Package ‘isoband’

July 13, 2021

Title Generate Isolines and Isobands from Regularly Spaced Elevation Grids

Version 0.2.5

Description A fast C++ implementation to generate contour lines (isolines) and contour polygons (isobands) from regularly spaced grids containing elevation data.

angle_halfcircle_bottom

Standardize label angles

Description

Function factories that return functions to standardize rotation angles to specific angle ranges.

Usage

angle_halfcircle_bottom()
angle_halfcircle_right()
angle_fixed(theta = 0)
angle_identity()

Arguments

theta Fixed angle, in radians.

Details

angle_halfcircle_bottom() standardizes angles to (-pi/2, pi/2].
angle_halfcircle_right() standardizes angles to (0, pi].
angle_fixed() sets all angles to a fixed value (0 by default).
angle_identity() does not modify any angles.

clip_lines

Clip lines so they don’t run into a set of boxes.

Description

Clip lines so they don’t run into a set of boxes. Useful for labeling isolines, as it allows removal of
line segments that would run into any text labels.

Usage

clip_lines(x, y, id, clip_boxes, asp = 1)
Arguments

x Numeric vector of x coordinates
y Numeric vector of y coordinates
id Integer vector of id numbers indicating which lines are connected
clip_boxes Data frame specifying the locations of boxes to clip to. Should have five columns, named x, y, width, height, theta, which specify the x and y positions of each box midpoint, as well as the box width, box height, and box angle in radians. Each box is specified by one data row.
asp Aspect ratio (width/height) of the target canvas. This is used to convert widths to heights and vice versa for rotated boxes

---

isobands Efficient calculation of isolines and isobands from elevation grid

Description

Efficient calculation of isolines and isobands from elevation grid

Usage

isobands(x, y, z, levels_low, levels_high)
isolines(x, y, z, levels)

Arguments

x Numeric vector specifying the x locations of the grid points.
y Numeric vector specifying the y locations of the grid points.
z Numeric matrix specifying the elevation values for each grid point.
levels_low, levels_high Numeric vectors of minimum/maximum z values for which isobands should be generated. Any z values that are exactly equal to a value in levels_low are considered part of the corresponding isoband, but any z values that are exactly equal to a value in levels_high are not considered part of the corresponding isoband. In other words, the intervals specifying isobands are closed at their lower boundary and open at their upper boundary.
levels Numeric vector of z values for which isolines should be generated.

  0, 1, 2, 2, 1, 0,
  0, 1, 2, 2, 1, 0,
  0, 1, 1, 1, 0,
  0, 0, 0, 0, 0), 6, 6, byrow = TRUE)
plot_iso(m, 0.5, 1.5)
Description

This function generates a grid grob that represents isobands.

Usage

```r
isobands_grob(bands, gp = gpar(), units = "npc")
```

Arguments

- `bands`: Isobands, as produced by the `isobands()` function.
- `gp`: Grid graphical parameters. Parameters are recycled among the total number of bands drawn.
- `units`: A character string specifying the units in which to interpret the isobands coordinates. Defaults to "npc".

See Also

See `isolines_grob()` for drawing of isolines.

Examples

```r
library(grid)

viridis_pal <- colorRampPalette(
  c("#440154", "#414487", "#2A788E", "#22A884", "#7AD151", "#FDE725"),
  space = "Lab"
)

x <- (1:ncol(volcano))/(ncol(volcano)+1)
y <- (nrow(volcano):1)/(nrow(volcano)+1)
bands <- isobands(x, y, volcano, 5*(18:38), 5*(19:39))

b <- isobands_grob(
bands,
gp = gpar(col = "black", fill = viridis_pal(21), alpha = 0.5)
)

grid.newpage()
grid.draw(b)
```

isolines_grob

Render labeled isolines

Description

This function generates a grid grob that represents labeled isolines.
Usage

isolines_grob(
  lines,
  gp = gpar(),
  breaks = NULL,
  labels = NULL,
  margin = unit(c(1, 1, 1, 1), "pt"),
  label_col = NULL,
  label_alpha = NULL,
  label_placer = label_placer_minmax(),
  units = "npc"
)

