Package ‘koRpus’

October 13, 2022

Type Package

Title Text Analysis with Emphasis on POS Tagging, Readability, and Lexical Diversity

Description A set of tools to analyze texts. Includes, amongst others, functions for automatic language detection, hyphenation, several indices of lexical diversity (e.g., type token ratio, HD-D/vocd-D, MTLD) and readability (e.g., Flesch, SMOG, LIX, Dale-Chall). Basic import functions for language corpora are also provided, to enable frequency analyses (supports Celex and Leipzig Corpora Collection file formats) and measures like tf-idf. Note: For full functionality a local installation of TreeTagger is recommended. It is also recommended to not load this package directly, but by loading one of the available language support packages from the 'l10n' repository <https://undocumeantit.github.io/repos/l10n/>. 'koRpus' also includes a plugin for the R GUI and IDE RKWard, providing graphical dialogs for its basic features. The respective R package 'rkward' cannot be installed directly from a repository, as it is a part of RKWard. To make full use of this feature, please install RKWard from <https://rkward.kde.org> (plugins are detected automatically). Due to some restrictions on CRAN, the full package sources are only available from the project homepage. To ask for help, report bugs, request features, or discuss the development of the package, please subscribe to the koRpus-dev mailing list <https://korpusml.reaktanz.de>.

ARI

Readability: Automated Readability Index (ARI)

Description

This is just a convenient wrapper function for `readability`.

Usage

```r
ARI(txt.file, parameters = c(asl = 0.5, awl = 4.71, const = 21.43), ...)
```

Arguments

- `txt.file`: Either an object of class `kRp.text`, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- `parameters`: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- `...`: Further valid options for the main function, see `readability` for details.

Details

Calculates the Automated Readability Index (ARI). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

If `parameters="NRI"`, the simplified parameters from the Navy Readability Indexes are used, if set to `ARI="simple"`, the simplified formula is calculated.

This formula doesn’t need syllable count.

Value

An object of class `kRp.readability`.

References

Examples

```r
## Not run:
ARI(tagged.text)
```

```r
## End(Not run)
```
available.koRpus.lang  List available language packages

Description
Get a list of all currently available language packages for koRpus from the official l10n repository.

Usage
available.koRpus.lang(repos = "https://undocumeantit.github.io/repos/l10n/"

Arguments
repos The URL to additional repositories to query. You should probably leave this to the default, but if you would like to use a third party repository, you're free to do so. The value is temporarily appended to the repos currently returned by getOption("repos").

Details
koRpus' language support is modular by design, meaning you can (and must) load an extension package for each language you want to work with in a given session. These language support packages are named koRpus.lang.**, where ** is replaced by a valid language identifier (like en for English or de for German). See set.lang.support for more details.

This function downloads the package list from (also) the official localization repository for koRpus and lists all currently available language packages that you could install and load. Apart from than it does not download or install anything.

You can install the packages by either calling the convenient wrapper function install.koRpus.lang, or install.packages (see examples).

Value
Returns an invisible character vector with all available language packages.

See Also
install.koRpus.lang

Examples
## Not run:
# see all available language packages
available.koRpus.lang()

# install support for German
install.koRpus.lang("de")
# alternatively, you could call install.packages directly
install.packages("koRpus.lang.de", repos="https://undocumeantit.github.io/repos/l10n/"")
### bormuth

**Readability: Bormuth's Mean Cloze and Grade Placement**

**Description**

This is just a convenient wrapper function for `readability`.

**Usage**

```r
bormuth(txt.file, word.list, clz=35,
       meanc=c(const=0.886593, awl=0.08364, afw=0.161911,
                asl1=0.021401, asl2=0.000577, asl3=0.000005),
                grade=c(const=4.275, m1=12.834, m2=34.934, m3=20.388,
                         c1=26.194, c2=2.046, c3=11.767, mc1=44.285, mc2=97.62,
                         mc3=59.538), ...)
```

**Arguments**

- `txt.file`: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- `word.list`: A vector or matrix (with exactly one column) which defines familiar words. For valid results the long Dale-Chall list with 3000 words should be used.
- `clz`: Integer, the cloze criterion score in percent.
- `meanc`: A numeric vector with named magic numbers, defining the relevant parameters for Mean Cloze calculation.
- `grade`: A numeric vector with named magic numbers, defining the relevant parameters for Grade Placement calculation. If omitted, Grade Placement will not be calculated.
- `...`: Further valid options for the main function, see `readability` for details.

**Details**

Calculates Bormuth’s Mean Cloze and estimated grade placement. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

**Value**

An object of class `kRp.readability`. 
Examples

## Not run:
bormuth(tagged.text, word.list=new.dale.chall.wl)

## End(Not run)

C.ld

*Lexical diversity: Herdan’s C*

Description

This is just a convenient wrapper function for `lex.div`.

Usage

```r
C.ld(txt, char = FALSE, ...)
```

Arguments

- `txt`: An object of class `kRp.text` containing the tagged text to be analyzed.
- `char`: Logical, defining whether data for plotting characteristic curves should be calculated.
- `...`: Further valid options for the main function, see `lex.div` for details.

Details

Calculates Herdan’s C. In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the C value, and characteristics are off by default.

Value

An object of class `kRp.TTR`.

See Also

`kRp.POS.tags, kRp.text, kRp.TTR`

Examples

## Not run:
C.ld(tagged.text)

## End(Not run)
Transform text into cloze test format

Description

If you feed a tagged text object to this function, its text will be transformed into a format used for cloze deletion tests. That is, by default every fifth word (or as specified by every) will be replaced by a line. You can also set an offset value to specify where to begin.

Usage

clozeDelete(obj, ...)

## S4 method for signature 'kRp.text'
clozeDelete(obj, every = 5, offset = 0, replace.by = "_", fixed = 10)

Arguments

obj An object of class kRp.text.

... Additional arguments to the method (as described in this document).

every Integer numeric, setting the frequency of words to be manipulated. By default, every fifth word is being transformed.

offset Either an integer numeric, sets the number of words to offset the transformations. Or the special keyword "all", which will cause the method to iterate through all possible offset values and not return an object, but print the results (including the list with changed words).

replace.by Character, will be used as the replacement for the removed words.

fixed Integer numeric, defines the length of the replacement (replace.by will be repeated this much times). If set to 0, the replacement will be as long as the replaced word.

Details

The option offset="all" will not return one single object, but print the results after iterating through all possible offset values.

Value

An object of class kRp.text with the added feature diff.

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt")
coleman

)`

tokenized.obj <- tokenize(
  txt=sample_file,
  lang="en"
)
tokenized.obj <- clozeDelete(tokenized.obj)
pasteText(tokenized.obj)

# diff stats are now part of the object
hasFeature(tokenized.obj)
diffText(tokenized.obj)
} else {}

coleman                Readability: Coleman's Formulas

Description

This is just a convenient wrapper function for readability.

Usage

coleman(
  txt.file,
  hyphen = NULL,
  parameters = c(syll = 1),
  clz1 = c(word = 1.29, const = 38.45),
  clz2 = c(word = 1.16, sntc = 1.48, const = 37.95),
  clz3 = c(word = 1.07, sntc = 1.18, pron = 0.76, const = 34.02),
  clz4 = c(word = 1.04, sntc = 1.06, pron = 0.56, prep = 0.36, const = 26.01),
  ...)

Arguments

txt.file          Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.
hyphen            An object of class kRp.hyphen. If NULL, the text will be hyphenated automatically.
parameters        A numeric vector with named magic numbers, defining the relevant parameters for all formulas of the index.
clz1              A numeric vector with named magic numbers for the first formula.
clz2              A numeric vector with named magic numbers for the second formula.
clz3              A numeric vector with named magic numbers for the third formula.
clz4              A numeric vector with named magic numbers for the fourth formula.
...                Further valid options for the main function, see readability for details.
Details

This function calculates the four readability formulas by Coleman. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

Value

An object of class `kRp.readability`.

Examples

```r
## Not run:
coleman(tagged.text)
## End(Not run)
```

documentation for `coleman.liau`

Description

This is just a convenient wrapper function for `readability`.

Usage

```r
coleman.liau( 
  txt.file, 
  ecp = c(const = 141.8401, char = 0.21459, sntc = 1.079812), 
  grade = c(ecp = -27.4004, const = 23.06395), 
  short = c(awl = 5.88, spw = 29.6, const = 15.8), 
  ... 
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>txt.file</code></td>
<td>Either an object of class <code>kRp.text</code>, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by <code>readability.num</code>.</td>
</tr>
<tr>
<td><code>ecp</code></td>
<td>A numeric vector with named magic numbers, defining the relevant parameters for the cloze percentage estimate.</td>
</tr>
<tr>
<td><code>grade</code></td>
<td>A numeric vector with named magic numbers, defining the relevant parameters to calculate grade equivalent for ECP values.</td>
</tr>
<tr>
<td><code>short</code></td>
<td>A numeric vector with named magic numbers, defining the relevant parameters for the short form of the formula.</td>
</tr>
<tr>
<td><code>...</code></td>
<td>Further valid options for the main function, see <code>readability</code> for details.</td>
</tr>
</tbody>
</table>
Details

Calculates the Coleman-Liau index. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

Value

An object of class `kRp.readability`.

Examples

```R
## Not run:
coleman.liau(tagged.text)
## End(Not run)
```

---

### correct.tag

Methods to correct koRpus objects

Description

The method `correct.tag` can be used to alter objects of class `kRp.text`.

Usage

```R
correct.tag(
    obj,
    row,
    tag = NULL,
    lemma = NULL,
    check.token = NULL,
    quiet = TRUE
)
```

```R
## S4 method for signature 'kRp.text'
correct.tag(
    obj,
    row,
    tag = NULL,
    lemma = NULL,
    check.token = NULL,
    quiet = TRUE
)
```
correct.tag

Arguments

obj
An object of class kRp.text.

row
Integer, the row number of the entry to be changed. Can be an integer vector to change several rows in one go.

tag
A character string with a valid POS tag to replace the current tag entry. If NULL (the default) the entry remains unchanged.

lemma
A character string naming the lemma to to replace the current lemma entry. If NULL (the default) the entry remains unchanged.

check.token
A character string naming the token you expect to be in this row. If not NULL, correct will stop with an error if this values don’t match.

quiet
If FALSE, messages about all applied changes are shown.

Details

Although automatic POS tagging and lemmatization are remarkably accurate, the algorithms do usually produce some errors. If you want to correct for these flaws, this method can be of help, because it might prevent you from introducing new errors. That is, it will do some sanity checks before the object is actually manipulated and returned.

correct.tag will read the lang slot from the given object and check whether the tag provided is actually valid. If so, it will not only change the tag field in the object, but also update wclass and desc accordingly.

If check.token is set it must also match token in the given row(s). Note that no check is done on the lemmata.

Value

An object of the same class as obj.

See Also

kRp.text, treetag, kRp.POS.tags.

Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  tokenized.obj <- correct.tag(tokenized.obj, row=6, tag="NN")
} else {}
cTest  

**Transform text into C-Test-like format**

**Description**

If you feed a tagged text object to this function, its text will be transformed into a format used for C-Tests:

- the first and last sentence will be left untouched (except if the start and stop values of the intact parameter are changed)
- of all other sentences, the second half of every 2nd word (or as specified by every) will be replaced by a line
- words must have at least min.length characters, otherwise they are skipped
- words an uneven number of characters will be replaced after the next character, i.e., a word with five characters will keep the first three and have the last two replaced

**Usage**

cTest(obj, ...)

```r
## S4 method for signature 'kRp.text'
cTest(
  obj,
  every = 2,
  min.length = 3,
  intact = c(start = 1, end = 1),
  replace.by = "_"
)
```

**Arguments**

- **obj**  
  An object of class kRp.text.

- **...**  
  Additional arguments to the method (as described in this document).

- **every**  
  Integer numeric, setting the frequency of words to be manipulated. By default, every other word is being transformed.

- **min.length**  
  Integer numeric, sets the minimum length of words to be considered (in letters).

- **intact**  
  Named vector with the elements start and end. Both must be integer values and define, which sentences are to be left untouched, counted in sentences from beginning and end of the text. The default is to ignore the first and last sentence.

- **replace.by**  
  Character, will be used as the replacement for the removed word halves.

**Value**

An object of class kRp.text with the added feature diff.
Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
    sample_file <- file.path(
        path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
    )
    tokenized.obj <- tokenize(
        txt=sample_file, 
        lang="en"
    )
    tokenized.obj <- cTest(tokenized.obj)
    pasteText(tokenized.obj)

    # diff stats are now part of the object
    hasFeature(tokenized.obj)
    diffText(tokenized.obj)
} else {} 
```

---

**CTTR**  
*Lexical diversity: Carroll’s corrected TTR (CTTR)*

**Description**

This is just a convenient wrapper function for `lex.div`.

**Usage**

```r
CTTR(txt, char = FALSE, ...) 
```

**Arguments**

- `txt`  
  An object of class `kRp.text` containing the tagged text to be analyzed.
- `char`  
  Logical, defining whether data for plotting characteristic curves should be calculated.
- `...`  
  Further valid options for the main function, see `lex.div` for details.

**Details**

Calculates Carroll’s corrected TTR (CTTR). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the CTTR value, and characteristics are off by default.

**Value**

An object of class `kRp.TTR`.

**See Also**

- `kRp.POS.tags`, `kRp.text`, `kRp.TTR`
Examples

## Not run:
CTTR(tagged.text)

## End(Not run)

dale.chall

### Description

This is just a convenient wrapper function for `readability`.

