occurs 10 times, this means this gap size makes up for 30 NAs in total. This can be a good indicator of the overall impact of a gapsize.
ranked_by

Should the results be sorted according to the number of occurrence or total resulting NAs for a gapsize. Total resulting NAs are calculated by (total = number occurrence x gap size).

- "occurrence" - Sorting by 'number of occurrence' of a gap size
- "total" - Sorting by 'total resulting NAs' of a gap size

The default setting is "occurrence".

color_occurrence

Defines the Color for the Bars of 'number of occurrence'.

color_total

Defines the color for the bars of 'total resulting NAs'.

title

Title of the Plot.

subtitle

Subtitle of the Plot.

xlab

Label for x-Axis.

ylab

Label for y-Axis.

legend

If TRUE a legend is added at the bottom.

orientation

Can be either 'vertical' or 'horizontal'. Defines if the bars are plotted vertically or horizontally. For large amounts of different gap sizes horizontal illustration is favorable (also see parameter limit).

label_occurrence

Defines the label assigned to 'number of occurrence' in the legend.

label_total

Defines the label assigned to 'total resulting NAs' in the legend.

theme

Set a Theme for ggplot2. Default is ggplot2::theme_linedraw(). (theme_linedraw)

Details

This plotting function can be used to visualize the length of the NA gaps (NAs in a row) in a time series. It shows a ranking of which gap sizes occur most often. This ranking can be ordered by the number occurrence of the gap sizes or by total resulting NAs for this gap size (occurrence * gap length). A NA-gap of 3 occurring 10 times means 30 total resulting NAs.

A resulting plot can for example be described like this: a 2 NA-gap (2 NAs in a row) occurred 27 times, a 9 NA-gap (9 NAs in a row) occurred 11 times, a 27 NA-gap (27 NAs in a row) occurred 1 times, ...

The only really needed parameter for this function is x (the univariate time series with NAs that shall be visualized). All other parameters are solely for altering the appearance of the plot.

As long as the input is univariate and numeric the function also takes data.frame, tibble, tsibble, zoo, xts as an input.

The plot can be adjusted to your needs via the function parameters. Additionally for more complex adjustments, the output can also be adjusted via ggplot2 syntax. This is possible, since the output of the function is a ggplot2 object. Also take a look at the Examples to see how adjustments are made.

Value

The output is a ggplot2 object that can be further adjusted by using the ggplot syntax.

**Examples**

```r
# Example 1: Visualize the top gap sizes in tsNH4 (top 10 by default)
ggplot_na_gapsize(tsNH4)

# Example 2: Visualize the top gap sizes in tsAirgap - horizontal bars
ggplot_na_gapsize(tsAirgap, orientation = "vertical")

# Example 3: Same as example 1, just written with pipe operator
tsNH4 %>% ggplot_na_gapsize()

# Example 4: Visualize the top 20 gap sizes in tsNH4
ggplot_na_gapsize(tsNH4, limit = 20)

# Example 5: Visualize top gap sizes in tsNH4 without showing total NAs
# (total = occurrence * gap length)
ggplot_na_gapsize(tsNH4, limit = 20, include_total = FALSE)

# Example 6: Visualize top gap sizes in tsNH4 but ordered by total NAs
# Plot adjustments via ggplot_na_gapsize function parameters
ggplot_na_gapsize(tsNH4, limit = 20, ranked_by = "total")

# Example 7: Visualize top gap sizes in tsNH4 - different theme
# Plot adjustments via ggplot_na_gapsize function parameters
ggplot_na_gapsize(tsNH4, theme = ggplot2::theme_classic())

# Example 8: Visualize top gap sizes in tsNH4 - title, subtitle in center
# Plot adjustments via ggplot2 syntax
ggplot_na_gapsize(tsNH4) +
  ggplot2::theme(plot.title = ggplot2::element_text(hjust = 0.5)) +
  ggplot2::theme(plot.subtitle = ggplot2::element_text(hjust = 0.5))

# Example 9: Visualize top gap sizes in tsNH4 - title in center, no subtitle
# Plot adjustments via ggplot2 syntax and function parameters
ggplot_na_gapsize(tsNH4, subtitle = NULL) +
  ggplot2::theme(plot.title = ggplot2::element_text(hjust = 0.5))

# Example 10: Top gap sizes in tsNH4 - legend on the right and color change
# Plot adjustments via ggplot2 syntax and function parameters
ggplot_na_gapsize(tsNH4, color_total = "grey") +
  ggplot2::theme(legend.position = "right")
```
ggplot_na_imputations  
Visualize Imputed Values

Description

Visualize the imputed values in a time series.

