Package ‘kableExtra’

January 24, 2024

Type Package
Title Construct Complex Table with ‘kable’ and Pipe Syntax
Version 1.4.0
Description Build complex HTML or ‘LaTeX’ tables using ‘kable()’ from ‘knitr’ and the piping syntax from ‘magrittr’. Function ‘kable()’ is a light weight table generator coming from ‘knitr’. This package simplifies the way to manipulate the HTML or ‘LaTeX’ codes generated by ‘kable()’ and allows users to construct complex tables and customize styles using a readable syntax.
License MIT + file LICENSE
BugReports https://github.com/haozhu233/kableExtra/issues
Depends R (>= 3.1.0)
Imports knitr (>= 1.33), magrittr, stringr (>= 1.0), xml2 (>= 1.1.1), markdown (>= 1.6.0), scales, viridisLite, stats, grDevices, htmltools, rstudioapi, tools, digest, graphics, svglite
Suggests testthat, magick, tinytex, formattable, sparkline, webshot2
Config/testthat/edition 3
VignetteBuilder knitr
Encoding UTF-8
RoxygenNote 7.2.3
Language en-US
NeedsCompilation no

When we are talking about table generators in R, knitr's `kable()` function wins lots of flavor by its ultimate simplicity. Unlike those powerful table rendering engines such as `xtable`, the philosophy behind `knitr::kable()` is to make it easy for programmers to use. Just as it claimed in its function description, "this is a very simple table generator. It is simple by design. It is not intended to replace any other R packages for making tables. - Yihui".

However, the ultimate simplicity of `kable()` also brought troubles to some of us, especially for new R users, who may not have a lot of experience on generating tables in R. It is not rare to see people including experienced users asking questions like how to center/left-align a table on Stack Overflow. Also, for me personally, I found myself repeatedly parsing CSS into `kable()` for some very simple features like striped lines. For LaTeX, it’s even worse since I’m almost Stack Overflow dependent for LaTeX... That’s why this package `kableExtra` was created.

I hope with `kableExtra`, you can

- Use default base `kable()` (Or a good alternative for markdown tables is `pander::pander()`) for all simple tables
- Use `kable()` with `kableExtra` to generate 90% of complex/advanced tables in either HTML or LaTeX
- Only have to mess with raw HTML/LaTeX in the last 10% cases where `kableExtra` cannot solve the problem

For a full package documentation, please visit the package documentation site for more information.
Features

**Pipable syntax:** `kableExtra` is NOT a table generating package. It is a package that can "add features" to a `kable` output using a syntax that every user loves - the pipe. We see similar approaches to deal with plots in packages like `ggvis` and `plotly`. There is no reason why we cannot use it with tables.

**Unified functions for both HTML and PDF:** Most functionalities in `kableExtra` can work in both HTML and PDF. In fact, as long as you specifies format in `kable` (which can be set globally through option `knitr.table.format`), functions in this package will pick the right way to manipulate the table by themselves. As a result, if users want to left align the table, `kable_styling(kable(...), position = "left")` will work in both HTML and PDF.

Note

If you found a feature on the documentation site that is not available in the version of `kableExtra` you are using, try to install the pre-release version from Github. You can do so by running `devtools::install_github("haozhu233/kableExtra")`. Also, note that This package can load required LaTeX package automatically in vanilla R Markdown. For customized R Markdown templates, it is recommended to load related LaTeX packages manually.

### add_footnote

**Add footnote**

**Description**

Add footnote to your favorite `kable` output.

**Usage**

```r
add_footnote(
  input,
  label = NULL,
  notation = getOption("kable_footnote_notation", "alphabet"),
  threeparttable = FALSE,
  escape = TRUE
)
```

**Arguments**

- **input**: The direct output of your `kable` function or your last `kableExtra` function.
- **label**: A vector of footnotes you want to add. You don’t need to add notations in your notes.
- **notation**: You can select the format of your footnote notation from number, alphabet, symbol and none.
- **threeparttable**: Boolean value indicating if a threeparttable scheme should be used.
- **escape**: Logical value controlling if the label needs to be escaped. Default is TRUE.
add_header_above

See Also

footnote(), footnote_marker_number()

Examples

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
add_footnote(x, c("footnote 1", "footnote 2"), notation = "symbol")
## End(Not run)
```

---

### Description

Tables with multiple rows of header rows are extremely useful to demonstrate grouped data. This function takes the output of a `kable()` function and adds an header row on top of it.

### Usage

```r
add_header_above(
  kable_input,
  header = NULL,
  bold = FALSE,
  italic = FALSE,
  monospace = FALSE,
  underline = FALSE,
  strikeout = FALSE,
  align = "c",
  color = NULL,
  background = NULL,
  font_size = NULL,
  angle = NULL,
  escape = TRUE,
  line = TRUE,
  line_sep = 3,
  extra_css = NULL,
  include_empty = FALSE,
  border_left = FALSE,
  border_right = FALSE
)
```
Arguments

kable_input  Output of `knitr::kable()` with format specified.
header  A (named) character vector with colspan as values. For example, `c(" ", "title" = 2)` can be used to create a new header row for a 3-column table with "title" spanning across column 2 and 3. For convenience, when colspan equals to 1, users can drop the `=` part. As a result, `c(" ", "title" = 2)` is the same as `c(" ", "title" = 2)`. Alternatively, a data frame with two columns can be provided: The first column should contain the header names (character vector) and the second column should contain the colspan (numeric vector). This input can be used if there are problems with Unicode characters in the headers.

bold  A T/F value to control whether the text should be bolded.
italic  A T/F value to control whether the text should be emphasized.
monospace  A T/F value to control whether the text of the selected column need to be monospaced (verbatim).
underline  A T/F value to control whether the text of the selected row need to be underlined.
strikeout  A T/F value to control whether the text of the selected row need to be struck out.
align  A character string for cell alignment. For HTML, possible values could be l, c, r plus left, center, right, justify, initial and inherit while for LaTeX, you can only choose from l, c & r.
color  A character string/vector for text color. Here please pay attention to the differences in color codes between HTML and LaTeX.
background  A character string/vector for background color. Here please pay attention to the differences in color codes between HTML and LaTeX. Also note that in HTML, background defined in cell_spec won’t cover the whole cell.
font_size  A numeric input/vector for font size. For HTML, you can also use options including xx-small, x-small, small, medium, large, x-large, xx-large, smaller, larger, initial and inherit.
angle  0-360, degree that the text will rotate.
escape  A T/F value showing whether special characters should be escaped.
line  A T/F value to control whether a line will appear underneath the header.
line_sep  A numeric value indicating how much the midlines should be separated by space. Default is 3.
extra_css  An HTML only option. CSS defined here will be send to the td cell.
include_empty  Whether empty cells in HTML should also be styled. Default is FALSE.
border_left  T/F option for border on the left side in LaTeX.
border_right  T/F option for border on the right side in LaTeX.

Examples

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
# Add a row of header with 3 columns on the top of the table. The column
# span for the 2nd and 3rd one are 5 & 6.
```
add_indent

add_header_above(x, c(" ", "Group 1" = 5, "Group 2" = 6))

## End(Not run)

---

**add_indent**  
  
  *Add indentations to row headers*

**Description**

Add indentations to row headers

**Usage**

```r
add_indent(
  kable_input,
  positions,
  level_of_indent = 1,
  all_cols = FALSE,
  target_cols = 1
)
```

**Arguments**

- `kable_input`  
  Output of `knitr::kable()` with format specified
- `positions`  
  A vector of numeric row numbers for the rows that need to be indented.
- `level_of_indent`  
  A numeric value for the indent level. Default is 1.
- `all_cols`  
  T/F whether to apply indentation to all columns
- `target_cols`  
  A vector of numeric column positions. Default is 1.