Arguments

- **lines**: Isolines, as produced by the `isolines()` function.
- **gp**: Grid graphical parameters. Parameters applying to lines (such as col, lwd, lty, etc.) are recycled among the total number of lines drawn. Parameters applying only to labels (such as fontfamily, fontsize) are recycled among the specified breaks only. The two parameters col and alpha are also applied to labels, unless overridden (see label_col and label_alpha), but are matched to the corresponding lines.
- **breaks**: Character vector specifying the isolines that should be labeled. If NULL, labels all isolines.
- **labels**: Character vector specifying the labels for each break. If NULL, uses the breaks as labels. The number of labels provided must match the number of breaks provided.
- **margin**: Unit object of length 4 specifying the top, right, bottom, and left margins around each text label. The same margins are applied to all labels.
- **label_col**: Color applied to labels. Can be used to override the color provided in gp, in case labels and lines should have different colors.
- **label_alpha**: Alpha applied to labels. Can be used to override the alpha value provided in gp, in case labels and lines should have different alpha values.
- **label_placer**: Function that controls how labels are placed along the isolines. Uses `label_placer_minmax()` by default.
- **units**: A character string specifying the units in which to interpret the isolines coordinates. Defaults to "npc".

See Also

See `isobands_grob()` for drawing of isobands. See `label_placer_minmax()` for label placement strategies.

Examples

```
library(grid)
```
viridis_pal <- colorRampPalette(c("#440154", "#414487", "#2A788E", "#22A884", "#7AD151", "#FDE725"), space = "Lab")

x <- (1:ncol(volcano))/(ncol(volcano)+1)
y <- (nrow(volcano):1)/(nrow(volcano)+1)
lines <- isolines(x, y, volcano, 5*(19:38))
bands <- isobands(x, y, volcano, 5*(18:38), 5*(19:39))

b <- isobands_grob(bands,
      gp = gpar(col = NA, fill = viridis_pal(21), alpha = 0.4)
)
l <- isolines_grob(lines, breaks = 20*(5:10),
      gp = gpar(lwd = c(.3, 1, .3, .3))
)

grid.newpage()
grid.draw(b)
grid.draw(l)

iso_to_sfg

Convert isolines or isobands to sfg object

Description
Convert isolines or isobands to an sf geometry collection (sfg) object. Further downstream processing needs to happen via the sf package.

Usage
iso_to_sfg(x)

Arguments
x

The object to convert.

Details
The function iso_to_sfg() is a generic that takes an object created by either isolines() or isobands() and turns it into a simple features (sf) geometry collection. Importantly, the isobanding algorithm can produce polygons that do not represent valid simple features. This happens usually when the lower limit of an isoband is exactly equal to some data values (see examples for a demonstration). This can be worked around either by slightly shifting the data or band limits (e.g., round all data values and then shift them by a value smaller than the rounding error) or by fixing the geometries using the function st_make_valid().
Examples

if (requireNamespace("sf", quietly = TRUE)) {
  library(sf)
  library(ggplot2)

  # Example 1: simple 5x5 matrix
  m <- matrix(c(0, 2, 2, 2, 0,
               0, 1, 0, 1, 0,
               0, 1, 0, 0, 0,
               0, 1, 0, 1, 0,
               0, 0, 0, 0, 0), 5, 5, byrow = TRUE)

  z <- isolines(1:ncol(m), nrow(m):1, m, c(0.5, 1.5))
  lines <- iso_to_sfg(z)
  x <- st_sf(level = names(lines), geometry = st_sfc(lines))
  ggplot(x) + geom_sf(aes(color = level))

  # Example 2: volcano dataset
  m <- volcano
  b <- isobands((1:ncol(m))/(ncol(m)+1), (nrow(m):1)/(nrow(m)+1), m,
                 10*9:19, 10*10:20)
  bands <- iso_to_sfg(b)
  x <- st_sf(level = as.numeric(sub(".*", "", names(bands))), geometry = st_sfc(bands))
  ggplot(x) + geom_sf(aes(color = level, fill = level))

  # Example 3: invalid simple features
  m <- matrix(c(1.5, 1.5, 1.5, 1.5, 0.6,
                0.5, 1.5, 1.5, 0, 0,
                0, 1, 0, 1, 1,
                0, 1, 0, 0.7, 0,
                0.9, 1.3, 1.8, 1.4, 0.4), 5, 5, byrow = TRUE)

  raw <- isobands(1:5, 5:1, m, levels_low = 0:1, levels_high = 1:2)
  bands <- iso_to_sfg(raw)

  iso <- st_sf(
    id = factor(1:length(bands)),
    geometry = st_sfc(bands)
  )