Usage

ggplot_na_imputations(
  x_with_na,
  x_with_imputations,
  x_with_truth = NULL,
  x_axis_labels = NULL,
  title = "Imputed Values",
  subtitle = "Visualization of missing value replacements",
  xlab = "Time",
  ylab = "Value",
  color_points = "steelblue",
  color_imputations = "indianred",
  color_truth = "seagreen3",
  color_lines = "lightslategray",
  shape_points = 16,
  shape_imputations = 18,
  shape_truth = 16,
  size_points = 1.5,
  size_imputations = 2.5,
  size_truth = 1.5,
  size_lines = 0.5,
  linetype = "solid",
  connect_na = TRUE,
  legend = TRUE,
  legend_size = 5,
  label_known = "known values",
  label_imputations = "imputed values",
  label_truth = "ground truth",
  theme = ggplot2::theme_linedraw()
)

Arguments

x_with_na  Numeric Vector or Time Series (ts) object with NAs before imputation. This parameter and x_with_imputation shave to be set. The rest of the parameters are mostly needed for adjusting the plot appearance.
x_with_imputations
Numeric Vector or Time Series (ts) object with NAs replaced by imputed values. This parameter and x_with_imputation should be set. The rest of the parameters are mostly needed for adjusting the plot appearance.

x_with_truth
Numeric Vector or Time Series (ts) object with the real values (optional parameter). If the ground truth is known (e.g., in experiments where the missing values were artificially added) it can be displayed in the plot with this parameter. Default is NULL (ground truth not known).

x_axis_labels
For adding specific x-axis labels. Takes a vector of Date or POSIXct objects as an input (needs the same length as x_with_na). The Default (NULL) uses the observation numbers as x-axis tick labels.

title
Title of the Plot.
subtitle
Subtitle of the Plot.
xlab
Label for x-Axis.
ylab
Label for y-Axis.
color_points
Color for the Symbols/Points of the non-NA Observations.
color_imputations
Color for the Symbols/Points of the Imputed Values.
color_truth
Color for the Symbols/Points of the NA value Ground Truth (only relevant when x_with_truth available).
color_lines
Color for the Lines connecting the Observations/Points.
shape_points
Shape for the Symbols/Points of the non-NA observations. See https://ggplot2.tidyverse.org/articles/ggplot2-specs.html as reference.
shape_imputations
Shape for the Symbols/Points of the imputed values. See https://ggplot2.tidyverse.org/articles/ggplot2-specs.html as reference.
shape_truth
Shape for the Symbols/Points of the NA value Ground Truth (only relevant when x_with_truth available).
size_points
Size for the Symbols/Points of the non-NA Observations.
size_imputations
Size for the Symbols/Points of the Imputed Values.
size_truth
Size for the Symbols/Points of the NA value Ground Truth (only relevant when x_with_truth available).
size_lines
Size for the Lines connecting the Observations/Points.
linetype
Linetype for the Lines connecting the Observations/Points.
connect_na
If TRUE the Imputations are connected to the non-NA observations in the plot. Otherwise there are no connecting lines between symbols in NA areas.

legend
If TRUE a Legend is added at the bottom.
legend_size
Size of the Symbols used in the Legend.
label_known
Legend label for the non-NA Observations.
label_imputations
Legend label for the Imputed Values.
label_truth
Legend label for the Ground Truth of the NA values.
theme
Set a Theme for ggplot2. Default is ggplot2::theme_linedraw(). (theme_linedraw)
**Details**

This plot can be used to visualize imputed values for a time series. Imputed values (filled NA gaps) are shown in a different color than the other values. If real values (ground truth) for the NA gaps are known, they can be optionally added in a different color.