**Examples**

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
# Add indentations to the 2nd & 4th row
add_indent(x, c(2, 4), level_of_indent = 1)

## End(Not run)
```
as_image

Render the table as an format-independent image and use it in R Mark-
down

Description

This function generates a temporary png file using save_kable and then try to put it in an R Mark-
down document using knitr::include_graphics.

Usage

as_image(x, width = NULL, height = NULL, file = NULL, ...)

Arguments

x
kable input. Either HTML or LaTeX

width
Image width in inches. (1 inch = 2.54 cm)

height
Image height in inches. (1 inch = 2.54 cm)

file
By default, as_image saves to an temp file, which works for normal R Mark-
down. However if you are using things like xaringan, which can't be a stan-
dalone html, you can specify this file be the path you need, e.g. "img/something.png"

... Additional arguments passed to save_kable.

Examples

## Not run:
library(kableExtra)
kable(mtcars, "latex", booktabs = T) \%\%
kable_styling(latex_options = c("striped", "scale_down")) \%\%
row_spec(1, color = "red") \%\%
as_image()

## End(Not run)

auto_index

Automatically figuring out the group_row index

Description

This helper function allows users to build the group_row index more quickly and use group_rows
in a way that is similar with collapse_rows.

Usage

auto_index(x)
Arguments

x The index column. A vector. For example `c("a", "a", "b", "b", "b")`

Description

Specify Cell format before it gets into kable

Usage

cell_spec(
  x,
  format,
  bold = FALSE,
  italic = FALSE,
  monospace = FALSE,
  underline = FALSE,
  strikeout = FALSE,
  color = NULL,
  background = NULL,
  align = NULL,
  font_size = NULL,
  angle = NULL,
  tooltip = NULL,
  popover = NULL,
  link = NULL,
  new_tab = FALSE,
  extra_css = NULL,
  escape = TRUE,
  background_as_tile = TRUE,
  latex_background_in_cell = TRUE
)

text_spec(
  x,
  format,
  bold = FALSE,
  italic = FALSE,
  monospace = FALSE,
  underline = FALSE,
  strikeout = FALSE,
  color = NULL,
  background = NULL,
  align = NULL,
Arguments

**x**
Things to be formatted. It could be a vector of numbers or strings.

**format**
Either "html" or "latex". It can also be set through `option(knitr.table.format)`, same as `knitr::kable()`.

**bold**
T/F for font bold.

**italic**
T/F for font italic.

**monospace**
T/F for font monospaced (verbatim)

**underline**
A T/F value to control whether the text of the selected row need to be underlined

**strikeout**
A T/F value to control whether the text of the selected row need to be struck out.

**color**
A character string for text color. Here please pay attention to the differences in color codes between HTML and LaTeX.

**background**
A character string for background color. Here please pay attention to the differences in color codes between HTML and LaTeX. Also note that in HTML, background defined in `cell_spec` won’t cover the whole cell.

**align**
A character string for cell alignment. For HTML, possible values could be `l`, `c`, `r` plus `left`, `center`, `right`, `justify`, `initial` and `inherit` while for LaTeX, you can only choose from `l`, `c` & `r`.

**font_size**
A numeric input for font size. For HTML, you can also use options including `xx-small`, `x-small`, `small`, `medium`, `large`, `x-large`, `xx-large`, `smaller`, `larger`, `initial` and `inherit`.

**angle**
0-360, degree that the text will rotate. Can be a vector.

**tooltip**
A vector of strings to be displayed as tooltip. Obviously, this feature is only available in HTML. Read the package vignette to see how to use bootstrap tooltip css to improve the loading speed and look.

**popover**
Similar with tooltip but can hold more contents. The best way to build a popover is through `spec_popover()`. If you only provide a text string, it will be used as content. Note that You have to enable this bootstrap module manually. Read the package vignette to see how.

**link**
A vector of strings for url links. Can be used together with tooltip and popover.

**new_tab**
T/F for whether to open up the new link in new tab.

**extra_css**
Extra css text to be passed into the cell
collapse_rows

### Description

Collapse same values in columns into multirow cells. This feature does similar things with `group_rows`. However, unlike `group_rows`, it analyzes existing columns, finds out rows that can be grouped together, and make them multirow cells. Note that if you want to use `column_spec` to specify column styles, you should use `column_spec` before `collapse_rows`.

### Usage

```r
collapse_rows(
  kable_input,
  columns = NULL,
  valign = c("middle", "top", "bottom"),
  latex_hline = c("full", "major", "none", "custom", "linespace"),
  row_group_label_position = c("identity", "stack", "first"),
  custom_latex_hline = NULL,
  row_group_label_fonts = NULL,
  headers_to_remove = NULL,
  target = NULL,
  col_names = TRUE,
  longtable_clean_cut = TRUE
)
```

### Arguments

- **kable_input**: Output of `knitr::kable()` with format specified
- **columns**: A numeric value or vector indicating in which column(s) rows need to be collapsed.
- **valign**: Select from "top", "middle" (default), "bottom". The reason why "top" is not default is that the multirow package on CRAN win-builder is not up to date. Only used when `row_group_label_position` is identity.
- **latex_hline**: Option controlling the behavior of adding hlines to table. Choose from full, major, none, custom and linespace.
row_group_label_position
Option controlling positions of row group labels. Choose from identity, stack, or first – the latter behaves like identity when `row_group_label_position` is top but without using the multirow package.

custom_latex_hline
Numeric column positions whose collapsed rows will be separated by hlines.

row_group_label_fonts
A list of arguments that can be supplied to `group_rows` function to format the row group label when `row_group_label_position` is stack.

headers_to_remove
Numeric column positions where headers should be removed when they are stacked.

target
If multiple columns are selected to do collapsing and a target column is specified, this target column will be used to collapse other columns based on the groups of this target column.

col_names
T/F. A LaTeX specific option. If you set `col.names` be `NULL` in your `kable` call, you need to set this option false to let everything work properly.

longtable_clean_cut
T/F with default T. Multirow cell sometimes are displayed incorrectly around pagebreak. This option forces groups to cut before the end of a page. If you have a group that is longer than 1 page, you need to turn off this option.

Examples
```r
## Not run:
dt <- data.frame(a = c(1, 1, 2, 2), b = c("a", "a", "a", "b"))
x <- knitr::kable(dt, "html")
collapse_rows(x)
## End(Not run)
```

column_spec
Specify the look of the selected column

Description
This function allows users to select a column and then specify its look.

Usage
```
column_spec(
kable_input, column, width = NULL, bold = FALSE,
```
italic = FALSE,
monospace = FALSE,
underline = FALSE,
strikeout = FALSE,
color = NULL,
background = NULL,
border_left = FALSE,
border_right = FALSE,
width_min = NULL,
width_max = NULL,
extra_css = NULL,
include_thead = FALSE,
latex_column_spec = NULL,
latex_valign = "p",
link = NULL,
new_tab = TRUE,
tooltip = NULL,
popover = NULL,
image = NULL
)

Arguments

kable_input Output of knitr::kable() with format specified
column A numeric value or vector indicating which column(s) to be selected.
width A character string telling HTML & LaTeX how wide the column needs to be, e.g. "10cm", "3in" or "30em".
bold T/F value or vector to control whether the text of the selected column need to be bolded.
italic T/F value or vector to control whether the text of the selected column need to be emphasized.
monospace T/F value or vector to control whether the text of the selected column need to be monospaced (verbatim)
underline T/F value or vector to control whether the text of the selected row need to be underlined
strikeout T/F value or vector to control whether the text of the selected row need to be struck out.
color A character string or vector for column text color. Here please pay attention to the differences in color codes between HTML and LaTeX.
background A character string or vector for column background color. Here please pay attention to the differences in color codes between HTML and LaTeX.
border_left A logical variable indicating whether there should be a border line on the left of the selected column. In HTML, you can also pass in a character string for the CSS of the border line
border_right  A logical variable indicating whether there should be a border line on the right of the selected column. In HTML, you can also pass in a character string for the CSS of the border line.

width_min     Only for HTML table. Normal column width will automatically collapse when the window cannot hold enough contents. With this width_min, you can set up a column with a width that won’t collapse even when the window is not wide enough.

width_max     Only for HTML table. width_max defines the maximum width of table columns.

extra_css     A vector of extra css text to be passed into the cells of the column.

include_thead T/F. A HTML only feature to control whether the header row will be manipulated. Default is FALSE.

latex_column_spec Only for LaTeX tables. Code to replace the column specification. If not NULL, will override all other arguments.

latex_valign   vertical alignment. Only works when you specified column width. Choose among p, m, b.

link          A vector of strings for url links.

new_tab       T/F for whether to open up the new link in new tab

tooltip       A vector of strings to be displayed as tooltip. Obviously, this feature is only available in HTML. Read the package vignette to see how to use bootstrap tooltip css to improve the loading speed and look.

popover      Similar with tooltip but can hold more contents. The best way to build a popover is through spec_popover(). If you only provide a text string, it will be used as content. Note that You have to enable this bootstrap module manually. Read the package vignette to see how.

image         Vector of image paths.

Details

Use latex_column_spec in a LaTeX table to change or customize the column specification. Because of the way it is handled internally, any backslashes must be escaped.

Examples

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
column_spec(x, 1:2, width = "20em", bold = TRUE, italic = TRUE)
x <- knitr::kable(head(mtcars), "latex", booktabs = TRUE)
column_spec(x, 1, latex_column_spec = ">{\\color{red}}c")
## End(Not run)
```
Description