### Usage

dale.chall(
  txt.file, 
  word.list, 
  parameters = c(const = 64, dword = 0.95, asl = 0.69), 
  ... 
)

### Arguments

- **txt.file**: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- **word.list**: A vector or matrix (with exactly one column) which defines familiar words. For valid results the long Dale-Chall list with about 3000 words should be used.
- **parameters**: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- **...**: Further valid options for the main function, see `readability` for details.

### Details

Calculates the New Dale-Chall Readability Formula. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

If parameters="PSK", the parameters by Powers-Sumner-Kearl (1958) are used, and if parameters="old", the original parameters by Dale-Chall (1948), respectively.

This formula doesn’t need syllable count.

### Value

An object of class `kRp.readability`.
Examples

```r
## Not run:
dale.chall(tagged.text, word.list=new.dale.chall.wl)
## End(Not run)
```

---

**danielson.bryan**  
*Readability: Danielson-Bryan*

Description

This is just a convenient wrapper function for `readability`.

Usage

```r
danielson.bryan(
txt.file,
db1 = c(cpb = 1.0364, cps = 0.0194, const = 0.6059),
db2 = c(const = 131.059, cpb = 10.364, cps = 0.194),
...
)
```

Arguments

- **txt.file**  
  Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

- **db1**  
  A numeric vector with named magic numbers, defining the relevant parameters for the first formula (regression).

- **db2**  
  A numeric vector with named magic numbers, defining the relevant parameters for the second formula (cloze equivalent).

- **...**  
  Further valid options for the main function, see `readability` for details.

Details

Calculates the two Danielson-Bryan formulas. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

Value

An object of class `kRp.readability`.
Examples

## Not run:

danielson.bryan(tagged.text)

## End(Not run)

dickes.steiwer Readability: Dickes-Steiwer Handformel

Description

This is just a convenient wrapper function for `readability`.

Usage

```r
dickes.steiwer(
  txt.file,
  parameters = c(const = 235.95993, awl = 73.021, asl = 12.56438, ttr = 50.03293),
  case.sens = FALSE,
  ...
)
```

Arguments

- **txt.file**: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- **parameters**: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- **case.sens**: Logical, whether types should be counted case sensitive.
- **...**: Further valid options for the main function, see `readability` for details.

Details

This function calculates the shortcut formula by Dickes-Steiwer. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value. This formula doesn’t need syllable count.

Value

An object of class `kRp.readability`.

Examples

## Not run:

dickes.steiwer(tagged.text)

## End(Not run)
Generate a document-term matrix

Description

Returns a sparse document-term matrix calculated from a given TIF[1] compliant token data frame or object of class \texttt{kRp.text}. You can also calculate the term frequency inverted document frequency value (tf-idf) for each term.

Usage

\begin{verbatim}
docTermMatrix(obj, terms = "token", case.sens = FALSE, tfidf = FALSE, ...)

## S4 method for signature 'data.frame'
docTermMatrix(obj, terms = "token", case.sens = FALSE, tfidf = FALSE)

## S4 method for signature 'kRp.text'
docTermMatrix(obj, terms = "token", case.sens = FALSE, tfidf = FALSE)
\end{verbatim}

Arguments

- \texttt{obj}: Either an object of class \texttt{kRp.text}, or a TIF[1] compliant token data frame.
- \texttt{terms}: A character string defining the tokens column to be used for calculating the matrix.
- \texttt{case.sens}: Logical, whether terms should be counted case sensitive.
- \texttt{tfidf}: Logical, if \texttt{TRUE} calculates term frequency–inverse document frequency (tf-idf) values instead of absolute frequency.
- \ldots: Additional arguments depending on the particular method.

Details

This is usually more interesting if done with more than one single text. If you’re interested in full corpus analysis, the \texttt{tm.plugin.koRpus} package should be worth checking out. Alternatively, a data frame with multiple \texttt{doc_id} entries can be used.

See the examples to learn how to limit the analysis to desired word classes.

Value

A sparse matrix of class \texttt{dgCMatrix}.

References

**Examples**

```r
# code is only run when the English language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  # of course this makes more sense with a corpus of
  # multiple texts, see the tm.plugin.koRpus[2] package
  # for that
tenmobj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  # get the document-term frequencies in a sparse matrix
  myDTMatrix <- docTermMatrix(tenmobj)

  # combine with filterByClass() to, e.g., exclude all punctuation
  myDTMatrix <- docTermMatrix(filterByClass(tenmobj))

  # instead of absolute frequencies, get the tf-idf values
  myDTMatrix <- docTermMatrix(
    filterByClass(tenmobj),
    tfidf=TRUE
  )
} else {
}
```

---

**DRP**

*Readability: Degrees of Reading Power (DRP)*

**Description**

This is just a convenient wrapper function for `readability`.

**Usage**

`DRP(txt.file, word.list, ...)`

**Arguments**

- `txt.file` Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- `word.list` A vector or matrix (with exactly one column) which defines familiar words. For valid results the long Dale-Chall list with 3000 words should be used.
- `...` Further valid options for the main function, see `readability` for details.
Details

Calculates the Degrees of Reading Power, using the Bormuth Mean Cloze Score. In contrast to \texttt{readability}, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

Value

An object of class \texttt{kRp.readability}.

Examples

```r
## Not run:
DRP(tagged.text, word.list=new.dale.chall.wl)
## End(Not run)
```

\section*{Description}

This is just a convenient wrapper function for \texttt{readability}.

\section*{Usage}

\texttt{ELF(txt.file, hyphen = NULL, parameters = c(syll = 1), ...)}

\section*{Arguments}

\begin{itemize}
  \item \texttt{txt.file} Either an object of class \texttt{kRp.text}, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by \texttt{readability.num}.
  \item \texttt{hyphen} An object of class \texttt{kRp.hyphen}. If \texttt{NULL}, the text will be hyphenated automatically.
  \item \texttt{parameters} A numeric vector with named magic numbers, defining the relevant parameters for the index.
  \item \texttt{...} Further valid options for the main function, see \texttt{readability} for details.
\end{itemize}

\section*{Details}

This function calculates Fang’s Easy Listening Formula (ELF). In contrast to \texttt{readability}, which by default calculates all possible indices, this function will only calculate the index value.

\section*{Value}

An object of class \texttt{kRp.readability}.  

**farr.jenkins.paterson**  

**References**

**Examples**

```r
## Not run:
ELF(tagged.text)

## End(Not run)
```

---

### farr.jenkins.paterson  *Readability: Farr-Jenkins-Paterson Index*

**Description**

This is just a convenient wrapper function for *readability*.

**Usage**

```r
farr.jenkins.paterson(
  txt.file,  
  hyphen = NULL, 
  parameters = c(const = -31.517, asl = 1.015, monsy = 1.599), 
  ... 
)
```

**Arguments**

- **txt.file**  
  Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by *readability.num*.

- **hyphen**  
  An object of class kRp.hyphen. If NULL, the text will be hyphenated automatically.

- **parameters**  
  A numeric vector with named magic numbers, defining the relevant parameters for the index, or "PSK".

- **...**  
  Further valid options for the main function, see *readability* for details.

**Details**

Calculates the Farr-Jenkins-Paterson index, a simplified version of Flesch Reading Ease. In contrast to *readability*, which by default calculates all possible indices, this function will only calculate the index value.

If parameters="PSK", the revised parameters by Powers-Sumner-Kearl (1958) are used.
Value

An object of class \texttt{kRp.readability}.

References

See Also

\texttt{flesch}

Examples

```r
## Not run:
farr.jenkins.paterson(tagged.text)
## End(Not run)
```

---

**filterByClass**

Remove word classes

Description

This method strips off defined word classes of tagged text objects.

Usage

```r
filterByClass(txt, ...)
```

```r
## S4 method for signature 'kRp.text'
filterByClass(
  txt,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c(),
  as.vector = FALSE,
  update.desc = TRUE
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txt</td>
<td>An object of class \texttt{kRp.text}.</td>
</tr>
<tr>
<td>...</td>
<td>Additional options, currently unused.</td>
</tr>
</tbody>
</table>
corp.rm.class   A character vector with word classes which should be removed. The default value "nonpunct" has special meaning and will cause the result of kRp.POS.tags(lang, tags=c("punct","sentc"), list.classes=TRUE) to be used. Another valid value is "stopword" to remove all detected stopwords.

corp.rm.tag     A character vector with valid POS tags which should be removed.

as.vector       Logical. If TRUE, results will be returned as a character vector containing only the text parts which survived the filtering.

update.desc     Logical. If TRUE, the desc slot of the tagged object will be fully recalculated using the filtered text. If FALSE, the desc slot will be copied from the original object. Finally, if NULL, the desc slot remains empty.

Value

An object of the input class. If as.vector=TRUE, returns only a character vector.

See Also

kRp.POS.tags

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  filterByClass(tokenized.obj)
} else {}
Arguments

txt.file Either an object of class kRp.text, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.

hyphen An object of class kRp.hyphen. If NULL, the text will be hyphenated automatically.

parameters Either a numeric vector with named magic numbers, defining the relevant parameters for the index, or a valid character string naming a preset for implemented languages ("de", "es", "es-s", "nl", "nl-b", "fr").

... Further valid options for the main function, see readability for details.

Details
Calculates the Flesch Readability Ease index. In contrast to readability, which by default calculates all possible indices, this function will only calculate the Flesch RE value.

Certain internationalisations of the parameters are also implemented. They can be used by setting parameters to "es" (Fernandez-Huerta), "es-s" (Szigriszt), "nl" (Douma), "nl-b" (Brouwer), "de" (Amstad) or "fr" (Kandel-Moles). If parameters="PSK", the revised parameters by Powers-Sumner-Kearl (1958) are used to calculate a grade level.

Value
An object of class kRp.readability.

See Also
flesch.kincaid for grade levels, farr.jenkins.paterson for a simplified Flesch formula.

Examples
## Not run:
flesch(german.tagged.text, parameters="de")

## End(Not run)
Usage

flesch.kincaid(
    txt.file,
    hyphen = NULL,
    parameters = c(asl = 0.39, asw = 11.8, const = 15.59),
    ...
)

Arguments

- **txt.file**: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- **hyphen**: An object of class `kRp.hyphen`. If `NULL`, the text will be hyphenated automatically.
- **parameters**: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- **...**: Further valid options for the main function, see `readability` for details.

Details

Calculates the Flesch-Kincaid grade level. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

Value

An object of class `kRp.readability`.

Examples

```r
## Not run:
flesch.kincaid(tagged.text)
## End(Not run)
```

Description

This is just a convenient wrapper function for `readability`. 

---

Readability: Gunning FOG Index

---
Usage

```r
FOG(
  txt.file,
  hyphen = NULL,
  parameters = list(syll = 3, const = 0.4, suffix = c("es", "ed", "ing")),
  ...
)
```

Arguments

txt.file Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

hyphen An object of class `kRp.hyphen`. If `NULL`, the text will be hyphenated automatically.

parameters A list with named magic numbers and a vector with verb suffixes, defining the relevant parameters for the index, or one of "PSK" or "NRI".

... Further valid options for the main function, see `readability` for details.

Details

Calculates the Gunning FOG index. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

If `parameters="PSK"`, the revised parameters by Powers-Sumner-Kearl (1958) are used, and if `parameters="NRI"`, the simplified parameters from the Navy Readability Indexes, respectively.

Value

An object of class `kRp.readability`.

References

Examples

```r
## Not run:
FOG(tagged.text)
## End(Not run)```
Description

This is just a convenient wrapper function for `readability`.

Usage

```
FORCAST(
  txt.file,
  hyphen = NULL,
  parameters = c(syll = 1, mult = 0.1, const = 20),
  ...
)
```

Arguments

- `txt.file`: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- `hyphen`: An object of class `kRp.hyphen`. If `NULL`, the text will be hyphenated automatically.
- `parameters`: A numeric vector with named magic numbers, defining the relevant parameters for the index, or "RGL".
- `...`: Further valid options for the main function, see `readability` for details.

Details

Calculates the FORCAST index (both grade level and reading age). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value. If `parameters="RGL"`, the parameters for the precise Reading Grade Level are used.

Value

An object of class `kRp.readability`.

References

Examples

```
## Not run:
FORCAST(tagged.text)

## End(Not run)
```
freq.analysis

Analyze word frequencies

Description

The function freq.analysis analyzes texts regarding frequencies of tokens, word classes etc.

Usage

freq.analysis(txt.file, ...)

## S4 method for signature 'kRp.text'
freq.analysis(
  txt.file,
  corp.freq = NULL,
  desc.stat = TRUE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c()
)

Arguments

- **txt.file** An object of class kRp.text.
- **...** Additional options for the generic.
- **corp.freq** An object of class kRp.corp.freq.
- **desc.stat** Logical, whether an updated descriptive statistical analysis should be conducted.
- **corp.rm.class** A character vector with word classes which should be ignored for frequency analysis. The default value "nonpunct" has special meaning and will cause the result of kRp.POS.tags(lang, tags=c("punct","sentc"), list.classes=TRUE) to be used.
- **corp.rm.tag** A character vector with POS tags which should be ignored for frequency analysis.

Details

It adds new columns with frequency information to the tokens data frame of the input data, describing how often the particular token is used in the additionally provided corpus frequency object.

To get the results, you can use taggedText to get the tokens slot, describe to get the raw descriptive statistics (only updated if desc.stat=TRUE), and corpusFreq to get the data from the added freq feature.