The only really needed parameters for this function are `x_with_na` (the time series with NAs before imputation) and `x_with_imputations` (the time series without NAs after imputation). All other parameters are mostly for altering the appearance of the plot.

As long as the input is univariate and numeric the function also takes data.frame, tibble, tsibble, zoo, xts as an input.

The plot can be adjusted to your needs via the function parameters. Additionally for more complex adjustments, the output can also be adjusted via ggplot2 syntax. This is possible, since the output of the function is a ggplot2 object. Also take a look at the Examples to see how adjustments are made.

  ggrepplot_na_imputations(x_with_na = tsAirgap)

# Example 5: Visualize imputation by na_seadec - different color for imputed points
# Plot adjustments via ggrepplot_na_imputations function parameters
imp_seadec <- na_seadec(tsAirgap)
```

ggplot_na_intervals

Visualize Missing Values per Interval

Description

Visualization of missing values in barplot form. Especially useful when looking at specific intervals and for time series with a lot of observations.

Usage

```r
ggplot_na_intervals(
x,  
number_intervals = NULL,  
interval_size = NULL,  
measure = "percent",  
color_missing = "indianred2",  
color_existing = "steelblue",  
alpha_missing = 0.8,  
```
alpha_existing = 0.3,
  subtitle = "Amount of NA and non-NA for successive intervals",
  xlab = "Time Lapse (Interval Size: XX)",
  ylab = NULL,
  color_border = "white",
  theme = ggplot2::theme_linedraw()
)

Arguments

x       Numeric Vector (vector) or Time Series (ts) object containing NAs. This is the only mandatory parameter - all other parameters are only needed for adjusting the plot appearance.

number_intervals  Defines the number of bins to be created. Default number of intervals (denoted by NULL) is calculated by nclass.Sturges using Sturges' formula. If the interval_size parameter is set to a value different to NULL this parameter is ignored.

interval_size  Defines how many observations should be in one bin/interval. The required number of overall bins is afterwards calculated automatically. If used this parameter overwrites the number_intervals parameter. For a very long time series be sure to make the interval_size not extremely small, otherwise because of overplotting issues nothing can be seen until you also increase the plot width.

measure  Whether the NA / non-NA ratio should be given as percent or absolute numbers.

• "percent" - for percentages
  • "count" - for absolute numbers of NAs

color_missing  Color for the amount of missing values.
color_existing  Color for the amount of existing values.

alpha_missing  Alpha (transparency) value for the missing values.
alpha_existing  Alpha (transparency) value for the existing values.

title  Title of the Plot (NULL for deactivating title).
subtitle  Subtitle of the Plot (NULL for deactivating subtitle).
xlab  Label for x-Axis. Automatically set to the current interval size, if no custom text is chosen.
ylab  Label for y-Axis. As default (NULL), the axis is automatically set to either 'Percent' or 'Count' dependent on the settings of parameter measure.

color_border  Color for the small borders between the intervals/bins. Default is 'white'.
theme  Set a Theme for ggplot2. Default is ggplot2::theme_linedraw() (theme_linedraw)

Details

This function visualizes the distribution of missing values within a time series. In comparison to the ggplot_na_distribution function this is not done by plotting each observation of the time
series separately. Instead observations for time intervals are represented as intervals/bins of multiple values. For these intervals information about the amount of missing values are shown. This has the advantage, that also for large time series a plot which is easy to overview can be created.

The only really needed parameter for this function is x (the univariate time series that shall be visualized). All other parameters are solely for altering the appearance of the plot.

As long as the input is univariate and numeric the function also takes data.frame, tibble, tsibble, zoo, xts as an input.