footnote provides a more flexible way to add footnote. You can add multiple sets of footnote using different notation systems. It is also possible to specify footnote section header one by one and print footnotes as a chunk of texts.

Usage

```r
footnote(
  kable_input,
  general = NULL,
  number = NULL,
  alphabet = NULL,
  symbol = NULL,
  footnote_order = c("general", "number", "alphabet", "symbol"),
  footnote_as_chunk = FALSE,
  escape = TRUE,
  threeparttable = FALSE,
  fixed_small_size = FALSE,
  general_title = "Note: ",
  number_title = "",
  alphabet_title = "",
  symbol_title = "",
  title_format = "italic",
  symbol_manual = NULL
)
```

Arguments

- `kable_input`: HTML or LaTeX table generated by `knitr::kable`
- `general`: Text for general footnote comments. Footnotes in this section won’t be labeled with any notations
- `number`: A vector of footnote texts. Footnotes here will be numbered. There is no upper cap for the number of footnotes here
- `alphabet`: A vector of footnote texts. Footnotes here will be labeled with "a,b,c". The vector here should not have more than 26 elements.
- `symbol`: A vector of footnote texts. Footnotes here will be labeled with special symbols. The vector here should not have more than 20 elements.
- `footnote_order`: The order of how to arrange general, number, alphabet and symbol.
- `footnote_as_chunk`: T/F value. Default is FALSE. It controls whether the footnotes should be printed in a chunk (without line break).
footnote_marker_number

**escape**
T/F value. It controls whether the contents and titles should be escaped against HTML or LaTeX. Default is TRUE.

**threeparttable**
T/F value for whether to use LaTeX package threeparttable. Threeparttable will force the width of caption and footnotes be the width of the original table. It's useful when you have long paragraph of footnotes.

**fixed_small_size**
T/F When you want to keep the footnote small after specifying large font size with the kable_styling() (e.g. ideal font for headers and table content with small font in footnotes).

**general_title**
Section header for general footnotes. Default is "Note: ".

**number_title**
Section header for number footnotes. Default is "".

**alphabet_title**
Section header for alphabet footnotes. Default is "".

**symbol_title**
Section header for symbol footnotes. Default is "".

**title_format**
Choose from "italic"(default), "bold" and "underline". Multiple options are possible.

**symbol_manual**
User can manually supply a vector of either html or latex symbols. For example, symbol_manual = c("\*", "\dag", "\ddag").

See Also

add_footnote(), footnote_marker_number()

Examples

```r
## Not run:
dt <- mtcars[1:5, 1:5]
colnames(dt)[1] <- paste0("mpg", 
    footnote_marker_alphabet(2))
rownames(dt)[2] <- paste0(rownames(dt)[2],
    footnote_marker_alphabet(1))
dt[1,2] <- paste0(dt[1,2], footnote_marker_alphabet(3))

kbl(dt, escape = FALSE) |> 
footnote(alphabet = c("Note a", "Note b", "Note c"))
```

## End(Not run)

footnote_marker_number

**Footnote marker**

**Description**

Put footnote mark in superscription in table. Unless you are using it in the caption of kable, you will need to put escape = F in kable (similar with cell_spec). Again, similar with cell_spec, the format option here can read default value from global option knitr.table.format.
Usage

footnote_marker_number(x, format, double_escape = FALSE)

footnote_marker_alphabet(x, format, double_escape = FALSE)

footnote_marker_symbol(x, format, double_escape = FALSE)

Arguments

x  a number. For example, for `footnote_marker_alphabet(2)` will return "b" in HTML.

format  Either html or latex. All functions here can read default value from global option `knitr.table.format`.

double_escape  T/F if output is in LaTeX, whether it should be double escaped. If you are using `footnote_marker` in `group_rows`` labeling row or `add_header_above`, you need to set this to be TRUE'.

Examples

## Not run:
dt <- mtcars[1:5, 1:5]
colnames(dt)[1] <- paste0("mpg",
    footnote_marker_alphabet(2))
rownames(dt)[2] <- paste0(rownames(dt)[2],
    footnote_marker_alphabet(1))
dt[1,2] <- paste0(dt[1,2], footnote_marker_alphabet(3))

kbl(dt, escape = FALSE) |>  
    footnote(alphabet = c("Note a", "Note b", "Note c"))

## End(Not run)
Arguments

- **filename**: Passed through to the graphics device.
- **width, height**: Plot dimensions in pixels.
- **res**: The resolution of the plot; default is 300.
- **...**: extra parameters passing to the graphics-device function.
- **dev**: Character (e.g., "svg", "pdf") or function (e.g., `grDevices::svg`, `grDevices::pdf`).

Details

- `graphics_dev` generalizes the use of `res` and plot dimensions across graphic devices. Raster-based devices (e.g., 'png', 'jpeg', 'tiff', 'bmp') tend to use `res` and the width/height units default to pixels. All other devices (e.g., 'pdf', 'svg') tend to use inches as the default units for width/height, and error when `res` is provided.

  The current heuristic is the look for the `res` argument in the function’s formals; if that is present, then it is assumed that the default units are in pixels, so `width`, `height`, and `res` are passed through unmodified. If `res` is not present, then `width` and `height` are converted from pixels to inches, and `res` is not passed to the function.

  Another purpose of this function is to generalize the different graphic functions’ use of `file=` versus `filename=`.

- `is_svg` determines if the plot device is svg-like, typically one of "svg", `grDevices::svg`, or `svglite::svglite`.

- `dev_chr` determines the filename extension for the applicable plot function; when `dev` is a string, then it is returned unchanged; when `dev` is a function, the formals of the function are checked for clues (i.e., default value of a `file=` argument).

Value

- `graphics_dev`: nothing, a plot device is opened
- `'is_svg'`: logical
- `dev_chr`: character

Functions

- `graphics_dev()`: Generalize res and filename across device functions
- `is_svg()`: Determine if plot device is svg-like
- `dev_chr()`: Determine filename extension
group_rows

Put a few rows of a table into one category

Description

Group a few rows in a table together under a label.