If corp.freq provides appropriate idf values for the types in txt.file, the term frequency–inverse document frequency statistic (tf-idf) will also be computed. Missing idf values will result in NA.
**Value**

An updated object of class \texttt{kRp.text} with the added feature \texttt{freq}, which is a list with information on the word frequencies of the analyzed text. Use \texttt{corpusFreq} to get that slot.

**See Also**

\texttt{get.kRp.env}, \texttt{kRp.text}, \texttt{kRp.corp.freq}

**Examples**

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt")
  # call freq.analysis() on a tokenized text
tokenized.obj <- tokenize(txt=sample_file, lang="en")
  # the token slot before frequency analysis
  head(taggedText(tokenized.obj))

  # instead of data from a larger corpus, we'll use the token frequencies of the text itself
  tokenized.obj <- freq.analysis(tokenized.obj, corp.freq=read.corp.custom(tokenized.obj))
  # compare the columns after the analysis
  head(taggedText(tokenized.obj))

  # the object now has further statistics in a new feature slot called freq
  hasFeature(tokenized.obj)
corpusFreq(tokenized.obj)
} else {}  
```

---

**fucks**

**Readability: Fucks' Stilcharakteristik**

**Description**

This is just a convenient wrapper function for \texttt{readability}.

**Usage**

\texttt{fucks(txt.file, ...)}
Arguments

- **txt.file**: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

... Further valid options for the main function, see `readability` for details.

Details

Calculates Fucks' Stilcharakteristik ("characteristics of style"; Fucks, 1955, as cited in Briest, 1974). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

Value

An object of class `kRp.readability`.

References

Examples

```r
## Not run:
fucks(tagged.text)
## End(Not run)
```

Description

The function `get.kRp.env` returns information on your session environment regarding the koRpus package, e.g., where your local TreeTagger installation resides, if it was set before using `set.kRp.env`.

Usage

```r
get.kRp.env(..., errorIfUnset = TRUE)
```
guess.lang

Arguments

... Named parameters to get from the koRpus environment. Valid arguments are:

TT.cmd Logical, whether the set tagger command should be returned.
lang Logical, whether the set language should be returned.
TT.options Logical, whether the set TT.options for treetag should be returned.
hyph.cache.file Logical, whether the set hyphenation cache file for hyphen should be returned.
add.desc Logical, whether tag descriptions should be added directly to tagged text objects.
errorIfUnset Logical, if TRUE and the desired property is not set at all, the function will fail with an error message.

Details

For the most part, get.kRpus.env is a convenient wrapper for getOption.

Value

A character string or list, possibly including:

TT.cmd Path information for the TreeTagger command
lang The specified language
TT.options A list with options for treetag
hyph.cache.file The specified hyphenation cache file for hyphen

See Also

set.kRpus.env

Examples

set.kRpus.env(lang="en")
get.kRpus.env(lang=TRUE)

---

guess.lang \textit{Guess language a text is written in}

Description

This function tries to guess the language a text is written in.
Usage

guess.lang(
  txt.file,
  udhr.path,
  comp.length = 300,
  keep.udhr = FALSE,
  quiet = TRUE,
  in.mem = TRUE,
  format = "file"
)

Arguments

txt.file  A character vector pointing to the file with the text to be analyzed.
udhr.path A character string, either pointing to the directory where you unzipped the transla-
tations of the Universal Declaration of Human Rights, or to the ZIP file containing them.
comp.length Numeric value, giving the number of characters to be used of txt to estimate
        the language.
keep.udhr Logical, whether all the UDHR translations should be kept in the resulting ob-
        ject.
quiet Logical. If FALSE, short status messages will be shown.
in.mem Logical. If TRUE, the gzip compression will remain in memory (using memCompress),
        which is probably the faster method. Otherwise temporary files are created and
        automatically removed on exit.
format Either "file" or "obj". If the latter, txt.file is not interpreted as a file path but
        the text to analyze itself.

Details

To accomplish the task, the method described by Benedetto, Caglioti & Loreto (2002) is used,
utilizing both gzip compression and translations of the Universal Declaration of Human Rights[1].
The latter holds the world record for being translated into the most different languages, and is
publicly available.

Value

An object of class knp.lang.

Note

For this implementation the documents provided by the "UDHR in Unicode" project[2] have been
used. Their translations are not part of this package and must be downloaded separately to use
guess.lang! You need the ZIP archive containing all the plain text files from https://unicode.
org/udhr/downloads.html.
References

Examples

```r
## Not run:
# using the still zipped bulk file
guess.lang(
  file.path("~","data","some.txt"),
  udhr.path=file.path("~","data","udhr_txt.zip")
)
# using the unzipped UDHR archive
guess.lang(
  file.path("~","data","some.txt"),
  udhr.path=file.path("~","data","udhr_txt")
)
## End(Not run)
```

---

**gutierrez**

*Readability: Gutiérrez Fórmula de comprensibilidad*

Description

This is just a convenient wrapper function for *readability*.

Usage

```
gutierrez(txt.file, ...)
```

Arguments

- **txt.file**
  - Either an object of class `kRp.text`, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

- **...**
  - Further valid options for the main function, see `readability` for details.

Details

Calculates Gutiérrez de Polini’s *Fórmula de comprensibilidad* (Gutiérrez, 1972, as cited in Fernández, 2016). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.
Value

An object of class \texttt{kRp.readability}.

References

Examples

```r
## Not run:
gutierrez(tagged.text)
## End(Not run)
```

---

\texttt{harris.jacobson} \hspace{1cm} \textit{Readability: Harris-Jacobson indices}

Description

This is just a convenient wrapper function for \texttt{readability}.

Usage

\begin{verbatim}
\texttt{harris.jacobson(}
\text{txt.file,}
\text{word.list,}
\text{parameters = c(char = 6),}
\text{hj1 = c(dword = 0.094, asl = 0.168, const = 0.502),}
\text{hj2 = c(dword = 0.14, asl = 0.153, const = 0.56),}
\text{hj3 = c(asl = 0.158, lword = 0.055, const = 0.355),}
\text{hj4 = c(dword = 0.07, asl = 0.125, lword = 0.037, const = 0.497),}
\text{hj5 = c(dword = 0.118, asl = 0.134, lword = 0.032, const = 0.424),}
\text{...}
\text{)}
\end{verbatim}

Arguments

\begin{itemize}
\item \texttt{txt.file} \hspace{1cm} Either an object of class \texttt{kRp.text}, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by \texttt{readability.num}.
\item \texttt{word.list} \hspace{1cm} A vector or matrix (with exactly one column) which defines familiar words. For valid results the short Harris-Jacobson word list for grades 1 and 2 (english) should be used.
\item \texttt{parameters} \hspace{1cm} A numeric vector with named magic numbers, defining the relevant parameters for all formulas of the index.
\end{itemize}
**HDD**

A numeric vector with named magic numbers for the first of the formulas.

A numeric vector with named magic numbers for the second of the formulas.

A numeric vector with named magic numbers for the third of the formulas.

A numeric vector with named magic numbers for the fourth of the formulas.

A numeric vector with named magic numbers for the fifth of the formulas.

Further valid options for the main function, see `readability` for details.

**Details**

This function calculates the revised Harris-Jacobson readability formulas (1 to 5), as described in their paper for the 18th Annual Meeting of the College Reading Association (Harris & Jacobson, 1974). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index values.

This formula doesn’t need syllable count.

**Value**

An object of class `kRp.readability`.

**References**

**Examples**

```r
## Not run:
harris.jacobson(tagged.text, word.list=harris.jacobson.wl)
## End(Not run)
```

---

**HDD**

*Lexical diversity: HD-D (vocd-d)*

**Description**

This is just a convenient wrapper function for `lex.div`.

**Usage**

`HDD(txt, rand.sample = 42, char = FALSE, ...)`
Arguments

- `txt` An object of class `kRp.text` containing the tagged text to be analyzed.
- `rand.sample` An integer value, how many tokens should be assumed to be drawn for calculating HD-D.
- `char` Logical, defining whether data for plotting characteristic curves should be calculated.
- `...` Further valid options for the main function, see `lex.div` for details.

Details

This function calculates HD-D, an idealized version of vocd-d (see McCarthy & Jarvis, 2007). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the HD-D value, and characteristics are off by default.

Value

An object of class `kRp.TTR`.

References

See Also

`kRp.POS.tags`, `kRp.text`, `kRp.TTR`

Examples

```r
## Not run:
HDD(tagged.text)
## End(Not run)
```

Description

These methods implement word hyphenation, based on Liang’s algorithm. For details, please refer to the documentation for the generic `hyphen` method in the `syll` package.
Usage

```r
## S4 method for signature 'kRp.text'
hyphen(
  words,
  hyph.pattern = NULL,
  min.length = 4,
  rm.hyph = TRUE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c(),
  quiet = FALSE,
  cache = TRUE,
  as = "kRp.hyphen",
  as.feature = FALSE
)
```

```r
## S4 method for signature 'kRp.text'
hyphen_df(
  words,
  hyph.pattern = NULL,
  min.length = 4,
  rm.hyph = TRUE,
  quiet = FALSE,
  cache = TRUE
)
```

```r
## S4 method for signature 'kRp.text'
hyphen_c(
  words,
  hyph.pattern = NULL,
  min.length = 4,
  rm.hyph = TRUE,
  quiet = FALSE,
  cache = TRUE
)
```

Arguments

- **words**: Either an object of class `kRp.text`, or a character vector with words to be hyphenated.
- **hyph.pattern**: Either an object of class `kRp.hyph.pat`, or a valid character string naming the language of the patterns to be used. See details.
- **min.length**: Integer, number of letters a word must have for considering a hyphenation. `hyphen` will not split words after the first or before the last letter, so values smaller than 4 are not useful.
- **rm.hyph**: Logical, whether appearing hyphens in words should be removed before pattern matching.
corp.rm.class A character vector with word classes which should be ignored. The default value "nonpunct" has special meaning and will cause the result of kRp.POS.tags(lang, tags=c("punct","sentc"), list.classes=TRUE) to be used. Relevant only if words is a valid koRpus object.

corp.rm.tag A character vector with POS tags which should be ignored. Relevant only if words is a valid koRpus object.

quiet Logical. If FALSE, short status messages will be shown.

cache Logical. If TRUE, the current cache will be queried and new tokens also be added. Caches are language-specific and reside in an environment, i.e., they are cleaned at the end of a session. If you want to save these for later use, see the option hyph.cache.file in set.kRp.env.

as A character string defining the class of the object to be returned. Defaults to "kRp.hyphen", but can also be set to "data.frame" or "numeric", returning only the central data.frame or the numeric vector of counted syllables, respectively. For the latter two options, you can alternatively use the shortcut methods hyphen_df or hyphen_c. Ignored if as.feature=TRUE.

as.feature Logical, whether the output should be just the analysis results or the input object with the results added as a feature. Use corpusHyphen to get the results from such an aggregated object. If set to TRUE, as="kRp.hyphen" is automatically set, overwriting other setting of as with a warning.

Value

An object of class kRp.text, kRp.hyphen, data.frame or a numeric vector, depending on the values of the as and as.feature arguments.

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  # call hyphen on a given english word
  # "quiet=TRUE" suppresses the progress bar
  hyphen(

}
install.koRpus.lang

"interference",
    hyph.pattern="en",
    quiet=TRUE
)

# call hyphen() on a tokenized text
tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
)

# language definition is defined in the object
# if you call hyphen() without arguments,
# you will get its results directly
hyphen(tokenized.obj)

# alternatively, you can also store those results as a
# feature in the object itself
tokenized.obj <- hyphen(
    tokenized.obj,
    as.feature=TRUE
)

# results are now part of the object
hasFeature(tokenized.obj)
corpusHyphen(tokenized.obj)
) else {}

install.koRpus.lang  Install language support packages

Description

This is a wrapper for install.packages, making it more convenient to install additional language support packages for koRpus.

Usage

install.koRpus.lang(
    lang,
    repos = "https://undocumeantit.github.io/repos/l10n/",
    ...
)

Arguments

lang          Character vector, one or more valid language identifiers (like en for English or de for German).
repos         The URL to additional repositories to query. You should probably leave this to the default, but if you would like to use a third party repository, you’re free to do so. The value is temporarily appended to the repos currently returned bygetOption("repos").
jumbleWords

... Additional options for install.packages.

Details

For a list of currently available language packages see available.koRpus.lang. See set.lang.support for more details on koRpus' language support in general.

Value

Does not return any useful objects, just calls install.packages.

See Also

install.packages, available.koRpus.lang

Examples

## Not run:
# install support for German
install.koRpus.lang("de")
# load the package
library("koRpus.lang.de")

## End(Not run)

jumbleWords

Produce jumbled words

Description

This method either takes a character vector or objects inheriting class kRp.text (i.e., text tokenized by koRpus), and jumbles the words. This usually means that the first and last letter of each word is left intact, while all characters inbetween are being randomized.

Usage

jumbleWords(words, ...)

## S4 method for signature 'kRp.text'
jumbleWords(words, min.length = 3, intact = c(start = 1, end = 1))

## S4 method for signature 'character'
jumbleWords(words, min.length = 3, intact = c(start = 1, end = 1))
Arguments

words
Either a character vector or an object inheriting from class \texttt{kRp.text}.

\ldots
Additional options, currently unused.

min.length
An integer value, defining the minimum word length. Words with less characters will not be changed. Grapheme clusters are counted as one.

intact
A named vector with the two integer values named \texttt{start} and \texttt{stop}. These define how many characters of each relevant words will be left unchanged at its start and its end, respectively.

Value

Depending on the class of \texttt{words}, either a character vector or an object of class \texttt{kRp.text} with the added feature \texttt{diff}.

Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file &lt; file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj &lt;- tokenize(
    txt=sample_file,
    lang="en"
  )
  tokenized.obj &lt;- jumbleWords(tokenized.obj)
  pasteText(tokenized.obj)
  # diff stats are now part of the object
  hasFeature(tokenized.obj)
  diffText(tokenized.obj)
} else {} 
```

---

\textit{K.\textit{ld}} \textit{Lexical diversity: Yule’s K}

Description

This is just a convenient wrapper function for \texttt{lex.div}.