The plot can be adjusted to your needs via the function parameters. Additionally for more complex adjustments, the output can also be adjusted via ggplot2 syntax. This is possible, since the output of the function is a ggplot2 object. Also take a look at the Examples to see how adjustments are made.

na_interpolation

Missing Value Imputation by Interpolation

Description

Uses either linear, spline or stineman interpolation to replace missing values.

Usage

na_interpolation(x, option = "linear", maxgap = Inf, ...)

Arguments

x  Numeric Vector (vector) or Time Series (ts) object in which missing values shall be replaced
option  Algorithm to be used. Accepts the following input:
  • "linear" - for linear interpolation using approx (default choice)
  • "spline" - for spline interpolation using spline
  • "stine" - for Stineman interpolation using stinterp
maxgap  Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.
...
  Additional parameters to be passed through to approx or spline interpolation functions

Details

Missing values get replaced by values of a approx, spline or stinterp interpolation.

Value

Vector (vector) or Time Series (ts) object (dependent on given input at parameter x)

---

| na_kalman | Missing Value Imputation by Kalman Smoothing and State Space Models |

---

Description

Uses Kalman Smoothing on structural time series models (or on the state space representation of an arima model) for imputation.

Usage

na_kalman(x, model = "StructTS", smooth = TRUE, nit = -1, maxgap = Inf, ...)
Arguments

- **x**: Numeric Vector (`vector`) or Time Series (`ts`) object in which missing values shall be replaced.

- **model**: Model to be used. With this parameter the State Space Model (on which KalmanSmoothing is performed) can be chosen. Accepts the following input:
  - "auto.arima" - For using the state space representation of arima model (using `auto.arima`) (default choice)
  - "StructTS" - For using a structural model fitted by maximum likelihood (using `StructTS`)

For both auto.arima and StructTS additional parameters for model building can be given with the `...` parameter.

Additionally it is also possible to use a user created state space model (See code Example 5). This state space model could for example be obtained from another R package for structural time series modeling. Furthermore providing the state space representation of a arima model from `arima` is also possible. But it is important to note, that user created state space models must meet the requirements specified under `KalmanLike`. This means the user supplied state space model has to be in form of a list with at least components T, Z, h, V, a, P, Pn. (more details under `KalmanLike`)

- **smooth**: if `TRUE` - `KalmanSmooth` is used for estimation, if `FALSE` - `KalmanRun` is used. Since KalmanRun is often considered extrapolation KalmanSmooth is usually the better choice for imputation.

- **nit**: Parameter from Kalman Filtering (see `KalmanLike`). Usually no need to change from default.

- **maxgap**: Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than `maxgap` will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

  `...` Additional parameters to be passed through to the functions that build the State Space Models (`StructTS` or `auto.arima`).

Details

The KalmanSmother used in this function is `KalmanSmooth`. It operates either on a Basic Structural Model obtained by `StructTS` or the state space representation of a ARMA model obtained by `auto.arima`.

For an detailed explanation of Kalman Filtering and Space Space Models the following literature is a good starting point:

- G. Welch, G. Bishop, An Introduction to the Kalman Filter. SIGGRAPH 2001 Course 8, 1995
**Value**

Vector (vector) or Time Series (ts) object (dependent on given input at parameter x)

**na_locf**  
**Missing Value Imputation by Last Observation Carried Forward**

**Description**

Replaces each missing value with the most recent present value prior to it (Last Observation Carried Forward- LOCF). Optionally this can also be done starting from the back of the series (Next Observation Carried Backward - NOCB).

**Usage**