Usage

```r
group_rows(
    kable_input,
    group_label = NULL,
    start_row = NULL,
    end_row = NULL,
    index = NULL,
    label_row_css = "border-bottom: 1px solid;",
    latex_gap_space = "0.3em",
    escape = TRUE,
    latex_align = "l",
    latex_wrap_text = FALSE,
    colnum = NULL,
    bold = TRUE,
    italic = FALSE,
    hline_before = FALSE,
    hline_after = FALSE,
    extra_latex_after = NULL,
    indent = TRUE,
    monospace = FALSE,
    underline = FALSE,
    strikeout = FALSE,
    color = NULL,
    background = NULL
)
```

```r
pack_rows(
    kable_input,
    group_label = NULL,
    start_row = NULL,
    end_row = NULL,
    index = NULL,
    label_row_css = "border-bottom: 1px solid;",
    latex_gap_space = "0.3em",
    escape = TRUE,
    latex_align = "l",
    latex_wrap_text = FALSE,
    colnum = NULL,
    bold = TRUE,
```
italic = FALSE,
hline_before = FALSE,
hline_after = FALSE,
extra_latex_after = NULL,
indent = TRUE,
monospace = FALSE,
underline = FALSE,
strikeout = FALSE,
color = NULL,
background = NULL
)

Arguments

kable_input  Output of knitr::kable() with format specified

Arguments

group_label  A character string for the name of the group

Arguments

start_row  A numeric value that tells the function in which row the group starts. Note that the counting excludes header rows and other group labeling rows

Arguments

date_row  A numeric value that tells the function in which row the group ends.

Arguments

index  A named vector providing the index for robust row-grouping tasks. Basically, you can use it in the same way as add_header_above().

Arguments

label_row_css  A character string for any customized css used for the labeling row. By default, the labeling row will have a solid black line underneath. Only useful for HTML documents.

Arguments

latex_gap_space  A character value telling LaTeX how large the gap between the previous row and the group labeling row. Only useful for LaTeX documents.

Arguments

escape  A T/F value showing whether special characters should be escaped.

Arguments

latex_align  Adjust justification of group_label in latex only. Value should be "c" for centered on row, "r" for right justification, or "l" for left justification. Default Value is "l". If using html, the alignment can be set by using the label_row_css parameter.

Arguments

latex_wrap_text  T/F for wrapping long text. Default is off. Whenever it is turned on, the table will take up the entire line. It's recommended to use this with full_width in kable_styling.

Arguments

column  A numeric that determines how many columns the text should span. The default setting will have the text span the entire length.

Arguments

bold  A T/F value to control whether the text should be bolded.

Arguments

italic  A T/F value to control whether the text should be emphasized.

Arguments

hline_before  A T/F value that adds a horizontal line before the group_row label. Default value is False.

Arguments

hline_after  A replicate of hline_after in xtable. It adds a hline after the row

Arguments

eextra_latex_after  Extra LaTeX text to be added after the row.
header_separate

**indent**  
A T/F value to control whether list items are indented.

**monospace**  
T/F value to control whether the text of the selected column need to be monospaced (verbatim)

**underline**  
T/F value to control whether the text of the selected row need to be underlined

**strikeout**  
T/F value to control whether the text of the selected row need to be struck out.

**color**  
A character string for column text color. Here please pay attention to the differences in color codes between HTML and LaTeX.

**background**  
A character string for column background color. Here please pay attention to the differences in color codes between HTML and LaTeX.

---

**Examples**

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
# Put Row 2 to Row 5 into a Group and label it as "Group A"
pack_rows(x, "Group A", 2, 5)

## End(Not run)
```

---

**header_separate**  
Separate table headers and add additional header rows based on grouping

**Description**

When you create a summary table for either model or basic summary stats in R, you usually end up having column names in the form of "a_mean", "a_sd", "b_mean" and "b_sd". This function streamlines the process of renaming these column names and adding extra header rows using add_header_above.

**Usage**

```r
header_separate(kable_input, sep = "[[:alnum:]]+", ...)
```

**Arguments**

- **kable_input**
  Output of knitr::kable() with format specified

- **sep**
  A regular expression separator between groups. The default value is a regular expression that matches any sequence of non-alphanumeric values.

- **...**
  Additional parameters passed to do.call.
html_dependency_bsTable

*HTML dependency for Twitter bootstrap (table only)*

**Description**

HTML dependency for Twitter bootstrap (table only)

**Usage**

```javascript
html_dependency_bsTable()
```

---

html_dependency_kePrint

*HTML dependency for Javascript to enable bootstrap tooltip and popup message*

**Description**

HTML dependency for Javascript to enable bootstrap tooltip and popup message

**Usage**

```javascript
html_dependency_kePrint()
```

---

html_dependency_lightable

*HTML dependency for lightable*

**Description**

HTML dependency for lightable

**Usage**

```javascript
html_dependency_lightable()
```
### kableExtra_latex_packages

**LaTeX Packages**

#### Description

This function shows all LaTeX packages that is supposed to be loaded for this package in a R Markdown YAML format.

#### Usage

```r
kableExtra_latex_packages()
```

### kable_as_image

**Deprecated**

#### Description

deprecated

#### Usage

```r
kable_as_image(
    kable_input, 
    filename = NULL, 
    file_format = "png", 
    latex_header_includes = NULL, 
    keep_pdf = FALSE, 
    density = 300, 
    keep_tex = FALSE
)
```

#### Arguments

- **kable_input**: Raw LaTeX code to generate a table. It doesn’t have to came from `kable` or `kableExtra`
- **filename**: Character String. If specified, the image will be saved under the specified (path & name. You don’t need to put file format like ".png" here.
- **file_format**: Character String to specify image format, such as `png`, `jpeg`, `gif`, `tiff`, etc. Default is `png`.
- **latex_header_includes**: A character vector of extra LaTeX header stuff. Each element is a row. You can have things like `c("\\usepackage{threeparttable}", "\\usepackage{icons}")` You could probably add your language package here if you use non-English text in your table, such as `\\usepackage[magyar]{babel}.`
**kable_classic**

<table>
<thead>
<tr>
<th>keep_pdf</th>
<th>A T/F option to control if the mid-way standalone pdf should be kept. Default is FALSE.</th>
</tr>
</thead>
<tbody>
<tr>
<td>density</td>
<td>Resolution to read the PDF file. Default value is 300, which should be sufficient in most cases.</td>
</tr>
<tr>
<td>keep_tex</td>
<td>A T/F option to control if the latex file that is initially created should be kept. Default is FALSE.</td>
</tr>
</tbody>
</table>

---

**kable_as_xml**

*Read HTML kable as XML*

**Description**

This function will read kable as a xml file

**Usage**

```r
kable_as_xml(x)
```

**Arguments**

- **x**
  - kable or kableExtra object

---

**kable_classic**

*Alternative HTML themes*

**Description**

kableExtra uses the built-in bootstrap themes by default in kable_styling(). Alternatively, you can use a customized table themes for your table. This lightable table style sheet comes with three formats, namely lightable-minimal, lightable-classic, lightable-material and lightable-material-dark with hover and striped options.

**Usage**

```r
kable_classic(
  kable_input,
  lightable_options = "basic",
  html_font = "\"Arial Narrow\", \"Source Sans Pro\", sans-serif",
  ...
)
```

```r
kable_classic_2(
  kable_input,
  lightable_options = "basic",
  html_font = "\"Arial Narrow\", \"Source Sans Pro\", sans-serif",
  ...
)
```
kable_styling

...)

kable_minimal(
  kable_input,
  lightable_options = "basic",
  html_font = ""Trebuchet MS", verdana, sans-serif",
  ...
)

kable_material(
  kable_input,
  lightable_options = "basic",
  html_font = ""Source Sans Pro", helvetica, sans-serif",
  ...
)

kable_material_dark(
  kable_input,
  lightable_options = "basic",
  html_font = ""Source Sans Pro", helvetica, sans-serif",
  ...
)

kable_paper(
  kable_input,
  lightable_options = "basic",
  html_font = ""Arial Narrow", arial, helvetica, sans-serif",
  ...
)

Arguments

  kable_input  A HTML kable object.
  lightable_options
    Options to customize lightable. Similar with bootstrap_options in kable_styling.
    Choices include basic, striped and hover.
  html_font  A string for HTML css font. For example, html_font = ""Arial Narrow", arial, helvetica, sans-serif".  
  ...  Everything else you need to specify in kable_styling.
Description

This function provides a cleaner approach to modify the style of HTML tables other than using the table.attr option in knitr::kable(). Note that those bootstrap options requires Twitter bootstrap theme, which is not available in some customized template being loaded.

Usage