Usage

\texttt{K.\textit{ld}(txt, char = FALSE, \ldots)}
Arguments

txt  An object of class kRp.text containing the tagged text to be analyzed.

char Logical, defining whether data for plotting characteristic curves should be calculated.

... Further valid options for the main function, see lex.div for details.

Details

This function calculates Yule’s K. In contrast to lex.div, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the K value, and characteristics are off by default.

Value

An object of class kRp.TTR.

See Also

kRp.POS.tags, kRp.text, kRp.TTR

Examples

## Not run:
K.ld(tagged.text)

## End(Not run)

---

koRpus-deprecated  Deprecated object classes

Description

These classes are no longer used by the koRpus package and will be removed in a later version. They are kept here for the time being so you can still load old objects and convert them into new objects using the fixObject method.

These functions will be removed soon and should no longer be used.

Usage

kRp.filter.wclass(...)

kRp.text.paste(...)

read.tagged(...)

kRp.text.transform(...)

Arguments

... Parameters to be passed to the replacement of the function

Slots

lang A character string, naming the language that is assumed for the tokenized text in this object.
desc Descriptive statistics of the tagged text.
TT.res Results of the called tokenizer and POS tagger. The data.frame usually has eleven columns:
doc_id: Factor, optional document identifier.
token: Character, the tokenized text.
tag: Factor, POS tags for each token.
lemma: Character, lemma for each token.
lttr: Integer, number of letters.
wclass: Factor, word class.
desc: Factor, a short description of the POS tag.
stop: Logical, TRUE if token is a stopword.
stem: Character, stemmed token.
idx: Integer, index number of token in this document.
sntc: Integer, number of sentence in this document.

This data.frame structure adheres to the "Text Interchange Formats" guidelines set out by rOpenSci[1].

freq.analysis A list with information on the word frequencies of the analyzed text.
diff A list with mostly atomic vectors, describing the amount of differences between both text variants (percentage):
all.tokens: Percentage of all tokens, including punctuation, that were altered.
words: Percentage of altered words only.
al chars: Percentage of all characters, including punctuation, that were altered.
letters: Percentage of altered letters in words only.
transfmt: Character vector documenting the transformation(s) done to the tokens.
transfmt.equal: Data frame documenting which token was changed in which transformational step. Only available if more than one transformation was done.
transfmt.normalize: A list documenting steps of normalization that were done to the object, one element per transformation. Each entry holds the name of the method, the query parameters, and the effective replacement value.

lex.div Information on lexical diversity

S4 Class kR p.tagged

This was used for objects returned by treetag or tokenize. It was replaced by kR.p.text.

S4 Class kR.p.txt.freq

This was used for objects returned by freq.analysis. It was replaced by kR.p.text.
### S4 Class kRp.txt.trans

This was used for objects returned by `textTransform`, `clozeDelete`, `cTest`, and `jumbleWords`. It was replaced by `kRp.text`.

### S4 Class kRp.analysis

This was used for objects returned by `kRp.text.analysis`. The function is also deprecated, functionality can be replicated by combining `treetag`, `freq.analysis` and `lex.div`.

### References

---

**kRp.cluster**

Work in (early) progress. Probably don’t even look at it. Consider it pure magic that is not to be tempered with.

### Description

In some future release, this might evolve into a function to help comparing several texts by features like average sentence length, word length, lexical diversity, and so forth. The idea behind it is to conduct a cluster analysis, to discover which texts out of several are similar to (or very different from) each other. This can be useful, e.g., if you need texts for an experiment which are different in content, but similar regarding syntactic features, like listed above.

### Usage

```r
kRp.cluster(txts, lang, TT.path, TT.preset)
```

### Arguments

- `txts` A character vector with paths to texts to analyze.
- `lang` A character string with a valid Language identifier.
- `TT.path` A character string, path to TreeTagger installation.
- `TT.preset` A character string naming the TreeTagger preset to use.

### Details

It is included in this package not really to be used, but to maybe inspire you, to toy around with the code and help me to come up with something useful in the end...
Description

This class is used for objects that are returned by `read.corp.LCC` and `read.corp.celex`.

Details

The slot `meta` simply contains all information from the "meta.txt" of the LCC[1] data and remains empty for data from a Celex[2] DB.

Slots

- **meta**: Metadata on the corpora (see details).
- **words**: Absolute word frequencies. It has at least the following columns:
  - `num`: Some word ID from the DB, integer
  - `word`: The word itself
  - `lemma`: The lemma of the word
  - `tag`: A part-of-speech tag
  - `wclass`: The word class
  - `lttr`: The number of characters
  - `freq`: The frequency of that word in the corpus DB
  - `pct`: Percentage of appearance in DB
  - `pmio`: Appearance per million words in DB
  - `log10`: Base 10 logarithm of word frequency
  - `rank.avg`: Rank in corpus data, `rank` ties method "average"
  - `rank.min`: Rank in corpus data, `rank` ties method "min"
  - `rank.rel.avg`: Relative rank, i.e. percentile of "rank.avg"
  - `rank.rel.min`: Relative rank, i.e. percentile of "rank.min"
  - `inDocs`: The absolute number of documents in the corpus containing the word
  - `idf`: The inverse document frequency

The slot might have additional columns, depending on the input material.

- **desc**: Descriptive information. It contains six numbers from the `meta` information, for convenient accessibility:
  - `tokens`: Number of running word forms
  - `types`: Number of distinct word forms
  - `words.p.sntc`: Average sentence length in words
  - `chars.p.sntc`: Average sentence length in characters
  - `chars.p.wform`: Average word form length
  - `chars.p.word`: Average running word length

The slot might have additional columns, depending on the input material.
bigrams A data.frame listing all tokens that co-occurred next to each other in the corpus:
  token1: The first token
  token2: The second token that appeared right next to the first
  freq: How often the co-occurrence was present
  sig: Log-likelihood significance of the co-occurrence

cocoocur Similar to bigrams, but listing co-occurrences anywhere in one sentence:
  token1: The first token
  token2: The second token that appeared in the same sentence
  freq: How often the co-occurrence was present
  sig: Log-likelihood significance of the co-occurrence

caseSens A single logical value, whether the frequency statistics were calculated case sensitive or not.

Constructor function

Should you need to manually generate objects of this class (which should rarely be the case), the constructor function kRp_corp_freq(...) can be used instead of new("kRp.corp.freq", ...).

References

kRp.lang,-class S4 Class kRp.lang

Description

This class is used for objects that are returned by guess.lang.

Slots

lang A character string, naming the language (by its ISO 639-3 identifier) that was estimated for the analyzed text in this object.
lang.name A character string, full name of the estimated language.
txt A character string containing the analyzed part of the text.
txt.full A character string containing the full text.
udhr A data.frame with full analysis results for each language tried.

Constructor function

Should you need to manually generate objects of this class (which should rarely be the case), the constructor function kRp_lang(...) can be used instead of new("kRp.lang", ...).
kRp.POS.tags  Get elaborated word tag definitions

Description

This function can be used to get a set of part-of-speech (POS) tags for a given language. These tag sets should conform with the ones used by TreeTagger.

Usage

kRp.POS.tags(
  lang = get.kRp.env(lang = TRUE),
  list.classes = FALSE,
  list.tags = FALSE,
  tags = c("words", "punct", "sentc")
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lang</td>
<td>A character string defining a language (see details for valid choices).</td>
</tr>
<tr>
<td>list.classes</td>
<td>Logical, if TRUE only the known word classes for the chosen language will me returned.</td>
</tr>
<tr>
<td>list.tags</td>
<td>Logical, if TRUE only the POS tags for the chosen language will me returned.</td>
</tr>
<tr>
<td>tags</td>
<td>A character vector with at least one of &quot;words&quot;, &quot;punct&quot; or &quot;sentc&quot;.</td>
</tr>
</tbody>
</table>

Details

Use `available.koRpus.lang` to get a list of all supported languages. Language support packages must be installed and loaded to be usable with kRp.POS.tags. For the internal tokenizer a small subset of tags is also defined, available through `lang="kRp"`. Finally, the Universal POS Tags[1] are automatically appended if no matching tag was already defined. If you don’t know the language your text was written in, the function `guess.lang` should be able to detect it.

With the element `tags` you can specify if you want all tag definitions, or a subset, e.g. tags only for punctuation and sentence endings (that is, you need to call for both "punct" and "sentc" to get all punctuation tags).

The function is not so much intended to be used directly, but it is called by several other functions internally. However, it can still be useful to directly examine available POS tags.

Value

If `list.classes=FALSE` and `list.tags=FALSE` returns a matrix with word tag definitions of the given language. The matrix has three columns:

<table>
<thead>
<tr>
<th>tag name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>Word tag</td>
</tr>
<tr>
<td>class</td>
<td>Respective word class</td>
</tr>
<tr>
<td>desc</td>
<td>&quot;Human readable&quot; description of what the tag stands for</td>
</tr>
</tbody>
</table>
Otherwise a vector with the known word classes or POS tags for the chosen language (and probably tag subset) will be returned. If both list.classes and list.tags are TRUE, still only the POS tags will be returned.

Tuldava The calculated value of the Tuldava text difficulty formula. NA if not calculated.
Wheeler.Smith The "flavour" of the parameter settings and the calculated value of the Wheeler-Smith index. NA if not calculated.
Wiener.STF The "flavour" of the parameter settings and the calculated value of the Wiener Sachtextformel. NA if not calculated.

Constructor function

Should you need to manually generate objects of this class (which should rarely be the case), the constructor function kRp_readability(...) can be used instead of new("kRp.readability", ...).

kRp.text,-class  S4 Class kRp.text

Description

This class is used for objects that are returned by treetag or tokenize.

Slots

lang A character string, naming the language that is assumed for the tokenized text in this object.
desc Descriptive statistics of the tagged text.
tokens Results of the called tokenizer and POS tagger. The data.frame usually has eleven columns:
doc_id: Factor, optional document identifier.
token: Character, the tokenized text.
tag: Factor, POS tags for each token.
lemma: Character, lemma for each token.
lttr: Integer, number of letters.
wclass: Factor, word class.
desc: Factor, a short description of the POS tag.
stop: Logical, TRUE if token is a stopword.
stem: Character, stemmed token.
idx: Integer, index number of token in this document.
sntc: Integer, number of sentence in this document.

This data.frame structure adheres to the "Text Interchange Formats" guidelines set out by rOpenSci[1].

features A named logical vector, indicating which features are available in this object's feat_list slot. Common features are listed in the description of the feat_list slot.

feat_list A named list with optional analysis results or other content as used by the defined features:

• hyphen A named list of objects of class kRp.hyphen.
• readability A named list of objects of class kRp.readability.
• lex_div A named list of objects of class kRp.TTR.
• freq A list with additional results of freq.analysis.
• corp_freq An object of class kRp.corp.freq, e.g., results of a call to read.corp.custom.
• diff Additional results of calls to a method like textTransform.
• doc_term_matrix A sparse document-term matrix, as produced by docTermMatrix.

See the getter and setter methods for easy access to these sub-slots. There can actually be any number of additional features, the above is just a list of those already defined by this package.

Constructor function

Should you need to manually generate objects of this class (which should rarely be the case), the constructor function kRp_text(...) can be used instead of new("kRp.text", ...).

Note

There is also as() methods to transform objects from other koRpus classes into kRp.text.

References

**Description**

This class is used for objects that are returned by `lex.div` and its wrapper functions (like TTR, MSTTR, MTLD, etc.).

**Slots**

param Relevant parameters of the given analysis, as given to the function call, see `lex.div` for details.

tt The analyzed text in tokenized form, with eight elements ("tokens", "types", "lemmas", "type.in.txt", "type.in.result", "num.tokens", "num.types", "num.lemmas").

TTR Value of the classic type-token ratio. NA if not calculated.

MSTTR Mean segmental type-token ratio, including the actual "MSTTR", TTR values of each segment ("TTR.seg"), and the number of dropped words due to segment size ("dropped"). NA if not calculated.

MATTR Moving-average type-token ratio, including the actual "MATTR", TTR values of each window ("TTR.win"), and standard deviation of TTRs ("sd"). NA if not calculated.

C.ld Herdan’s C. NA if not calculated.

R. ld Guiraud’s R. NA if not calculated.

CTTR Carroll’s CTTR. NA if not calculated.

U. ld Uber Index. NA if not calculated.

S. ld Summer’s S. NA if not calculated.

K. ld Yule’s K. NA if not calculated.

Maas Maas’ a. NA if not calculated.

lgV0 Maas’ \( \lg V_0 \). NA if not calculated.

lgeV0 Maas’ \( \lg e V_0 \). NA if not calculated.

Maas.grw Maas’ relative type growth \( V' \). NA if not calculated.

HDD The actual HD-D value ("HDD"), a vector with the probabilities for each type ("type.probs"), a "summary" on these probabilities and their standard deviation "sd".

MTLD Measure of textual lexical diversity, including the actual "MTLD", two matrices with detailed information on forward and backward factorization ("all.forw" & "all.back"), a named vector holding both calculated factors values ("factors"), and a named list with information on the number or tokens in each factor, both forward and backward, as well as their mean and standard deviation ("lengths"). NA if not calculated.