```r
na_locf(x, option = "locf", na_remaining = "rev", maxgap = Inf)
```
Arguments

x  Numeric Vector (vector) or Time Series (ts) object in which missing values shall be replaced

option  Algorithm to be used. Accepts the following input:
• "locf" - for Last Observation Carried Forward (default choice)
• "nocb" - for Next Observation Carried Backward

na_remaining  Method to be used for remaining NAs.
• "rev" - to perform nocb / locf from the reverse direction (default choice)
• "keep" - to return the series with NAs
• "rm" - to remove remaining NAs
• "mean" - to replace remaining NAs by overall mean

maxgap  Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

Details

General Functionality:
Replaces each missing value with the most recent present value prior to it (Last Observation Carried Forward - LOCF). This can also be done in reverse direction, starting from the end of the series (then called Next Observation Carried Backward - NOCB).

Handling for NAs at the beginning of the series:
In case one or more successive observations directly at the start of the time series are NA, there exists no 'last value' yet, that can be carried forward. Thus, no LOCF imputation can be performed for these NAs. As soon as the first non-NA value appears, LOCF can be performed as expected. The same applies to NOCB, but from the opposite direction.
While this problem might appear seldom and will only affect a very small amount of values at the beginning, it is something to consider. The na_remaining parameter helps to define, what should happen with these values at the start, that would remain NA after pure LOCF. Default setting is na_remaining = "rev", which performs nocb / locf from the other direction to fill these NAs. So a NA at the beginning will be filled with the next non-NA value appearing in the series.
With na_remaining = "keep" NAs at the beginning (that can not be imputed with pure LOCF) are just left as remaining NAs.
With na_remaining = "rm" NAs at the beginning of the series are completely removed. Thus, the time series is basically shortened.
Also available is na_remaining = "mean", which uses the overall mean of the time series to replace these remaining NAs. (but beware, mean is usually not a good imputation choice - even if it only affects the values at the beginning)

Value
Vector (vector) or Time Series (ts) object (dependent on given input at parameter x)
Author(s)
Steffen Moritz

Examples

# Prerequisite: Create Time series with missing values
x <- ts(c(NA, 3, 4, 5, 6, NA, 7, 8))

# Example 1: Perform LOCF
na_locf(x)

# Example 2: Perform NOCF
na_locf(x, option = "nocb")

# Example 3: Perform LOCF and remove remaining NAs
na_locf(x, na_remaining = "rm")

# Example 4: Same as example 1, just written with pipe operator
x %>% na_locf()

na_ma

Missing Value Imputation by Weighted Moving Average

Description
Missing value replacement by weighted moving average. Uses semi-adaptive window size to ensure all NAs are replaced.

Usage

na_ma(x, k = 4, weighting = "exponential", maxgap = Inf)

Arguments

x
Numeric Vector (vector) or Time Series (ts) object in which missing values shall be replaced

k
integer width of the moving average window. Expands to both sides of the center element e.g. k=2 means 4 observations (2 left, 2 right) are taken into account. If all observations in the current window are NA, the window size is automatically increased until there are at least 2 non-NA values present.

weighting
Weighting to be used. Accepts the following input:
- "simple" - Simple Moving Average (SMA)
- "linear" - Linear Weighted Moving Average (LWMA)
- "exponential" - Exponential Weighted Moving Average (EWMA) (default choice)

maxgap

Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

Details

In this function missing values get replaced by moving average values. Moving Averages are also sometimes referred to as "moving mean", "rolling mean", "rolling average" or "running average".

The mean in this implementation taken from an equal number of observations on either side of a central value. This means for an NA value at position i of a time series, the observations i-1,i+1 and i+1, i+2 (assuming a window size of k=2) are used to calculate the mean.

Since it can in case of long NA gaps also occur, that all values next to the central value are also NA, the algorithm has a semi-adaptive window size. Whenever there are less than 2 non-NA values in the complete window available, the window size is incrementally increased, till at least 2 non-NA values are there. In all other cases the algorithm sticks to the pre-set window size.

There are options for using Simple Moving Average (SMA), Linear Weighted Moving Average (LWMA) and Exponential Weighted Moving Average (EWMA).

SMA: all observations in the window are equally weighted for calculating the mean.

LWMA: weights decrease in arithmetical progression. The observations directly next to a central value i, have weight 1/2, the observations one further away (i-2,i+2) have weight 1/3, the next (i-3,i+3) have weight 1/4, ...

EWMA: uses weighting factors which decrease exponentially. The observations directly next to a central value i, have weight 1/2^1, the observations one further away (i-2,i+2) have weight 1/2^2, the next (i-3,i+3) have weight 1/2^3, ...

Value

Vector (vector) or Time Series (ts) object (dependent on given input at parameter x)

Examples