```r
kable_styling(
  kable_input,
  bootstrap_options = "basic",
  latex_options = "basic",
  full_width = NULL,
  position = "center",
  font_size = NULL,
  row_label_position = "l",
  repeat_header_text = \"\textit{(continued)}\",
  repeat_header_method = c("append", "replace"),
  repeat_header_continued = FALSE,
  stripe_color = "gray!10",
  stripe_index = NULL,
  latex_table_env = NULL,
  protect_latex = TRUE,
  table.envir = "table",
  fixed_thead = FALSE,
  htmltable_class = NULL,
  html_font = NULL,
  wraptabwidth = "\0pt"
)
```

Arguments

- `kable_input` Output of knitr::kable() with format specified
- `bootstrap_options` A character vector for bootstrap table options. Please see package vignette or visit the w3schools' Bootstrap Page for more information. Possible options include basic, striped, bordered, hover, condensed, responsive and none.
- `latex_options` A character vector for LaTeX table options. Please see package vignette for more information. Possible options include basic, striped, hold_position, HOLD_position, scale_down, scale_up & repeat_header. striped will add alternative row colors to the table. It will imports LaTeX package xcolor if enabled. hold_position will "hold" the floating table to the exact position. It is useful when the LaTeX table is contained in a table environment after you specified captions in kable(). It will force the table to stay in the position where it was created in the document. A stronger version: HOLD_position requires the float package and specifies [H]. scale_down is useful for super wide table. It will automatically adjust the table to page width. repeat_header in only meaningful in a longtable environment. It will let the header row repeat on every page in that long table.
full_width  A TRUE or FALSE variable controlling whether the HTML table should have 100% the preferable format for full_width. If not specified, a HTML table will have full width by default but this option will be set to FALSE for a LaTeX table.

position  A character string determining how to position the table on a page. Possible values include left, center, right, float_left and float_right. Please see the package doc site for demonstrations. For a LaTeX table, if float_* is selected, LaTeX package wrapfig will be imported.

font_size  A numeric input for table font size

row_label_position  A character string determining the justification of the row labels in a table. Possible values include l for left, c for center, and r for right. The default value is l for left justification.

repeat_header_text  LaTeX option. A text string you want to append on or replace the caption.

repeat_header_method  LaTeX option, can either be append(default) or replace

repeat_header_continued  T/F or a text string. Whether or not to put a continued mark on the second page of longtable. If you put in text, we will use this text as the "continued" mark.

stripe_color  LaTeX option allowing users to pick a different color for their strip lines. This option is not available in HTML.

stripe_index  LaTeX option allowing users to customize which rows should have stripe color.

latex_table_env  LaTeX option. A character string to define customized table environment such as tabu or tabularx. You shouldn’t expect all features could be supported in self-defined environments.

protect_latex  If TRUE, LaTeX code embedded between dollar signs will be protected from HTML escaping.

table.envir  LaTeX floating table environment. kable_style will put a plain no-caption table in a table environment in order to center the table. You can specify this option to things like table* or float* based on your need.

fixed_thead  HTML table option so table header row is fixed at top. Values can be either T/F or list(enabled = T/F, background = "anycolor").

htmltable_class  Options to use the in-house lightable themes. Choices include lightable-minimal, lightable-classic, lightable-classic-2, lightable-material, lightable-striped and lightable-hover. If you have your customized style sheet loaded which defines your own table class, you can also load it here.

html_font  A string for HTML css font. For example, html_font = "'Arial Narrow", arial, helvetica, sans-serif'.

wraptable_width  Width of the wraptable area if you specify "float_left/right" for latex table. Default is "0pt" for automated determination but you may specify it manually.
Details

For LaTeX, if you use other than English environment

- all tables are converted to 'UTF-8'. If you use, for example, Hungarian characters on a Windows machine, make sure to use Sys.setlocale("LC_ALL","Hungarian") to avoid unexpected conversions.
- protect_latex = TRUE has no effect.

For HTML,

- protect_latex = TRUE is for including complicated math in HTML output. The LaTeX may not include dollar signs even if they are escaped. Pandoc's rules for recognizing embedded LaTeX are used.

Examples

```r
## Not run:
x_html <- knitr::kable(head(mtcars), "html")
kable_styling(x_html, "striped", position = "left", font_size = 7)

x_latex <- knitr::kable(head(mtcars), "latex")
kable_styling(x_latex, latex_options = "striped", position = "float_left")

## End(Not run)
```

---

kbl

Wrapper function of knitr::kable

Description

The knitr::kable() function is the foundation of this package. However, it has many latex/html specific arguments hidden under the ground unless you check its source code. This wrapper function is created to provide better documentation (and auto-complete yay) and at the same time, solve the auto format setting in a better way.

Usage