MTLDMMA Moving-average MTLD, including the actual "MTLDMMA", its standard deviation, a list ("all") with detailed information on factorization, the step size, and a named list with information on the number or tokens in each factor, as well as their mean and standard deviation ("lengths"). NA if not calculated.
TTR.char  TTR values, starting with the first steplength of tokens, then adding the next one, progressing until the whole text is analyzed. The matrix has two columns, one for the respective step ("token") and one for the actual values ("value"). Can be used to plot TTR characteristic curves. NA if not calculated.

MATTR.char  Equivalent to TTR.char, but calculated using MATTR algorithm. NA if not calculated.

C.char  Equivalent to TTR.char, but calculated using Herdan's C algorithm. NA if not calculated.

R.char  Equivalent to TTR.char, but calculated using Guiraud's R algorithm. NA if not calculated.

CTTR.char  Equivalent to TTR.char, but calculated using Carroll's CTTR algorithm. NA if not calculated.

U.char  Equivalent to TTR.char, but calculated using the Uber Index algorithm. NA if not calculated.

S.char  Equivalent to TTR.char, but calculated using Summer's S algorithm. NA if not calculated.

K.char  Equivalent to TTR.char, but calculated using Yule's K algorithm. NA if not calculated.

Maas.char  Equivalent to TTR.char, but calculated using Maas' a algorithm. NA if not calculated.

lgV0.char  Equivalent to TTR.char, but calculated using Maas' \( \log V_0 \) algorithm. NA if not calculated.

lgeV0.char  Equivalent to TTR.char, but calculated using Maas' \( \log e V_0 \) algorithm. NA if not calculated.

HDD.char  Equivalent to TTR.char, but calculated using the HD-D algorithm. NA if not calculated.

MTLD.char  Equivalent to TTR.char, but calculated using the MTLD algorithm. NA if not calculated.

MTLDMA.char  Equivalent to TTR.char, but calculated using the moving-average MTLD algorithm. NA if not calculated.

**Constructor function**

Should you need to manually generate objects of this class (which should rarely be the case), the constructor function `kRp_TTR(...)` can be used instead of `new("kRp.TTR", ...)`.

---

**lex.div**  
*Analyze lexical diversity*

**Description**

These methods analyze the lexical diversity/complexity of a text corpus.

**Usage**

```r
lex.div(txt, ...)
```

```r
## S4 method for signature 'kRp.text'
lex.div(
  txt,
```
segment = 100,
factor.size = 0.72,
min.tokens = 9,
MTLDMA.steps = 1,
rand.sample = 42,
window = 100,
case.sens = FALSE,
lemmatize = FALSE,
detailed = FALSE,
          "MTLD", "MTLD-MA"),
        "MTLD-MA"),
char.steps = 5,
log.base = 10,
force.lang = NULL,
keep.tokens = FALSE,
type.index = FALSE,
corp.rm.class = "nonpunct",
corp.rm.tag = c(),
as.feature = FALSE,
quiet = FALSE)

## S4 method for signature 'character'
lex.div(
  txt,
  segment = 100,
  factor.size = 0.72,
  min.tokens = 9,
  MTLDMA.steps = 1,
  rand.sample = 42,
  window = 100,
case.sens = FALSE,
lemmatize = FALSE,
detailed = FALSE,
          "MTLD", "MTLD-MA"),
        "MTLD-MA"),
char.steps = 5,
log.base = 10,
force.lang = NULL,
keep.tokens = FALSE,
type.index = FALSE,
corp.rm.class = "nonpunct",
corp.rm.tag = c(),
quiet = FALSE)
## S4 method for signature 'missing'

`lex.div(txt, measure)`

## S4 method for signature 'kRp.TTR,ANY,ANY,ANY'

`x[i]`

## S4 method for signature 'kRp.TTR'

`x[[i]]`

### Arguments

**txt**
An object of class `kRp.text`, containing the tagged text to be analyzed. If `txt` is of class character, it is assumed to be the raw text to be analyzed.

**...**
Only used for the method generic.

**segment**
An integer value for MSTTR, defining how many tokens should form one segment.

**factor.size**
A real number between 0 and 1, defining the MTLD factor size.

**min.tokens**
An integer value, how many tokens a full factor must at least have to be considered for the MTLD-MA result.

**MTLDMA.steps**
An integer value for MTLD-MA, defining the step size for the moving window, in tokens. The original proposal uses an increment of 1. If you increase this value, computation will be faster, but your value can only remain a good estimate if the text is long enough.

**rand.sample**
An integer value, how many tokens should be assumed to be drawn for calculating HD-D.

**window**
An integer value for MATTR, defining how many tokens the moving window should include.

**case.sens**
Logical, whether types should be counted case sensitive.

**lemmatize**
Logical, whether analysis should be carried out on the lemmatized tokens rather than all running word forms.

**detailed**
Logical, whether full details of the analysis should be calculated. This currently affects MTLD and MTLD-MA, defining if all factors should be kept in the object. This slows down calculations considerably.

**measure**
A character vector defining the measures which should be calculated. Valid elements are "TTR", "MSTTR", "MATTR", "C", "R", "CTTR", "U", "S", "K", "Maas", "HD-D", "MTLD" and "MTLD-MA". You can also set it to "validation" to get information on the current status of validation.

**char**

**char.steps**
An integer value defining the step size for characteristic curves, in tokens.

**log.base**
A numeric value defining the base of the logarithm. See `log` for details.
**force.lang**  A character string defining the language to be assumed for the text, by force. See details.

**keep.tokens** Logical. If TRUE, all raw tokens and types will be preserved in the resulting object, in a slot called tt. For the types, also their frequency in the analyzed text will be listed.

**type.index** Logical. If TRUE, the tt slot will contain two named lists of all types with the indices where that particular type is to be found in the original tagged text (type.in.txt) or the list of tokens in these results (type.in.result), respectively.

**corp.rm.class** A character vector with word classes which should be dropped. The default value "nonpunct" has special meaning and will cause the result of kRp.POS.tags(lang, tags=c("punct","sentc"), list.classes=TRUE) to be used.

**corp.rm.tag** A character vector with POS tags which should be dropped.

**as.feature** Logical, whether the output should be just the analysis results or the input object with the results added as a feature. Use corpusLexDiv to get the results from such an aggregated object.

**quiet** Logical. If FALSE, short status messages will be shown. TRUE will also suppress all potential warnings regarding the validation status of measures.

**x** An object of class kRp.TTR.

**i** Defines the row selector ([]) or the name to match ([[]]).

---

**Details**

`lex.div` calculates a variety of proposed indices for lexical diversity. In the following formulae, $N$ refers to the total number of tokens, and $V$ to the number of types:

- **"TTR"**: The ordinary Type-Token Ratio:
  
  $$ TTR = \frac{V}{N} $$

  Wrapper function: TTR

- **"MSTTR"**: For the Mean Segmental Type-Token Ratio (sometimes referred to as Split TTR) tokens are split up into segments of the given size, TTR for each segment is calculated and the mean of these values returned. Tokens at the end which do not make a full segment are ignored. The number of dropped tokens is reported.

  Wrapper function: MSTTR

- **"MATTR"**: The Moving-Average Type-Token Ratio (Covington & McFall, 2010) calculates TTRs for a defined number of tokens (called the "window"), starting at the beginning of the text and moving this window over the text, until the last token is reached. The mean of these TTRs is the MATTR.

  Wrapper function: MATTR

- **"C"**: Herdan's C (Herdan, 1960, as cited in Tweedie & Baayen, 1998; sometimes referred to as LogTTR):

  $$ C = \log V - \log N $$

  Wrapper function: C.1d
"R": Guiraud's Root TTR (Guiraud, 1954, as cited in Tweedie & Baayen, 1998):

\[ R = \frac{V}{\sqrt{N}} \]

Wrapper function: R.1d

"CTTR": Carroll's Corrected TTR:

\[ CTTR = \frac{V}{\sqrt{2N}} \]

Wrapper function: CTTR

"U": Dugast's Uber Index (Dugast, 1978, as cited in Tweedie & Baayen, 1998):

\[ U = \frac{(\lg N)^2}{\lg N - \lg V} \]

Wrapper function: U.1d

"S": Summer's index:

\[ S = \frac{\lg \lg V}{\lg \lg N} \]

Wrapper function: S.1d

"K": Yule's K (Yule, 1944, as cited in Tweedie & Baayen, 1998) is calculated by:

\[ K = 10^4 \times \frac{(\sum_{X=1}^{N} f_X X^2) - N}{N^2} \]

where \( N \) is the number of tokens, \( X \) is a vector with the frequencies of each type, and \( f_X \) is the frequencies for each \( X \).

Wrapper function: K.1d

"Maas": Maas’ indices (\( a, \lg V_0 \) & \( \lg e V_0 \)):

\[ a^2 = \frac{\lg N - \lg V}{\lg N^2} \]

\[ \lg V_0 = \frac{\lg V}{\sqrt{1 - \frac{\lg e V_0}{\lg N}}} \]

Earlier versions (koRpus < 0.04-12) reported \( a^2 \), and not \( a \). The measure was derived from a formula by Müller (1969, as cited in Maas, 1972). \( \lg e V_0 \) is equivalent to \( \lg V_0 \), only with \( e \) as the base for the logarithms. Also calculated are \( a, \lg V_0 \) (both not the same as before) and \( V' \) as measures of relative vocabulary growth while the text progresses. To calculate these measures, the first half of the text and the full text will be examined (see Maas, 1972, p. 67 ff. for details).

Wrapper function: maas

"MTLD": For the Measure of Textual Lexical Diversity (McCarthy & Jarvis, 2010) so called factors are counted. Each factor is a subsequent stream of tokens which ends (and is then counted as a full factor) when the TTR value falls below the given factor size. The value of remaining partial factors is estimated by the ratio of their current TTR to the factor size threshold. The MTLD is the total number of tokens divided by the number of factors. The procedure is done twice, both forward and backward for all tokens, and the mean of both calculations is the final MTLD result.

Wrapper function: MTLD
"MTLD-MA": The Moving-Average Measure of Textual Lexical Diversity (Jarvis, no year) combines factor counting and a moving window similar to MATTR: After each full factor the next one is calculated from one token after the last starting point. This is repeated until the end of text is reached for the first time. The average of all full factor lengths is the final MTLD-MA result. Factors below the min.tokens threshold are dropped.

Wrapper function: MTLD

"HD-D": The HD-D value can be interpreted as the idealized version of vocd-D (see McCarthy & Jarvis, 2007). For each type, the probability is computed (using the hypergeometric distribution) of drawing it at least one time when drawing randomly a certain number of tokens from the text – 42 by default. The sum of these probabilities make up the HD-D value. The sum of probabilities relative to the drawn sample size (ATTR) is also reported.

Wrapper function: HDD

By default, if the text has to be tagged yet, the language definition is queried by calling get.kRp.env(lang=TRUE) internally. Or, if txt has already been tagged, by default the language definition of that tagged object is read and used. Set force.lang=get.kRp.env(lang=TRUE) or to any other valid value, if you want to forcibly overwrite this default behaviour, and only then. See kRp.POS.tags for all supported languages.

Value

Depending on as.feature, either an object of class kRp.TTR, or an object of class kRp.text with the added feature lex_div containing it.

References

See Also

kRp.POS.tags, kRp.text, kRp.TTR

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
}
# call lex.div() on a tokenized text
tokenized.obj <- tokenize(
  txt=sample_file,
  lang="en"
)
# if you call lex.div() without arguments,
# you will get its results directly
ld.results <- lex.div(tokenized.obj, char=c())
# there are [ and [[ methods for these objects
ld.results[["MSTTR"]]
# alternatively, you can also store those results as a
# feature in the object itself
tokenized.obj <- lex.div(
  tokenized.obj,
  char=c(),
  as.feature=TRUE
)
# results are now part of the object
hasFeature(tokenized.obj)
corpusLexDiv(tokenized.obj)
}

lex.div.num

## Calculate lexical diversity

### Description

This function is a stripped down version of `lex.div`. It does not analyze text, but takes the numbers of tokens and types directly to calculate measures for which this information is sufficient:

- "TTR" The classic Type-Token Ratio
- "C" Herdan’s C
- "R" Guiraud’s Root TTR
- "CTTR" Carroll’s Corrected TTR
- "U" Dugast’s Uber Index
- "S" Summer’s index
- "Maas" Maas’ \( a^2 \)

See `lex.div` for further details on the formulae.