# Example 1: Perform imputation with simple moving average
na_ma(tsAirgap, weighting = "simple")

# Example 2: Perform imputation with exponential weighted moving average
na_ma(tsAirgap)
na_mean

# Example 3: Perform imputation with exponential weighted moving average, window size 6
na_ma(tsAirgap, k = 6)

# Example 4: Same as example 1, just written with pipe operator
tsAirgap %>% na_ma(weighting = "simple")

na_mean

### Missing Value Imputation by Mean Value

#### Description

Missing value replacement by mean values. Different means like median, mean, mode possible.

#### Usage

na_mean(x, option = "mean", maxgap = Inf)

#### Arguments

- **x**
  
  Numeric Vector (**vector**) or Time Series (**ts**) object in which missing values shall be replaced

- **option**
  
  Algorithm to be used. Accepts the following input:
  
  - "mean" - take the mean for imputation (default choice)
  - "median" - take the median for imputation
  - "mode" - take the mode for imputation
  - "harmonic" - take the harmonic mean
  - "geometric" - take the geometric mean

- **maxgap**
  
  Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than ‘maxgap’ will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

#### Details

Missing values get replaced by overall mean values. The function calculates the mean, median or mode over all the non-NA values and replaces all NAs with this value. Option ‘mode’ replaces NAs with the most frequent value in the time series. If two or more values occur equally frequent, the function imputes with the lower value. That’s why ‘mode’ is not the best option for decimal values.

#### Value

Vector (**vector**) or Time Series (**ts**) object (dependent on given input at parameter x)

#### Author(s)

Steffen Moritz

na_interpolation, na_kalman, na_locf, na_ma, na_random, na_replace, na_seadec, na_seasplit

Examples

# Prerequisite: Create Time series with missing values
x <- ts(c(2, 3, 4, 5, 6, NA, 7, 8))

# Example 1: Perform imputation with the overall mean
na_mean(x)

# Example 2: Perform imputation with overall median
na_mean(x, option = "median")

# Example 3: Same as example 1, just written with pipe operator
x %>% na_mean()

na_random

Missing Value Imputation by Random Sample

Description

Replaces each missing value by drawing a random sample between two given bounds.

Usage

na_random(x, lower_bound = NULL, upper_bound = NULL, maxgap = Inf)

Arguments

x numeric vector (vector) or time series (ts) object in which missing values shall be replaced
lower_bound lower bound for the random samples. If nothing or NULL is set min(x) will be used.
upper_bound upper bound for the random samples. If nothing or NULL is set max(x) will be used.
maxgap Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

Details

Replaces each missing value by drawing a random sample between two given bounds. The default bounds are the minimum and the maximum value in the non-NAs from the time series. Function uses runif function to get the random values.
\texttt{na_remove}

\textbf{Value}

Vector (\texttt{vector}) or Time Series (\texttt{ts}) object (dependent on given input at parameter \(x\))

\textbf{Author(s)}

Steffen Moritz

\textbf{See Also}

\texttt{na_interpolation, na_kalman, na_locf, na_ma, na_mean, na_replace, na_seadec, na_seasplit}

\textbf{Examples}

\begin{verbatim}
# Prerequisite: Create Time series with missing values
x <- ts(c(2, 3, NA, 5, 6, NA, 7, 8))

# Example 1: Replace all NAs by random values that are between min and max of the input time series
na_random(x)

# Example 2: Replace all NAs by random values between 1 and 10
na_random(x, lower_bound = 1, upper_bound = 10)

# Example 3: Same as example 1, just written with pipe operator
x %>% na_random()
\end{verbatim}

---

\textbf{Description}

Removes all missing values from a time series.

\textbf{Usage}

\texttt{na_remove(x)}

\textbf{Arguments}

\begin{itemize}
  \item \texttt{x} \hspace{1cm} Numeric Vector (\texttt{vector}) or Time Series (\texttt{ts}) object in which missing values shall be replaced
\end{itemize}

\textbf{Details}

Removes all missing values from a input time series. This shortens the time series by the number of missing values in the series. Should be handled with care, because this can affect the seasonality of the time series. Seasonal patterns might be destroyed. Independent from the input, this function only returns a vector. (the time information of a resulting time series object wouldn’t be correct any more).
Value

Vector (vector)

Author(s)

Steffen Moritz

# Create Time series with missing values
x <- ts(c(2, 3, NA, 5, 6, NA, 7, 8))

# Example 1: Remove all NAs
na_remove(x)

# Example 2: Remove all NAs in tsAirgap
na_remove(tsAirgap)

# Example 3: Same as example 1, just written with pipe operator
x %>% na_remove()

na_replace

Replace Missing Values by a Defined Value

Description

Replaces all missing values with a given value.

Usage

na_replace(x, fill = 0, maxgap = Inf)

Arguments

x Numeric Vector (vector) or Time Series (ts) object in which missing values shall be replaced
fill Value used to replace the missing values
maxgap Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.
**Value**

Vector (*vector*) or Time Series (*ts*) object (dependent on given input at parameter *x*)

**Author(s)**

Steffen Moritz

**See Also**

*na_interpolation*, *na_kalman*, *na_locf*, *na_ma*, *na_mean*, *na_random*, *na_seadec*, *na_seasplit*

**Examples**