```r
kbl(
x,
format,
digits =getOption("digits"),
row.names = NA,
col.names = NA,
align,
caption = NULL,
label = NULL,
format.args = list(),
```
escape = TRUE,
  table.attr = knitr::getOption("knitr.table.html.attr", ""),
  booktabs = FALSE,
  longtable = FALSE,
  tabular = if (longtable) "longtable" else "tabular",
  valign = if (tabular %in% c("tabularx", "xltabular")) "{\linewidth}" else "[t]",
  position = "",
  centering = TRUE,
  vline = knitr::getOption("knitr.table.vline", if (booktabs) "" else "|"),
  toprule = knitr::getOption("knitr.table.toprule", if (booktabs) "\toprule" else "\hline"),
  bottomrule = knitr::getOption("knitr.table.bottomrule", if (booktabs) "\bottomrule" else "\hline"),
  midrule = knitr::getOption("knitr.table.midrule", if (booktabs) "\midrule" else "\hline"),
  linesep = if (booktabs) c("", "", "", "", "\addlinespace") else "\hline",
  caption.short = "",
  table.envir = if (!is.null(caption)) "table",
  ...
)

Arguments

- **x** For `kable()`, `x` is an R object, which is typically a matrix or data frame. For `kables()`, a list with each element being a returned value from `kable()`.

- **format** A character string. Possible values are `latex`, `html`, `pipe` (Pandoc’s pipe tables), `simple` (Pandoc’s simple tables), `rst`, `jira`, and `org` (Emacs Org-mode). The value of this argument will be automatically determined if the function is called within a `knitr` document. The `format` value can also be set in the global option `knitr.table.format`. If `format` is a function, it must return a character string.

- **digits** Maximum number of digits for numeric columns, passed to `round()`. This can also be a vector of length `ncol(x)`, to set the number of digits for individual columns.

- **row.names** Logical: whether to include row names. By default, row names are included if `rownames(x)` is neither `NULL` nor identical to `1:nrow(x)`.

- **col.names** A character vector of column names to be used in the table.

- **align** Column alignment: a character vector consisting of 'l' (left), 'c' (center) and/or 'r' (right). By default or if `align = NULL`, numeric columns are right-aligned, and other columns are left-aligned. If `length(align) == 1L`, the string will be expanded to a vector of individual letters, e.g. 'clc' becomes c('c', 'l', 'c'), unless the output format is LaTeX.

- **caption** The table caption.

- **label** The table reference label. By default, the label is obtained from `knitr::opts_current$get('label'). To disable the label, use `label = NA`.

- **format.args** A list of arguments to be passed to `format()` to format table values, e.g. `list(big.mark = ,')`.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>escape</code></td>
<td>Boolean; whether to escape special characters when producing HTML or LaTeX tables. When <code>escape = FALSE</code>, you have to make sure that special characters will not trigger syntax errors in LaTeX or HTML.</td>
<td><code>kbl</code></td>
</tr>
<tr>
<td><code>table.attr</code></td>
<td>A character string for additional HTML table attributes. This is convenient if you simply want to add a few HTML classes or styles. For example, you can put <code>'class=&quot;table&quot; style=&quot;color: red&quot;'</code>.</td>
<td></td>
</tr>
<tr>
<td><code>booktabs</code></td>
<td>T/F for whether to enable the booktabs format for tables. I personally would recommend you turn this on for every LaTeX table except some special cases.</td>
<td></td>
</tr>
<tr>
<td><code>longtable</code></td>
<td>T/F for whether to use the longtable format. If you have a table that will span over two or more pages, you will have to turn this on.</td>
<td></td>
</tr>
<tr>
<td><code>tabular</code></td>
<td>The &quot;inner environment&quot; to use for the table, e.g. &quot;tabularx&quot;.</td>
<td></td>
</tr>
<tr>
<td><code>valign</code></td>
<td>You probably won’t need to adjust this LaTeX option very often. If you are familiar with LaTeX tables, this is the optional position for the tabular environment controlling the vertical position of the table relative to the baseline of the surrounding text. Possible choices are b, c and t (default).</td>
<td></td>
</tr>
<tr>
<td><code>position</code></td>
<td>This is the &quot;real&quot; or say floating position for the LaTeX table environment. The <code>kable</code> only puts tables in a table environment when a caption is provided. That is also the reason why your tables will be floating around if you specify captions for your table. Possible choices are h (here), t (top, default), b (bottom) and p (on a dedicated page).</td>
<td></td>
</tr>
<tr>
<td><code>centering</code></td>
<td>T (default)/F. Whether to center tables in the table environment.</td>
<td></td>
</tr>
<tr>
<td><code>vline</code></td>
<td>vertical separator. Default is nothing for booktabs tables but &quot;&quot; for normal tables.</td>
<td></td>
</tr>
<tr>
<td><code>toprule</code></td>
<td>toprule. Default is hline for normal table but toprule for booktabs tables.</td>
<td></td>
</tr>
<tr>
<td><code>bottomrule</code></td>
<td>bottomrule. Default is hline for normal table but bottomrule for booktabs tables.</td>
<td></td>
</tr>
<tr>
<td><code>midrule</code></td>
<td>midrule. Default is hline for normal table but midrule for booktabs tables.</td>
<td></td>
</tr>
<tr>
<td><code>linesep</code></td>
<td>By default, in booktabs tables, <code>kable</code> insert an extra space every five rows for clear display. If you don’t want this feature or if you want to do it in a different pattern, you can consider change this option. The default is c(&quot;&quot;, &quot;,&quot;, &quot;,&quot;, &quot;,&quot;addlinespace&quot;). Also, if you are not using booktabs, but you want a cleaner display, you can change this to &quot;,&quot;.</td>
<td></td>
</tr>
<tr>
<td><code>caption.short</code></td>
<td>Another LaTeX feature. Short captions for tables</td>
<td></td>
</tr>
<tr>
<td><code>table.envir</code></td>
<td>You probably don’t need to change this as well. The default setting is to put a table environment outside of tabular if a caption is provided.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Other arguments (see Examples and References).</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The current set of arguments were written for knitr version 1.45. If you are using an older or newer version, some of the default values may be different.

In knitr::kable(), the escape parameter does not affect the text in the caption argument, and `kbl()` inherits this behavior. This means that special characters in the caption (such as "\%" for LaTeX output) need to be escaped by the user, e.g. written as "\\%".
landscape  

Print the table on an isolated landscape page in PDF

Description

This function will put the table on a single landscape page. It's useful for wide tables that can't be printed on a portrait page.

Usage

landscape(kable_input, margin = NULL)

Arguments

- **kable_input**: Output of `knitr::kable()` with format specified.
- **margin**: Customizable page margin for special needs. Values can be "1cm", "1in" or similar.

Examples

```r
## Not run:
landscape(knitr::kable(head(mtcars), "latex"))
## End(Not run)
```

linebreak  

Make linebreak in LaTeX Table cells

Description

This function generates LaTeX code of `makecell` so that users can have linebreaks in their table.

Usage

```r
linebreak(x, align = c("l", "c", "r"), double_escape = F, linebreaker = "\n")
```

Arguments

- **x**: A character vector.
- **align**: Choose from "l", "c" or "r". Defaults to "l".
- **double_escape**: Whether special character should be double escaped. Default is FALSE.
- **linebreaker**: Symbol for linebreaks to replace. Default is \n.
listify_args

Convert arguments for a single call into Map-able args

Description

Convert arguments for a single call into Map-able args

Usage

listify_args(
  ..., 
  lengths = NA, 
  passthru = c("x", "y"), 
  notlen1vec = c("lim", "xlim", "ylim"), 
  notlen1lst = c("minmax", "min", "max"), 
  ignore = c("same_lim")
)

Arguments

... Arbitrary arguments to be possibly converted into lists of arguments.
lengths Allowable lengths of the arguments, typically 1 and the length of the main variable (e.g., "x"). If NA (default), it is not enforced.
passthru Character vector of variables to pass through with no conversion to lists of values. Extra names (not provided in ...) are ignored.
notlen1vec Character vector of variables that are known to be length over 1 for a single plot call, so it will always be list-ified and extra care to ensure it is grouped correctly. Extra names (not provided in ...) are ignored.
notlen1lst Character vector of variables that are lists, so the inner list length is not checked/enforced. (For example, if a single plot call takes an argument list(a=1,b=2,d=3) and the multi-data call creates three plots, then a naive match might think that the first plot would get list(a=1), second plot gets list(b=2), etc. Adding that list-argument to this 'notlen1lst' will ensure that the full list is passed correctly.) Extra names (not provided in ...) are ignored.
ignore Character vector of variables to ignore, never returned. (Generally one can control this by not adding the variable in the first place, but having this here allows some sanity checks and/or programmatic usage.)

Value

list, generally a list of embedded lists
magic_mirror  

*Magic mirror that returns kable’s attributes*

**Description**

Mirror mirror tell me, how does this kable look like?

**Usage**

```r
magic_mirror(kable_input)
```

**Arguments**

- `kable_input` The output of kable

**Examples**

```r
magic_mirror(knitr::kable(head(mtcars), "html"))
```

---

**make_inline_plot**

*Combine file (or svg text) and parameters into a kableExtraInlinePlots object*

**Description**

Combine file (or svg text) and parameters into a kableExtraInlinePlots object

**Usage**

```r
make_inline_plot(filename, file_ext, dev, width, height, res, del = TRUE)
```

**Arguments**

- `filename` Passed through to the graphics device.
- `file_ext` Character, something like "png".
- `dev` Character (e.g., "svg", "pdf") or function (e.g.,
- `width, height` Plot dimensions in pixels.
- `res` The resolution of the plot; default is 300.
- `del` If the file is svg-like, then the default action is to read the file into an embedded SVG object; once done, the file is no longer used. The default action is to delete this file early, set this to ‘FALSE’ to keep the file.

**Value**

list object, with class kableExtraInlinePlots
### remove_column

**Remove columns**

**Description**

Remove columns

**Usage**

```r
remove_column(kable_input, columns)
```

**Arguments**

- `kable_input`: Output of `knitr::kable()` with format specified
- `columns`: A numeric value or vector indicating in which column(s) rows need to be removed

**Examples**

```r
## Not run:
remove_column(kable(mtcars), 1)
## End(Not run)
```

### rmd_format

**R Markdown Format**

**Description**

Check if the export format of the R Markdown document exists.

**Usage**