### Usage

```r
lex.div.num(
  num.tokens,
  num.types,
  measure = c("TTR", "C", "R", "CTTR", "U", "S", "Maas"),
)```
linsear.write

log.base = 10,
quiet = FALSE
)

Arguments

num.tokens Numeric, the number of tokens.
num.types Numeric, the number of types.
measure A character vector defining the measures to calculate.
log.base A numeric value defining the base of the logarithm. See log for details.
quiet Logical. If FALSE, short status messages will be shown. TRUE will also suppress all potential warnings regarding the validation status of measures.

Value

An object of class kRp.TTR.

References

See Also

lex.div

Examples

lex.div.num(
  num.tokens=104,
  num.types=43
)

linsear.write  Readability: Linsear Write Index

Description

This is just a convenient wrapper function for readability.
Usage

```
linsear.write(
  txt.file,
  hyphen = NULL,
  parameters = c(short.syll = 2, long.syll = 3, thrs = 20),
  ...)
```

Arguments

- **txt.file**: Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- **hyphen**: An object of class `kRp.hyphen`. If `NULL`, the text will be hyphenated automatically.
- **parameters**: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- **...**: Further valid options for the main function, see `readability` for details.

Details

This function calculates the Linsear Write index. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

Value

An object of class `kRp.readability`.

Examples

```
## Not run:
linsear.write(tagged.text)
## End(Not run)
```

---

**LIX**

*Readability: Björnsson’s Läsfarhetsindex (LIX)*

Description

This is just a convenient wrapper function for `readability`.

Usage

```
LIX(txt.file, parameters = c(char = 6, const = 100), ...)
```
Arguments

txt.file  Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.

parameters  A numeric vector with named magic numbers, defining the relevant parameters for the index.

...  Further valid options for the main function, see readability for details.

Details

This function calculates the readability index ("lasbarhetsindex") by Björnsson. In contrast to readability, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

Value

An object of class kRp.readability.

References

Examples

```r
## Not run:
LIX(tagged.text)
## End(Not run)
```

---

**maas**  
*Lexical diversity: Maas’ indices*

Description

This is just a convenient wrapper function for lex.div.

Usage

```r
maas(txt, char = FALSE, ...)
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txt</td>
<td>An object of class <code>kRp.text</code> containing the tagged text to be analyzed.</td>
</tr>
<tr>
<td>char</td>
<td>Logical, defining whether data for plotting characteristic curves should be calculated.</td>
</tr>
<tr>
<td>...</td>
<td>Further valid options for the main function, see <code>lex.div</code> for details.</td>
</tr>
</tbody>
</table>

Details

This function calculates Maas’ indices ($a^2 \& \lg V_0$). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the index values, and characteristics are off by default.

Value

An object of class `kRp.TTR`.

See Also

`kRp.POS.tags`, `kRp.text`, `kRp.TTR`

Examples

```r
## Not run:
maas(tagged.text)
## End(Not run)
```

Description

This is just a convenient wrapper function for `lex.div`.

Usage

`MATTR(txt, window = 100, char = FALSE, ...)`

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txt</td>
<td>An object of class <code>kRp.text</code> containing the tagged text to be analyzed.</td>
</tr>
<tr>
<td>window</td>
<td>An integer value for MATTR, defining how many tokens the moving window should include.</td>
</tr>
<tr>
<td>char</td>
<td>Logical, defining whether data for plotting characteristic curves should be calculated.</td>
</tr>
<tr>
<td>...</td>
<td>Further valid options for the main function, see <code>lex.div</code> for details.</td>
</tr>
</tbody>
</table>
Details

This function calculates the moving-average type-token ratio (MATTR). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the MATTR value.

Value

An object of class `kRp.TTR`.

References

See Also

`kRp.POS.tags`, `kRp.text`, `kRp.TTR`

Examples

```r
## Not run:
MATTR(tagged.text)
## End(Not run)
```

### MSTTR

**Lexical diversity: Mean Segmental Type-Token Ratio (MSTTR)**

Description

This is just a convenient wrapper function for `lex.div`.

Usage

`MSTTR(txt, segment = 100, ...)`

Arguments

- `txt`: An object of class `kRp.text` containing the tagged text to be analyzed.
- `segment`: An integer value, defining how many tokens should form one segment.
- `...`: Further valid options for the main function, see `lex.div` for details.

Details

This function calculates the mean segmental type-token ratio (MSTTR). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the MSTTR value.
Value

An object of class \texttt{kRp.TTR}.

See Also

\texttt{kRp.POS.tags}, \texttt{kRp.text}, \texttt{kRp.TTR}

Examples

```r
## Not run:
MSTTR(tagged.text)

## End(Not run)
```

**Description**

This is just a convenient wrapper function for \texttt{lex.div}.

**Usage**

```r
MTLD(
  txt,
  factor.size = 0.72,
  min.tokens = 9,
  detailed = FALSE,
  char = FALSE,
  MA = FALSE,
  steps = 1,
  ...
)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{txt}</td>
<td>An object of class \texttt{kRp.text} containing the tagged text to be analyzed.</td>
</tr>
<tr>
<td>\texttt{factor.size}</td>
<td>A real number between 0 and 1, defining the MTLD factor size.</td>
</tr>
<tr>
<td>\texttt{min.tokens}</td>
<td>An integer value, how many tokens a full factor must at least have to be considered for the MTLD-MA result.</td>
</tr>
<tr>
<td>\texttt{detailed}</td>
<td>Logical, whether full details of the analysis should be calculated. It defines if all factors should be kept in the object. This slows down calculations considerably.</td>
</tr>
<tr>
<td>\texttt{char}</td>
<td>Logical, defining whether data for plotting characteristic curves should be calculated.</td>
</tr>
<tr>
<td>\texttt{MA}</td>
<td>Logical, defining whether the newer moving-average algorithm (MTLD-MA) should be calculated.</td>
</tr>
</tbody>
</table>
An integer value for MTLD-MA, defining the step size for the moving window, in tokens. The original proposal uses an increment of 1. If you increase this value, computation will be faster, but your value can only remain a good estimate if the text is long enough.

Further valid options for the main function, see `lex.div` for details.

This function calculates the measure of textual lexical diversity (MTLD; see McCarthy & Jarvis, 2010). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the MTLD value, and characteristics are off by default.

If you set `MA=TRUE`, the newer MTLD-MA (moving-average method) is used instead of the classic MTLD.

An object of class `kRp.TTR`.

See Also

`kRp.POS.tags, kRp.text, kRp.TTR`

```
## Not run:
MTLD(tagged.text)
## End(Not run)
```

This is just a convenient wrapper function for `readability`.
Usage

nWS(
    txt.file,
    hyphen = NULL,
    parameters = c(ms.syll = 3, iw.char = 6, es.syll = 1),
    nws1 = c(ms = 19.35, sl = 0.1672, iw = 12.97, es = 3.27, const = 0.875),
    nws2 = c(ms = 20.07, sl = 0.1682, iw = 13.73, const = 2.779),
    nws3 = c(ms = 29.63, sl = 0.1905, const = 1.1144),
    nws4 = c(ms = 27.44, sl = 0.2656, const = 1.693),
    ...
)

Arguments

txt.file Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.

hyphen An object of class kRp.hyphen. If NULL, the text will be hyphenated automatically.

parameters A numeric vector with named magic numbers, defining the relevant parameters for all formulas of the index.

nws1 A numeric vector with named magic numbers for the first of the formulas.

nws2 A numeric vector with named magic numbers for the second of the formulas.

nws3 A numeric vector with named magic numbers for the third of the formulas.

nws4 A numeric vector with named magic numbers for the fourth of the formulas.

Further valid options for the main function, see readability for details.

Details

This function calculates the new Wiener Sachtextformeln (formulas 1 to 4). In contrast to readability, which by default calculates all possible indices, this function will only calculate the index values.

Value

An object of class kRp.readability.

References

Examples

## Not run:
nWS(tagged.text)

## End(Not run)
pasteText

Paste koRpus objects

Description
Paste the text in koRpus objects.

Usage
pasteText(txt, ...)

## S4 method for signature 'kRp.text'
pasteText(
  txt,
  replace = c(hon.kRp = "", hoff.kRp = "\n\n", p.kRp = "\n\n")
)

Arguments
- **txt**: An object of class kRp.text.
- **...**: Additional options, currently unused.
- **replace**: A named character vector to define replacements for koRpus’ internal headline and paragraph tags.

Details
This function takes objects of class kRp.text and pastes only the actual text as is.

Value
An atomic character vector.

Examples
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  tokenized.obj <- jumbleWords(tokenized.obj)
  pasteText(tokenized.obj)
} else {}
plot

Plot method for objects of class kRp.text

Description

Plot method for S4 objects of class kRp.text, plots the frequencies of tagged word classes.

Usage

plot(x, y, ...)

## S4 method for signature 'kRp.text,missing'
plot(x, what = "wclass", ...)

Arguments

x

An object of class kRp.text

y

From the generic plot function, ignored for koRpus class objects.

...

Any other argument suitable for plot()

what

Character string, valid options are:
"wclass": Barplot of distribution of word classes
"letters": Line plot of distribution of word length in letters

See Also

kRp.text

Examples

# code is only run when the English language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  plot(tokenized.obj)
} else {()}
query

A method to get information out of koRpus objects

Description

The method query returns query information from objects of classes kRp.corp.freq and kRp.text.

Usage

query(obj, ...)

## S4 method for signature 'kRp.corp.freq'
query(
  obj,
  var = NULL,
  query,
  rel = "eq",
  as.df = TRUE,
  ignore.case = TRUE,
  perl = FALSE,
  regexp_var = "word"
)

## S4 method for signature 'kRp.text'
query(
  obj,
  var,
  query,
  rel = "eq",
  as.df = TRUE,
  ignore.case = TRUE,
  perl = FALSE,
  regexp_var = "token"
)

## S4 method for signature 'data.frame'
query(
  obj,
  var,
  query,
  rel = "eq",
  as.df = TRUE,
  ignore.case = TRUE,
  perl = FALSE,
  regexp_var = "token"
)
Arguments

obj          An object of class `kRp.corp.freq`, `kRp.text`, or data.frame.

...          Optional arguments, see above.

var          A character string naming a variable in the object (i.e., colname). If set to
             "regexp", `grep1` is called on the column specified by `regexp_var`.

query        A character vector (for words), regular expression, or single number naming
             values to be matched in the variable. Can also be a vector of two numbers to
             query a range of frequency data, or a list of named lists for multiple queries (see
             "Query lists" section in details).

rel          A character string defining the relation of the queried value and desired results.
             Must either be "eq" (equal, the default), "gt" (greater than), "ge" (greater of
             equal), "lt" (less than) or "le" (less or equal). If var="word", is always inter-

as.df        Logical, if TRUE, returns a data.frame, otherwise an object of the input class.
             Ignored if obj is a data frame already.

ignore.case  Logical, passed through to `grep1` if var="regexp".

perl         Logical, passed through to `grep1` if var="regexp".

regexp_var   A character string naming the column to query if var="regexp".

Details

`kRp.corp.freq`: Depending on the setting of the var parameter, will return entries with a matching
character (var="word"), or all entries of the desired frequency (see the examples). A special case
is the need for a range of frequencies, which can be achieved by providing a numerical vector of
two values as the query value, for start and end of the range, respectively. In these cases, if rel is
set to "gt" or "lt", the given range borders are excluded, otherwise they will be included as true
matches.

`kRp.text`: var can be any of the variables in slot tokens. If rel="num", a vector with the row
numbers in which the query was found is returned.

Value

Depending on the arguments, might include whole objects, lists, single values etc.

Query lists

You can combine an arbitrary number of queries in a simple way by providing a list of named lists
to the query parameter, where each list contains one query request. In each list, the first element
name represents the var value of the request, and its value is taken as the query argument. You can
also assign rel, ignore.case and perl for each request individually, and if you don’t, the settings
of the main query call are taken as default (as.df only applies to the final query). The filters will
be applied in the order given, i.e., the second query will be made to the results of the first.
This method calls `subset`, which might actually be even more flexible if you need more control.

`kRp.corp.freq`, `subset`
Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  en_corp <- read.corp.custom(
    tokenized.obj,
    caseSens=FALSE
  )

  # look up frequencies for the word "winner"
  query(en_corp, var="word", query="winner")

  # show all entries with a frequency of exactly 3 in the corpus
  query(en_corp, "freq", 3)

  # now, which tokens appear more than 40000 times in a million?
  query(en_corp, "pmio", 40000, "gt")

  # example for a range request: tokens with a log10 between 4.2 and 4.7
  # (including these two values)
  query(en_corp, "log10", c(4.2, 4.7))

  # (and without them)
  query(en_corp, "log10", c(4.2, 4.7), "gt")

  # example for a list of queries: get words with a frequency between
  # 10000 and 25000 per million and at least four letters
  query(en_corp, query=list(
    list(pmio=c(10000, 25000)),
    list(lttr=4, rel="ge"))
  )

  # get all instances of "the" in a tokenized text object
  query(tokenized.obj, "token", "the")
} else {}
Arguments

- **txt**: An object of class `kRp.text` containing the tagged text to be analyzed.
- **char**: Logical, defining whether data for plotting characteristic curves should be calculated.
- ... Further valid options for the main function, see `lex.div` for details.

Details

This function calculates Guiraud’s R. In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the R value, and characteristics are off by default.

Value

An object of class `kRp.TTR`.

- `kRp.text`
- `kRp.TTR`

Examples

```r
## Not run:
R.ld(tagged.text)
## End(Not run)
```

---

**read.BAWL**  
*Import BAWL-R data*

Description

Read the Berlin Affective Word List – Reloaded (V"o, Conrad, Kuchinke, Hartfeld, Hofmann & Jacobs, 2009; [1]) into a valid object of class `kRp.corp.freq`.

Usage

```r
read.BAWL(csv, fileEncoding = NULL)
```

Arguments

- **csv**: A character string, path to the BAWL-R in CSV2 format.
- **fileEncoding**: A character string naming the encoding of the file, if necessary.
Details

To use this function, you must first export the BAWL-R list into CSV format: Use comma for decimal values and semicolon as value separator (often referred to as CSV2). Once you have successfully imported the word list, you can use the object to perform frequency analysis.

Value

An object of class \texttt{kRp.corp.freq}.

References

See Also

\texttt{kRp.corp.freq, query}

Examples

```r
## Not run:
bawl.corp <- read.BAWL(
  file.path("~","mydata","valence","BAWL-R.csv")
)