```r
# Prerequisite: Create Time series with missing values
x <- ts(c(2, 3, NA, 5, 6, NA, 7, 8))

# Example 1: Replace all NAs with 3.5
na_replace(x, fill = 3.5)

# Example 2: Replace all NAs with 0
na_replace(x, fill = 0)

# Example 3: Same as example 1, just written with pipe operator
x %>% na_replace(fill = 3.5)
```

---

**na_seadec**

*Seasonally Decomposed Missing Value Imputation*

**Description**

Removes the seasonal component from the time series, performs imputation on the deseasonalized series and afterwards adds the seasonal component again.

**Usage**

```r
na_seadec(
  x,
  algorithm = "interpolation",
  find_frequency = FALSE,
  maxgap = Inf,
  ...
)
```
Arguments

x Numeric Vector (vector) or Time Series (ts) object in which missing values shall be replaced

algorithm Algorithm to be used after decomposition. Accepts the following input:
  • "interpolation" - Imputation by Interpolation (default choice)
  • "locf" - Imputation by Last Observation Carried Forward
  • "mean" - Imputation by Mean Value
  • "random" - Imputation by Random Sample
  • "kalman" - Imputation by Kalman Smoothing and State Space Models
  • "ma" - Imputation by Weighted Moving Average

find_frequency If TRUE the algorithm will try to estimate the frequency of the time-series automatically.

maxgap Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than 'maxgap' will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.

... Additional parameters for these algorithms that can be passed through. Look at na_interpolation, na_locf, na_random, na_mean for parameter options.

Value

Vector (vector) or Time Series (ts) object (dependent on given input at parameter x)

Author(s)

Steffen Moritz

# Example 2: Perform seasonal imputation using algorithm = "mean"
na_seadec(tsAirgap, algorithm = "mean")

# Example 3: Same as example 1, just written with pipe operator
tsAirgap %>% na_seadec(algorithm = "interpolation")
**na_seasplit**

*Seasonally Splitted Missing Value Imputation*

**Description**
Splits the times series into seasons and afterwards performs imputation separately for each of the resulting time series datasets (each containing the data for one specific season).

**Usage**
```r
na_seasplit(
  x,
  algorithm = "interpolation",
  find_frequency = FALSE,
  maxgap = Inf,
  ...
)
```

**Arguments**
- **x**
  Numeric Vector (`vector`) or Time Series (`ts`) object in which missing values shall be replaced
- **algorithm**
  Algorithm to be used after splits. Accepts the following input:
  - "interpolation" - Imputation by Interpolation (default choice)
  - "locf" - Imputation by Last Observation Carried Forward
  - "mean" - Imputation by Mean Value
  - "random" - Imputation by Random Sample
  - "kalman" - Imputation by Kalman Smoothing and State Space Models
  - "ma" - Imputation by Weighted Moving Average
- **find_frequency**
  If TRUE the algorithm will try to estimate the frequency of the time-series automatically.
- **maxgap**
  Maximum number of successive NAs to still perform imputation on. Default setting is to replace all NAs without restrictions. With this option set, consecutive NAs runs, that are longer than `maxgap` will be left NA. This option mostly makes sense if you want to treat long runs of NA afterwards separately.
- **...**
  Additional parameters for these algorithms that can be passed through. Look at `na_interpolation`, `na_locf`, `na_random`, `na_mean` for parameter options.

**Value**
Vector (`vector`) or Time Series (`ts`) object (dependent on given input at parameter `x`)

**Author(s)**
Steffen Moritz

# Example 2: Perform seasonal splitted imputation using algorithm = "mean"
na_seasplit(tsAirgap, algorithm = "mean")

# Example 3: Same as example 1, just written with pipe operator
tsAirgap %>% na_seasplit(algorithm = "interpolation")

statsNA

Print Statistics about Missing Values

Description

Print summary stats about the distribution of missing values in a univariate time series.

Usage

statsNA(x, bins = 4, print_only = TRUE)

Arguments

x    Numeric Vector (vector) or Time Series (ts) object containing NAs
bins Split number for bin stats. Number of bins the time series gets divided into.