```r
rmd_format()
```
Specify the look of the selected row

**Description**

This function allows users to select a row and then specify its look. It can also specify the format of the header row when \( \text{row} = 0 \).

**Usage**

```r
row_spec(  
kable_input,  
row,  
bold = FALSE,  
italic = FALSE,  
monospace = FALSE,  
underline = FALSE,  
strikeout = FALSE,  
color = NULL,  
background = NULL,  
align = NULL,  
font_size = NULL,  
angle = NULL,  
extra_css = NULL,  
hline_after = FALSE,  
extra_latex_after = NULL
)
```

**Arguments**

- `kable_input`: Output of `knitr::kable()` with format specified
- `row`: A numeric value or vector indicating which row(s) to be selected. You don’t need to count in header rows or group labeling rows.
- `bold`: A T/F value to control whether the text of the selected row need to be bolded.
- `italic`: A T/F value to control whether the text of the selected row need to be emphasized.
- `monospace`: A T/F value to control whether the text of the selected row need to be monospaced (verbatim)
- `underline`: A T/F value to control whether the text of the selected row need to be underlined
- `strikeout`: A T/F value to control whether the text of the selected row need to be struck out.
- `color`: A character string for row text color. For example, "red" or 
  "#BBBBBB".
- `background`: A character string for row background color. Here please pay attention to the differences in color codes between HTML and LaTeX.
align  A character string for cell alignment. For HTML, possible values could be l, c, r plus left, center, right, justify, initial and inherit while for LaTeX, you can only choose from l, c & r.

font_size  A numeric input for font size. For HTML, you can also use options including xx-small, x-small, small, medium, large, x-large, xx-large, smaller, larger, initial and inherit.

angle  0-360, degree that the text will rotate.

extra_css  Extra css text to be passed into the cells of the row. Note that it’s not for the whole row.

hline_after  T/F. A replicate of hline.after in xtable. It adds a hline after the row.

extra_latex_after  Extra LaTeX text to be added after the row. Similar with add.to.row in xtable

Examples

```r
## Not run:
x <- knitr::kable(head(mtcars), "html")
row_spec(x, 1:2, bold = TRUE, italic = TRUE)
## End(Not run)
```

save_kable  Save kable to files

Description

Save kable to files

Usage

```r
save_kable(
x,
file,
bs_theme = "simplex",
self_contained = TRUE,
extra_dependencies = NULL,
...,
latex_header_includes = NULL,
keep_tex = FALSE,
density = 300
)
```
scroll_box

Put a HTML table into a scrollable box

Description

This function will put a HTML kable object in a fixed-height, fixed-width or both box and make it scrollable.

Usage

scroll_box(
  kable_input,
  height = NULL,
  width = NULL,
spec_angle

Generate rotation angle for continuous values

Usage

```r
spec_angle(x, begin, end, scale_from = NULL)
```

Arguments

- `x`: continuous vectors of values
- `begin`: Smallest degree to rotate. Default is 0
- `end`: Largest degree to rotate. Default is 359.
- `scale_from`: input range (vector of length two). If not given, is calculated from the range of `x`
Helper functions to generate inline sparklines

Description
These functions help you quickly generate sets of sparkline style plots using base R plotting system. Currently, we support histogram, boxplot, line, scatter and pointrange plots. You can use them together with \texttt{column_spec} to generate inline plot in tables. By default, this function will save images in a folder called “kableExtra” and return the address of the file.

Usage

\begin{verbatim}
spec_boxplot(
  x,  
  width = 200, 
  height = 50, 
  res = 300, 
  add_label = FALSE, 
  label_digits = 2, 
  same_lim = TRUE, 
  lim = NULL, 
  xaxt = "n", 
  yaxt = "n", 
  ann = FALSE, 
  col = "lightgray", 
  border = NULL, 
  boxlty = 0, 
  medcol = "red", 
  medlwd = 1, 
  dir = if (is_latex()) rmd_files_dir() else tempdir(), 
  file = NULL, 
  file_type = if (is_latex()) "pdf" else svglite::svglite, 
\ldots
)
\end{verbatim}

Arguments
\begin{itemize}
  \item \texttt{x} Vector of values or List of vectors of values.
  \item \texttt{width} The width of the plot in pixel
  \item \texttt{height} The height of the plot in pixel
  \item \texttt{res} The resolution of the plot. Default is 300.
  \item \texttt{add_label} For boxplot. \texttt{T/F} to add labels for min, mean and max.
  \item \texttt{label_digits} If \texttt{T} for \texttt{add_label}, rounding digits for the label. Default is 2.
  \item \texttt{same_lim} \texttt{T/F}. If \texttt{x} is a list of vectors, should all the plots be plotted in the same range? Default is True.
\end{itemize}
spec_color

Generate viridis or other color code for continuous values

Description

Generate viridis or other color code for continuous values

Usage

```r
spec_color(
  x,
  alpha = 1,
  begin = 0,
  end = 1,
  direction = 1,
  option = "D",
  na_color = "#BBBBBB",
  scale_from = NULL,
  palette = viridisLite::viridis(256, alpha, begin, end, direction, option)
)
```

Arguments

- **x**: continuous vectors of values
- **alpha**: The alpha transparency, a number in [0,1],
- **begin**: The (corrected) hue in [0,1] at which the color map begins.
- **end**: The (corrected) hue in [0,1] at which the color map ends.
direction Sets the order of colors in the scale. If 1, the default, colors are ordered from darkest to lightest. If -1, the order of colors is reversed.

option A character string indicating the color map option to use. Eight options are available: "magma" (or "A"), "inferno" (or "B"), "plasma" (or "C"), "viridis" (or "D"), "cividis" (or "E"), "rocket" (or "F"), "mako" (or "G") and "turbo" (or "H").

na_color color code for NA values

scale_from input range (vector of length two). If not given, is calculated from the range of x

palette The palette to use as a character vector of colors. If this is specified, parameters other than x, na_color and scale_from are ignored.

---

**spec_font_size**

*Generate common font size for continuous values*

**Description**

Generate common font size for continuous values

**Usage**

```
spec_font_size(x, begin = 8, end = 16, na_font_size = 12, scale_from = NULL)
```

**Arguments**

- `x` continuous vectors of values
- `begin` Smallest font size to be used. Default is 10.
- `end` Largest font size. Default is 20.
- `na_font_size` font size for NA values
- `scale_from` input range (vector of length two). If not given, is calculated from the range of x

---

**spec_hist**

*Helper functions to generate inline sparklines*

**Description**

These functions help you quickly generate sets of sparkline style plots using base R plotting system. Currently, we support histogram, boxplot, line, scatter and pointrange plots. You can use them together with column_spec to generate inline plot in tables. By default, this function will save images in a folder called "kableExtra" and return the address of the file.
Usage

```r
spec_hist(
  x,
  width = 200,
  height = 50,
  res = 300,
  breaks = "Sturges",
  same_lim = TRUE,
  lim = NULL,
  xaxt = "n",
  yaxt = "n",
  ann = FALSE,
  col = "lightgray",
  border = NULL,
  dir = if (is_latex()) rmd_files_dir() else tempdir(),
  file = NULL,
  file_type = if (is_latex()) "pdf" else svglite::svglite,
  ...
)
```

Arguments

- **x**: Vector of values or List of vectors of values.
- **width**: The width of the plot in pixel
- **height**: The height of the plot in pixel
- **res**: The resolution of the plot. Default is 300.
- **breaks**: The break option in `hist`. Default is "Sturges" but you can also provide a vector to manually specify break points.
- **same_lim**: T/F. If x is a list of vectors, should all the plots be plotted in the same range? Default is True.
- **lim**: Manually specify plotting range in the form of c(0, 10).
- **xaxt**: On/Off for xaxis text
- **yaxt**: On/Off for yaxis text
- **ann**: On/Off for annotations (titles and axis titles)
- **col**: Color for the fill of the histogram bar/boxplot box.
- **border**: Color for the border.
- **dir**: Directory of where the images will be saved.
- **file**: File name. If not provided, a random name will be used
- **file_type**: Graphic device. Can be character (e.g., "pdf") or a graphics device function (grDevices::pdf). This defaults to "pdf" if the rendering is in LaTeX and "svg" otherwise. for HTML output
- **...**: extra parameters sending to `hist()`
**spec_image**

**Description**

Users can directly provide image file path to column spec. However, if you need to specify the size of the image, you will need this function.

**Usage**