# you can now use \texttt{query()} now to create subsets of the word list,
# e.g., only noun with 5 letters and an valence rating of >= 1
bawl.stimulus <- query(bawl.corp,
  query=list(
    list(wclass="noun"),
    list(littr=5),
    list("EMO_MEAN"=1, rel="ge")
  )
)
```

## End(Not run)

---

**read.corp.celex**

**Import Celex data**

Description

Read data from Celex[1] formatted corpora.
Usage

read.corp.celex(
  celex.path,
  running.words,
  fileEncoding = "ISO_8859-1",
  n = -1,
  caseSens = TRUE
)

Arguments

  celex.path  A character string, path to a frequency file in Celex format to read.
  running.words  An integer value, number of running words in the Celex data corpus to be read.
  fileEncoding  A character string naming the encoding of the Celex files.
  n  An integer value defining how many lines of data should be read if format="flatfile". Reads all at -1.
  caseSens  Logical, if FALSE forces all frequency statistics to be calculated regardless of the tokens’ case. Otherwise, if the imported database supports it, you will get different frequencies for the same tokens in different cases (e.g., “one” and “One”).

Value

An object of class kRp.corp.freq.

References

See Also

kRp.corp.freq

Examples

## Not run:
my.Celex.data <- read.corp.celex(
  file.path("~","mydata","Celex","GERMAN","GFW","GFW.CD"),
  running.words=5952000
)
freq.analysis(
  tokenized.obj,
  corp.freq=my.Celex.data
)
## End(Not run)
Import custom corpus data

Description

Read data from a custom corpus into a valid object of class \texttt{kRp.corp.freq}.

Usage

\begin{verbatim}
read.corp.custom(corpus, caseSens = TRUE, log.base = 10, ...)

## S4 method for signature 'kR\text{p}.text'
read.corp.custom(
  corpus,
  caseSens = TRUE,
  log.base = 10,
  dtm = docTermMatrix(obj = corpus, case.sens = caseSens),
  as.feature = FALSE
)
\end{verbatim}

Arguments

- \texttt{corpus} An object of class \texttt{kR\text{p}.text} (then the column "token" of the tokens slot is used).
- \texttt{caseSens} Logical. If \texttt{FALSE}, all tokens will be matched in their lower case form.
- \texttt{log.base} A numeric value defining the base of the logarithm used for inverse document frequency (idf). See \texttt{log} for details.
- ... Additional options for methods of the generic.
- \texttt{dtm} A document term matrix of the \texttt{corpus} object as generated by \texttt{docTermMatrix}. This argument merely exists for cases where you want to re-use an already existing matrix. By default, it is being created from the \texttt{corpus} object.
- \texttt{as.feature} Logical, whether the output should be just the analysis results or the input object with the results added as a feature. Use \texttt{corpusCorpFreq} to get the results from such an aggregated object.

Details

The methods should enable you to perform a basic text corpus frequency analysis. That is, not just to import analysis results like LCC files, but to import the corpus material itself. The resulting object is of class \texttt{kR\text{p}.corp.freq}, so it can be used for frequency analysis by other functions and methods of this package.

Value

An object of class \texttt{kR\text{p}.corp.freq}.

Depending on \texttt{as.feature}, either an object of class \texttt{kR\text{p}.corp.freq}, or an object of class \texttt{kR\text{p}.text} with the added feature \texttt{corp.freq} containing it.

kRp.corp.freq

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  # call read.corp.custom() on a tokenized text
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  # if you call read.corp.custom() without arguments,
  # you will get its results directly
  en_corp <- read.corp.custom(
    tokenized.obj,
    caseSens=FALSE
  )

  # alternatively, you can also store those results as a
  # feature in the object itself
  tokenized.obj <- read.corp.custom(
    tokenized.obj,
    caseSens=FALSE,
    as.feature=TRUE
  )

  # results are now part of the object
  hasFeature(tokenized.obj)
  corpusCorpFreq(tokenized.obj)
} else {}
Arguments

LCC.path A character string, either path to a .tar/.tar.gz/.zip file in LCC format (flatfile), or the path to the directory with the unpacked archive.

format Either "flatfile" or "MySQL", depending on the type of LCC data.

fileEncoding A character string naming the encoding of the LCC files. Old zip archives used "ISO_8859-1". This option will only influence the reading of meta information, as the actual database encoding is derived from there.

n An integer value defining how many lines of data should be read if format="flatfile". Reads all at -1.

keep.temp Logical. If LCC.path is a tarred/ziped archive, setting keep.temp=TRUE will keep the temporarily unpacked files for further use. By default all temporary files will be removed when the function ends.

prefix Character string, giving the prefix for the file names in the archive. Needed for newer LCC tar archives if they are already decompressed (autodetected if LCC.path points to the tar archive directly).

bigrams Logical, whether information on bigrams should be imported. This is FALSE by default, because it might make the objects quite large. Note that this will only work in n = -1 because otherwise the tokens cannot be looked up.

cooccurrence Logical, like bigrams, but for information on co-occurrences of tokens in a sentence.

caseSens Logical, if FALSE forces all frequency statistics to be calculated regardless of the tokens’ case. Otherwise, if the imported database supports it, you will get different frequencies for the same tokens in different cases (e.g., "one" and "One").

Details

The LCC database can either be unpacked or still a .tar/.tar.gz/.zip archive. If the latter is the case, then all necessary files will be extracted to a temporal location automatically, and by default removed again when the function has finished reading from it.

Newer LCC archives no longer feature the *-meta.txt file, resulting in less meta information in the object. In these cases, the total number of tokens is calculated as the sum of types’ frequencies.

Value

An object of class kRp.corp.freq.

Note

Please note that MySQL support is not implemented yet.

**Examples**

```r
## Not run:
# old format .zip archive
my.LCC.data <- read.corp.LCC(
  file.path("~", "mydata", "corpora", "de05_3M.zip")
)
# new format tar archive
my.LCC.data <- read.corp.LCC(
  file.path("~", "mydata", "corpora", "rus_web_2002_300K-text.tar")
)
# in case the tar archive was already unpacked
my.LCC.data <- read.corp.LCC(
  file.path("~", "mydata", "corpora", "rus_web_2002_300K-text"),
  prefix="rus_web_2002_300K-"
)
freq.analysis(
  tokenized.obj,
  corp.freq=my.LCC.data
)
## End(Not run)
```

---

**readability**

*Measure readability*

**Description**

These methods calculate several readability indices.

**Usage**