  # the geometries are not valid
  st_is_valid(iso, reason = TRUE)
  # this doesn't prevent us from plotting them
  ggplot(iso, aes(fill = id)) + geom_sf()

  # make all geometries valid, requires GEOS >= 3.8.0
  if (sf_extSoftVersion()[$"GEOS"] >= "3.8.0") {
    iso2 <- st_make_valid(iso)
    st_is_valid(iso2, reason=TRUE)
    # the plot should be unchanged
    ggplot(iso2, aes(fill = id)) + geom_sf()
  }
}
# alternatively, if we shift all data values by a tiny
# amount (here, 1e-10) so they don’t coincide with the band
# limits, no invalid geometries are generated.
raw <- isobands(1:5, 5:1, m + 1e-10, levels_low = 0:1, levels_high = 1:2)
bands <- iso_to_sfg(raw)
iso <- st_sf(id = factor(1:length(bands)), geometry = st_sfc(bands))
st_is_valid(iso, reason = TRUE)

label_placer_minmax

Set up a label placement strategy

Description

These functions set up various label placement strategies.

Usage

label_placer_minmax(
  placement = "tb",
  rot_adjuster = angle_halfcircle_bottom(),
  n = 2
)

label_placer_none()

label_placer_manual(breaks, x, y, theta)

label_placer_middle(rot_adjuster = angle_halfcircle_bottom())

Arguments

placement String consisting of any combination of the letters "t", "r", "b", "l" indicating the placement of labels at the top, to the right, at the bottom, to the left of the isoline.

rot_adjuster Function that standardizes the rotation angles of the labels. See e.g. angle_halfcircle_bottom().

n Size of the point neighborhood over which the rotation angle should be calculated.

breaks Character vector specifying the isolines to be labeled, as in isolines_grob().

x, y, theta Numeric vectors specifying the x and y positions and angles (in radians) for each label corresponding to each break.
**plot_iso**

**Details**

`label_placer_minmax()` places labels at the horizontal or vertical minima or maxima of the respective isolines.

`label_placer_none()` places no labels at all.

`label_placer_manual()` places labels at manually defined locations.

`label_placer_middle()` places labels at the middle of each isoline.

---

**Description**

This function visualizes a single isoband calculated from a matrix. It is mainly useful for debugging and visualizing the isobanding algorithm. See `isobands()` for more examples.

**Usage**

```r
plot_iso(
  m,         # input matrix
  vlo,       # lower cutoff for isobanding
  vhi,       # higher cutoff for isobanding
  fill_lo = "gray95", # fill color for points below the lower cutoff
  fill_mid = "gray50", # fill color for points between the two cutoffs
  fill_hi = "black", # fill color for points above the higher cutoff
  fill_band = "cornsilk", # fill color for the isoband
  col_lo = "black", # line color for lower cutoff
  col_hi = "black", # line color for higher cutoff
  newpage = TRUE)  # boolean, indicating whether grid.newpage() should be called or not
```

**Arguments**

- `m`: input matrix
- `vlo`: lower cutoff for isobanding
- `vhi`: higher cutoff for isobanding
- `fill_lo`: fill color for points below the lower cutoff
- `fill_mid`: fill color for points between the two cutoffs
- `fill_hi`: fill color for points above the higher cutoff
- `fill_band`: fill color for the isoband
- `col_lo`: line color for lower cutoff
- `col_hi`: line color for higher cutoff
- `newpage`: boolean, indicating whether `grid.newpage()` should be called or not
Examples

\[
\begin{align*}
m & \leftarrow \text{matrix(c(0, 0, 0, 0, 0, 0,}
& \quad 0, 2, 2, 2, 2, 0,}
& \quad 0, 2, 0, 0, 2, 0,}
& \quad 0, 2, 0, 0, 2, 0,}
& \quad 0, 2, 2, 2, 2, 0,}
& \quad 0, 0, 0, 0, 0, 0), 6, 6, \text{ byrow = TRUE)}
\end{align*}
\]