```r
spec_image(path, width, height, res = 300, svg_text = NULL)
```

**Arguments**

- **path**: file path(s)
- **width**: image width in pixel
- **height**: image height in pixel
- **res**: image resolution.
- **svg_text**: If you have the raw text for SVG. Put them here

---

**spec_plot**

**Helper functions to generate inline sparklines**

**Description**

These functions help you quickly generate sets of sparkline style plots using base R plotting system. Currently, we support histogram, boxplot, line, scatter and pointrange plots. You can use them together with `column_spec` to generate inline plot in tables. By default, this function will save images in a folder called "kableExtra" and return the address of the file.

**Usage**

```r
spec_plot(
x,
y = NULL,
width = 200,
height = 50,
res = 300,
same_lim = TRUE,
xlim = NULL,
ylim = NULL,
xaxt = "n",
yaxt = "n",
ann = FALSE,
```
col = "lightgray",
border = NULL,
frame.plot = FALSE,
lwd = 2,
pch = ".",
cex = 2,
type = "l",
polymin = NA,
minmax = list(pch = ".", cex = cex, col = "red"),
min = minmax,
max = minmax,
dir = if (is_latex()) rmd_files_dir() else tempdir(),
file = NULL,
file_type = if (is_latex()) "pdf" else svglite::svglite,

Arguments

x, y  Vector of values or List of vectors of values. y is optional.
width  The width of the plot in pixel
height  The height of the plot in pixel
res  The resolution of the plot. Default is 300.
same_lim  T/F. If x is a list of vectors, should all the plots be plotted in the same range? Default is True.
xlim, ylim  Manually specify plotting range in the form of c(0, 10).
xaxt  On/Off for xaxis text
yaxt  On/Off for yaxis text
ann  On/Off for annotations (titles and axis titles)
col  Color for the fill of the histogram bar/boxplot box.
border  Color for the border.
frame.plot  On/Off for surrounding box (spec_plot only). Default is False.
lwd  Line width for spec_plot; within spec_plot, the minmax argument defaults to use this value for cex for points. Default is 2.
pch, cex  Shape and size for points (if type is other than "l").
type  Passed to plot, often one of "l", "p", or "b", see graphics::plot.default() for more details. Ignored when polymin is not NA.
polymin  Special argument that converts a "line" to a polygon, where the flat portion is this value, and the other side of the polygon is the 'y' value ('x' if no 'y' provided). If NA (the default), then this is ignored; otherwise if this is numeric then a polygon is created (and 'type' is ignored). Note that if polymin is in the middle of the 'y' values, it will generate up/down polygons around this value.
**Description**

These functions help you quickly generate sets of sparkline style plots using base R plotting system. Currently, we support histogram, boxplot, line, scatter and pointrange plots. You can use them together with `column_spec` to generate inline plot in tables. By default, this function will save images in a folder called "kableExtra" and return the address of the file.

**Usage**

```r
spec_pointrange(
  x, 
  xmin, 
  xmax, 
  vline = NULL, 
  width = 200, 
  height = 50, 
  res = 300, 
  same_lim = TRUE, 
  lim = NULL, 
  xaxt = "n", 
  yaxt = "n", 
  ann = FALSE, 
  col = "red", 
  line_col = "black", 
  cex = 0.3, 
  frame.plot = FALSE, 
  dir = if (is_latex()) rmd_files_dir() else tempdir(), 
  file = NULL, 
  file_type = if (is_latex()) "pdf" else svglite::svglite, 
  ... 
)
```
spec_popover

Arguments

- **x, xmin, xmax**: A scalar value or List of scalar values for dot, left and right error bar.
- **vline**: A scalar value for where to draw a vertical line.
- **width**: The width of the plot in pixel
- **height**: The height of the plot in pixel
- **res**: The resolution of the plot. Default is 300.
- **same_lim**: T/F. If x is a list of vectors, should all the plots be plotted in the same range? Default is True.
- **lim**: Manually specify plotting range in the form of c(0, 10).
- **xaxt**: On/Off for xaxis text
- **yaxt**: On/Off for yaxis text
- **ann**: On/Off for annotations (titles and axis titles)
- **col**: Color for mean dot.
- **line_col**: Color for the line and the error bar.
- **cex**: size of the mean dot and error bar size.
- **frame.plot**: T/F for whether to plot the plot frames.
- **dir**: Directory of where the images will be saved.
- **file**: File name. If not provided, a random name will be used
- **file_type**: Graphic device. Can be character (e.g., "pdf") or a graphics device function (grDevices::pdf). This defaults to "pdf" if the rendering is in LaTeX and "svg" otherwise. For HTML output
- **...**: extra parameters sending to hist()

Description

Setup bootstrap popover

Usage

```r
spec_popover(
  content = NULL,
  title = NULL,
  trigger = "hover",
  position = "right"
)
```
**spec_tooltip**

**Arguments**

- `content`: content for pop-over message
- `title`: title for pop-over message.
- `trigger`: Controls how the pop-over message should be triggered. Possible values include hover (default), click, focus and manual.
- `position`: How the tooltip should be positioned. Possible values are right (default), top, bottom, left & auto.

**Description**

Setup bootstrap tooltip

**Usage**

```r
spec_tooltip(title, position = "right")
```

**Arguments**

- `title`: text for hovering message
- `position`: How the tooltip should be positioned. Possible values are right (default), top, bottom, left & auto.

---

**usepackage_latex**

*Load a LaTeX package*

**Description**

Load a LaTeX package using R code. Just like `\usepackage{}` in LaTeX

**Usage**

```r
usepackage_latex(name, options = NULL)
```

**Arguments**

- `name`: The LaTeX package name
- `options`: The LaTeX options for the package

**Examples**

```r
usepackage_latex("xcolor")
```
use_latex_packages  

Declare LaTeX packages needed by kableExtra

Description

Declares all of the LaTeX packages that may be used by kableExtra functions so that they will be loaded when the document is produced.

Usage

use_latex_packages()

Details

When kableExtra loads, it calls this function if it detects that knitr is running and producing LaTeX output. However, sometimes kableExtra is loaded before knitr runs, and then these packages can end up being missed, leading to LaTeX errors such as "Undefined control sequence." (See Github issue #721 for an example.)

Our kbl() wrapper for knitr::kable() calls this function for LaTeX output, so an explicit call is not necessary.

Examples

use_latex_packages()

xml_as_kable

Convert XML back to kable

Description

Convert XML back to kable

Usage

xml_as_kable(x)

Arguments

x  
XML table object
xtable2kable

Convert xtable to a kable object

Description

This function allow users to turn an xtable object into a kable so they can use most of kableExtra’s functions with their xtable code without making too many changes. Note that although I tested many cases and it seems to work, this function may not be functional in some other cases. I’m not a regular xtable user and can only provide very limited support for this function.

You should use this table in the same way as `print.xtable`. All the options you provided to this function will be sent to `print.xtable`. Instead of printing out the result, this function will return the LaTeX or HTML as text and a kable object.

Usage

```r
xtable2kable(x, ...)```

Arguments

- `x` an xtable object
- `...` options for `print.xtable`

Examples

```r
## Not run:
library(xtable)
xtab <- mtcars %>%
  xtable() %>%
  xtable2kable(booktabs = TRUE) %>%
  kable_styling(latex_options = "striped")

## End(Not run)
```