      For each bin information about amount/percentage of missing values is printed. Default value is 4 - what means stats about the 1st,2nd,3rd,4th quarter of the time series are shown.
print_only Choose if the function Prints or Returns. For print_only = TRUE the function has no return value and just prints out missing value stats. If print_only is changed to FALSE, nothing is printed and the function returns a list.Print gives a little bit more information, since the returned list does not include "Stats for Bins" and "overview NA series"

Details

Prints the following information about the missing values in the time series:

- "Length of time series" - Number of observations in the time series (including NAs)
- "Number of Missing Values" - Number of missing values in the time series
- "Percentage of Missing Values" - Percentage of missing values in the time series
• "Number of Gaps" - Number of NA gaps (consisting of one or more consecutive NAs) in the time series
• "Average Gap Size" - Average size of consecutive NAs for the NA gaps in the time series
• "Stats for Bins" - Number/percentage of missing values for the split into bins
• "Longest NA gap" - Longest series of consecutive missing values (NAs in a row) in the time series
• "Most frequent gap size" - Most frequent occurring series of missing values in the time series
• "Gap size accounting for most NAs" - The series of consecutive missing values that accounts for most missing values overall in the time series
• "Overview NA series" - Overview about how often each series of consecutive missing values occurs. Series occurring 0 times are skipped

It is furthermore, important to note, that you are able to choose whether the function returns a list or prints the information only. (see description of parameter "print_only")

Value

A list containing the stats. Beware: Function gives only a return value if print_only = FALSE.

tsAirgap

**Time series of monthly airline passengers (with NAs)**

Description

Monthly totals of international airline passengers, 1949 to 1960. This time series contains missing values. In the package included is also the tsAirgapComplete time series providing the true values for the missing values.
Usage

tsAirgap

Format

Time Series (ts) with 144 rows including 13 NAs.

Details

The dataset originates from Box & Jenkins (see citation) and is a commonly used example in time series analysis literature.

It characteristics (strong trend, strong seasonal behavior) make it also a great example for time series imputation. Thus the version with inserted NA gaps was created under the name tsAirgap.

In order to use this series for comparing imputation algorithm results, there are two time series provided. One series without missing values, which can be used as ground truth. Another series with NAs, on which the imputation algorithms can be applied.

There are the two time series:

- tsAirgap - The time series with NAs.
- tsAirgapComplete - Time series without NAs.

<table>
<thead>
<tr>
<th>tsHeating</th>
<th>Time series of a heating systems supply temperature (with NAs)</th>
</tr>
</thead>
</table>

Description

Time series of a heating systems supply temperature. Measured from 18.11.2013 - 05:12:00 to 13.01.2015 - 15:08:00 in 1 minute steps. This time series contains missing values. In the package included is also the tsHeatingComplete time series providing the true values for the missing values.

Usage

tsHeating

Format

Time Series (ts) with 606837 rows including 57391 NAs.
Details

The time series originates from the GECCO Industrial Challenge 2015. This Challenge was about "Recovering missing information in heating system operating data". Goal was to impute missing values in heating system sensor data as accurate as possible. (doi: 10.5281/zenodo.3884899)

In order to use this series for comparing imputation algorithm results, there are two time series provided. One series without missing values, which can be used as ground truth. Another series with NAs, on which the imputation algorithms can be applied. The NAs thereby were inserted according to patterns found in similar time series.