```r
readability(txt.file, ...)
```

```r
## S4 method for signature 'kRp.text'
readability(
  txt.file,
  hyphen = NULL,
```
parameters = list(),
word.lists = list(Bormuth = NULL, Dale.Chall = NULL, Harris.Jacobson = NULL, Spache = NULL),
fileEncoding = "UTF-8",
sentc.tag = "sentc",
nonword.class = "nonpunct",
nonword.tag = c(),
quiet = FALSE,
keep.input = NULL,
as.feature = FALSE)

## S4 method for signature 'missing'
readability(txt.file, index)

## S4 method for signature 'kRp.readability,ANY,ANY,ANY'
x[i]

## S4 method for signature 'kRp.readability'
x[[i]]

Arguments

- **txt.file** An object of class *kRp.text*.
- **...** Additional arguments for the generics.
- **hyphen** An object of class *kRp.hyphen*. If NULL, the text will be hyphenated automatically. All syllable handling will be skipped automatically if it’s not needed for the selected indices.
- **index** A character vector, indicating which indices should actually be computed. If set to "all", then all available indices will be tried (meaning all variations of all measures). If set to "fast", a subset of the default values is used that is known to compute fast (currently, this only excludes "FOG"). You can also set it to "validation" to get information on the current status of validation.
- **parameters** A list with named magic numbers, defining the relevant parameters for each index. If none are given, the default values are used.
- **word.lists** A named list providing the word lists for indices which need one. If NULL or missing, the indices will be skipped and a warning is giving. Actual word lists can be provided as either a vector (or matrix or data.frame with only one column), or as a file name, where this file must contain one word per line. Alternatively, you can provide the number of words which are not on the list, directly.
- **fileEncoding** A character string defining the character encoding of the word.lists in case they are provided as files, like "Latin1" or "UTF-8".
sentc.tag  A character vector with POS tags which indicate a sentence ending. The default value "sentc" has special meaning and will cause the result of kRp.POS.tags(lang, tags="sentc", list.tags=TRUE) to be used.

nonword.class  A character vector with word classes which should be ignored for readability analysis. The default value "nonpunct" has special meaning and will cause the result of kRp.POS.tags(lang, tags=c("punct","sentc"), list.classes=TRUE) to be used. Will only be of consequence if hyphen is not set!

nonword.tag  A character vector with POS tags which should be ignored for readability analysis. Will only be of consequence if hyphen is not set!

quiet  Logical. If FALSE, short status messages will be shown. TRUE will also suppress all potential warnings regarding the validation status of measures.

keep.input  Logical. If FALSE, neither the object provided by (or generated from) txt.file nor hyphen will be kept in the output object. By default (NULL) they are kept if the input was not already of the needed object class (e.g., kRp.text) or missing, to allow for re-use without the need to tag or hyphenate the text again. If TRUE, they are always kept. In cases where you want smaller object sizes, set this to FALSE to always drop these slots.

as.feature  Logical, whether the output should be just the analysis results or the input object with the results added as a feature. Use corpusReadability to get the results from such an aggregated object.

x  An object of class kRp.readability.

i  Defines the row selector ([]) or the name to match ([[]).

Details

In the following formulae, \( W \) stands for the number of words, \( St \) for the number of sentences, \( C \) for the number of characters (usually meaning letters), \( Sy \) for the number of syllables, \( W_{3Sy} \) for the number of words with at least three syllables, \( W_{<3Sy} \) for the number of words with less than three syllables, \( W_{1Sy} \) for words with exactly one syllable, \( W_{6C} \) for the number of words with at least six letters, and \( W_{-WL} \) for the number of words which are not on a certain word list (explained where needed).

"ARI": Automated Readability Index:

\[
ARI = 0.5 \times \frac{W}{St} + 4.71 \times \frac{C}{W} - 21.43
\]

If parameters is set to \( \text{ARI="NRI"} \), the revised parameters from the Navy Readability Indexes are used:

\[
ARI_{NRI} = 0.4 \times \frac{W}{St} + 6 \times \frac{C}{W} - 27.4
\]

If parameters is set to \( \text{ARI="simple"} \), the simplified formula is calculated:

\[
ARI_{\text{simple}} = \frac{W}{St} + 9 \times \frac{C}{W}
\]

Wrapper function: \( \text{ARI} \)
"Bormuth": Bormuth Mean Cloze & Grade Placement:

\[ B_{MC} = 0.886593 - \left( 0.08364 \times \frac{C}{W} \right) + 0.161911 \times \left( \frac{W_{WL}}{W} \right)^3 \]

\[ -0.21401 \times \left( \frac{W}{St} \right) + 0.000577 \times \left( \frac{W}{St} \right)^2 \]

\[ -0.000005 \times \left( \frac{W}{St} \right)^3 \]

**Note:** This index needs the long Dale-Chall list of 3000 familiar (english) words to compute \( W_{-WL} \). That is, you must have a copy of this word list and provide it via the \texttt{word.lists=list(Bormuth=<your.list>)} parameter!

\[ B_{GP} = 4.275 + 12.881 \times B_{MC} - (34.934 \times B_{MC}^2) + (20.388 \times B_{MC}^3) \]

\[ +(26.194 - 2.046C_{CS}^2) - (11.767C_{CS}) - (44.285 \times B_{MC} \times C_{CS}) \]

\[ +(97.620 \times (B_{MC} \times C_{CS})^2) - (59.538 \times (B_{MC} \times C_{CS})^3) \]

Where \( C_{CS} \) represents the cloze criterion score (35% by default).

Wrapper function: \texttt{bormuth}

"Coleman": Coleman’s Readability Formulas:

\[ C_1 = 1.29 \times \left( \frac{100 \times W^{1Sy}}{W} \right) - 38.45 \]

\[ C_2 = 1.16 \times \left( \frac{100 \times W^{1Sy}}{W} \right) + 1.48 \times \left( \frac{100 \times St}{W} \right) - 37.95 \]

\[ C_3 = 1.07 \times \left( \frac{100 \times W^{1Sy}}{W} \right) + 1.18 \times \left( \frac{100 \times St}{W} \right) + 0.76 \times \left( \frac{100 \times W_{pron}}{W} \right) - 34.02 \]

\[ C_4 = 1.04 \times \left( \frac{100 \times W^{1Sy}}{W} \right) + 1.06 \times \left( \frac{100 \times St}{W} \right) + 0.56 \times \left( \frac{100 \times W_{pron}}{W} \right) - 0.36 \times \left( \frac{100 \times W_{prep}}{W} \right) - 26.01 \]

Where \( W_{pron} \) is the number of pronouns, and \( W_{prep} \) the number of prepositions.

Wrapper function: \texttt{coleman}

"Coleman.Liau": First estimates cloze percentage, then calculates grade equivalent:

\[ C_{LECP} = 141.8401 - 0.214590 \times \frac{100 \times C}{W} + 1.079812 \times \frac{100 \times St}{W} \]

\[ CL_{grade} = -27.4004 \times \frac{C_{LECP}}{100} + 23.06395 \]

The short form is also calculated:

\[ C_{Lshort} = 5.88 \times \frac{C}{W} - 29.6 \times \frac{St}{W} - 15.8 \]

Wrapper function: \texttt{coleman.liau}
"Dale.Chall": New Dale-Chall Readability Formula. By default the revised formula (1995) is calculated:

\[
DC_{\text{new}} = 64 - 0.95 \times \frac{100 \times W_{WL}}{W} - 0.69 \times \frac{W}{St}
\]

This will result in a cloze score which is then looked up in a grading table. If parameters is set to Dale.Chall="old", the original formula (1948) is used:

\[
DC_{\text{old}} = 0.1579 \times \frac{100 \times W_{WL}}{W} + 0.0496 \times \frac{W}{St} + 3.6365
\]

If parameters is set to Dale.Chall="PSK", the revised parameters by Powers-Sumner-Kearl (1958) are used:

\[
DC_{\text{PSK}} = 0.1155 \times \frac{100 \times W_{WL}}{W} + 0.0596 \times \frac{W}{St} + 3.2672
\]

Note: This index needs the long Dale-Chall list of 3000 familiar (english) words to compute \( W_{WL} \). That is, you must have a copy of this word list and provide it via the \text{word.lists=list(Dale.Chall=<your.list>)} parameter!

Wrapper function: \text{dale.chall}

"Danielson.Bryan":

\[
DB_1 = \left( 1.0364 \times \frac{C}{Bl} \right) + \left( 0.0194 \times \frac{C}{St} \right) - 0.6059
\]

\[
DB_2 = 131.059 - \left( 10.364 \times \frac{C}{Bl} \right) - \left( 0.194 \times \frac{C}{St} \right)
\]

Where \( Bl \) means blanks between words, which is not really counted in this implementation, but estimated by \( words - 1 \). \( C \) is interpreted as literally all characters.

Wrapper function: \text{danielson.bryan}

"Dickes.Steiwer": Dickes-Steiwer Handformel:

\[
DS = 235.95993 - \left( 73.021 \times \frac{C}{W} \right) - \left( 12.56438 \times \frac{W}{St} \right) - (50.03293 \times TTR)
\]

Where \( TTR \) refers to the type-token ratio, which will be calculated case-insensitive by default.

Wrapper function: \text{dickes.steiwer}

"DRP": Degrees of Reading Power. Uses the Bormuth Mean Cloze Score:

\[
DRP = (1 - B_{MC}) \times 100
\]

This formula itself has no parameters. Note: The Bormuth index needs the long Dale-Chall list of 3000 familiar (english) words to compute \( W_{WL} \). That is, you must have a copy of this word list and provide it via the \text{word.lists=list(Bormuth=<your.list>)} parameter!

Wrapper function: \text{DRP}

"ELF": Fang’s Easy Listening Formula:

\[
ELF = \frac{W_{2Sy}}{St}
\]

Wrapper function: \text{ELF}
"Farr.Jenkins.Paterson": A simplified version of Flesch Reading Ease:

\[ FJP = -31.517 - 1.015 \times \frac{W}{St} + 1.599 \times \frac{W_{1 Sy}}{W} \]

If parameters is set to Farr_Jenkins_Paterson="PSK", the revised parameters by Powers-Sumner-Kearl (1958) are used:

\[ FJP_{PSK} = 8.4335 + 0.0923 \times \frac{W}{St} - 0.0648 \times \frac{W_{1 Sy}}{W} \]

Wrapper function: \texttt{farr.jenkins.paterson}

"Flesch": \textit{Flesch Reading Ease}:

\[ FEN = 206.835 - 1.015 \times \frac{W}{St} - 84.6 \times \frac{Sy}{W} \]

Certain internationalisations of the parameters are also implemented. They can be used by setting the \texttt{Flesch} parameter to one of the following language abbreviations.

"de" (Amstad's Verständlichkeitsindex):

\[ FDE = 180 - \frac{W}{St} - 58.5 \times \frac{Sy}{W} \]

"es" (Fernandez-Huerta):

\[ FES = 206.835 - 1.02 \times \frac{W}{St} - 60 \times \frac{Sy}{W} \]

"es-s" (Szigriszt):

\[ FESS = 206.835 - \frac{W}{St} - 62.3 \times \frac{Sy}{W} \]

"nl" (Douma):

\[ FNL = 206.835 - 0.93 \times \frac{W}{St} - 77 \times \frac{Sy}{W} \]

"nl-b" (Brouwer Leesindex):

\[ FNLB = 195 - 2 \times \frac{W}{St} - 67 \times \frac{Sy}{W} \]

"fr" (Kandel-Moles):

\[ FFR = 209 - 1.15 \times \frac{W}{St} - 68 \times \frac{Sy}{W} \]

If parameters is set to \texttt{Flesch="PSK"}, the revised parameters by Powers-Sumner-Kearl (1958) are used to calculate a grade level:

\[ FPSK = 0.0778 \times \frac{W}{St} + 4.55 \times \frac{Sy}{W} - 2.2029 \]

Wrapper function: \texttt{flesch}

"Flesch.Kincaid": \textit{Flesch-Kincaid Grade Level}:

\[ FK = 0.39 \times \frac{W}{St} + 11.8 \times \frac{Sy}{W} - 15.59 \]

Wrapper function: \texttt{flesch.kincaid}
"FOG": Gunning Frequency of Gobbledygook:

\[ FOG = 0.4 \times \left( \frac{W}{St} + \frac{100 \times W_{3Sy}}{W} \right) \]

If parameters is set to FOG="PSK", the revised parameters by Powers-Sumner-Kearl (1958) are used:

\[ FOG_{PSK} = 3.0680 + \left( 0.0877 \times \frac{W}{St} \right) + \left( 0.0984 \times \frac{100 \times W_{3Sy}}{W} \right) \]

If parameters is set to FOG="NRI", the new FOG count from the Navy Readability Indexes is used:

\[ FOG_{new} = \frac{W_{<3Sy} + (3W_{3Sy})}{100 \times W} - 3 \]

If the text was POS-tagged accordingly, proper nouns and combinations of only easy words will not be counted as hard words, and the syllables of verbs ending in "-ed", "-es" or "-ing" will be counted without these suffixes.

Due to the need to re-hyphenate combined words after splitting them up, this formula takes considerably longer to compute than most others. If will be omitted if you set index="fast" instead of the default.

Wrapper function: FOG

"FORCAST":

\[ FORCAST = 20 - \frac{W^{1Sy} \times 150}{W} \]

If parameters is set to FORCAST="RGL", the parameters for the precise reading grade level are used (see Klare, 1975, pp. 84–85):

\[ FORCAST_{RGL} = 20.43 - 0.11 \times W^{1Sy} \times \frac{150}{W} \]

Wrapper function: FORCAST

"Fucks": Fucks' Stilcharakteristik (Fucks, 1955, as cited in Briest, 1974):

\[ Fucks = \frac{S_y}{W} \times \frac{W}{St} \]

This simple formula has no parameters.

Wrapper function: fucks

"Gutierrez": Gutiérrez de Polini's Fórmula de comprensibilidad (Gutiérrez, 1972, as cited in Fernández, 2016) for Spanish:

\[ Gutierrez = 95.2 - \frac{9.7 \times C}{W} - \frac{0.35 \times W}{St} \]

Wrapper function: gutierrez
"Harris.Jacobson": Revised Harris-Jacobson Readability Formulas (Harris & Jacobson, 1974):

For primary-grade material:

\[ HJ_1 = 0.094 \times \frac{100 \times W - W_L}{W} + 0.168 \times \frac{W}{St} + 0.502 \]

For material above third grade:

\[ HJ_2 = 0.140 \times \frac{100 \times W - W_L}{W} + 0.153 \times \frac{W}{St} + 0.560 \]

For material below forth grade:

\[ HJ_3 = 0.158 \times \frac{W}{St} + 0.055 \times \frac{100 \times W_6C}{W} + 0.355 \]

For material below forth grade:

\[ HJ_4 = 0.070 \times \frac{100 \times W - W_L}{W} + 0.125 \times \frac{W}{St} + 0.037 \times \frac{100 \times W_6C}{W} + 0.497 \]

For material above third grade:

\[ HJ_5 = 0.118 \times \frac{100 \times W - W_L}{W} + 0.134 \times \frac{W}{St} + 0.032 \times \frac{100 \times W_6C}{W} + 0.424 \]

Note: This index needs the short Harris-Jacobson word list for grades 1 and 2 (english) to compute \( W - W_L \). That is, you must have a copy of this word list and provide it via the word.lists=list(Harris.Jacobson=<your.list>) parameter!

Wrapper function: harris.jacobson

"Linsear.Write" (O’Hayre, undated, see Klare, 1975, p. 85):

\[ LW_{raw} = \frac{100 - \frac{100 \times W_{3Sy} }{W} + \left( 3 \times \frac{100 \times W_{3Sy} }{W} \right)}{100 \times St} \]

\[ LW(LW_{raw} \leq 20) = \frac{LW_{raw} - 2}{2} \]

\[ LW(LW_{raw} > 20) = \frac{LW_{raw}}{2} \]

Wrapper function: linsear.write

"LIX" Björnsson’s Läsbarhetsindex. Originally proposed for Swedish texts, calculated by:

\[ LIX = \frac{W}{St} + \frac{100 \times W_{7C}}{W} \]

Texts with a LIX < 25 are considered very easy, around 40 normal, and > 55 very difficult to read.

Wrapper function: LIX

"nWS": Neue Wiener Sachtextformeln (Bamberger & Vanecek, 1984):

\[ nWS_1 = 19.35 \times \frac{W_{3Sy}}{W} + 0.1672 \times \frac{W}{St} + 12.97 \times \frac{W_6C}{W} - 3.27 \times \frac{W_{1Sy}}{W} - 0.875 \]
\[
\begin{align*}
nWS_2 &= 20.07 \times \frac{W_{3 Sy}}{W} + 0.1682 \times \frac{W}{St} + 13.73 \times \frac{W_{6 C}}{W} - 2.779 \\
nWS_3 &= 29.63 \times \frac{W_{3 Sy}}{W} + 0.1905 \times \frac{W}{St} - 1.1144 \\
nWS_4 &= 27.44 \times \frac{W_{3 Sy}}{W} + 0.2656 \times \frac{W}{St} - 1.693
\end{align*}
\]

Wrapper function: \texttt{nWS}

“RIX” Anderson’s \textit{Readability Index}. A simplified version of LIX:

\[
RIX = \frac{W_{7 C}}{St}
\]

Texts with a RIX < 1.8 are considered very easy, around 3.7 normal, and > 7.2 very difficult to read.

Wrapper function: \texttt{RIX}

“SMOG”: \textit{Simple Measure of Gobbledygook}. By default calculates formula D by McLaughlin (1969):

\[
SMOG = 1.043 \times \sqrt{W_{3 Sy} \times \frac{30}{St}} + 3.1291
\]

If parameters is set to \texttt{SMOG="C"}, formula C will be calculated:

\[
SMOG_C = 0.9986 \times \sqrt{W_{3 Sy} \times \frac{30}{St}} + 5 + 2.8795
\]

If parameters is set to \texttt{SMOG="simple"}, the simplified formula is used:

\[
SMOG_{simple} = \sqrt{W_{3 Sy} \times \frac{30}{St}} + 3
\]

If parameters is set to \texttt{SMOG="de"}, the formula adapted to German texts ("Qu", Bamberger & Vanecek, 1984, p. 78) is used:

\[
SMOG_{de} = \sqrt{W_{3 Sy} \times \frac{30}{St}} - 2
\]

Wrapper function: \texttt{SMOG}

\[
Spache = 0.121 \times \frac{W}{St} + 0.082 \times \frac{100 \times W_{-WL}}{W} + 0.659
\]

If parameters is set to \texttt{Spache="old"}, the original parameters (Spache, 1953) are used:

\[
Spache_{old} = 0.141 \times \frac{W}{St} + 0.086 \times \frac{100 \times W_{-WL}}{W} + 0.839
\]

\textbf{Note:} The revised index needs the revised Spache word list (see Klare, 1975, p. 73), and the old index the short Dale-Chall list of 769 familiar (english) words to compute \(W_{-WL}\). That is, you must have a copy of this word list and provide it via the \texttt{word.lists=list(Spache=<your.list>)} parameter!

Wrapper function: \texttt{spache}
"Strain": Strain Index. This index was proposed in [1]:

\[ S = S_y \times \frac{1}{St^{1/3}} \times \frac{1}{10} \]

Wrapper function: strain

"Traenkle.Bailer": Tränkle-Bailer Formeln. These two formulas were the result of a re-examination of the ones proposed by Dickes-Steiwer. They try to avoid the usage of the type-token ratio, which is dependent on text length (Tränkle & Bailer, 1984):

\[ TB1 = 224.6814 - \left( 79.8304 \times \frac{C}{W} \right) - \left( 12.24032 \times \frac{W}{St} \right) - \left( 1.292857 \times \frac{100 \times W_{prep}}{W} \right) \]

\[ TB2 = 234.1063 - \left( 96.11069 \times \frac{C}{W} \right) - \left( 2.05444 \times \frac{100 \times W_{prep}}{W} \right) - \left( 1.02805 \times \frac{100 \times W_{conj}}{W} \right) \]

Where \( W_{prep} \) refers to the number of prepositions, and \( W_{conj} \) to the number of conjunctions.

Wrapper function: traenkle.bailer

"TRI": Kuntzsch’s Text-Redundanz-Index. Intended mainly for German newspaper comments.

\[ TRI = (0.449 \times W^{1.5y}) - (2.467 \times Ptn) - (0.937 \times Frg) - 14.417 \]

Where \( Ptn \) is the number of punctuation marks and \( Frg \) the number of foreign words.

Wrapper function: TRI

"Tuldava": Tuldava’s Text Difficulty Formula. Supposed to be rather independent of specific languages (Grzybek, 2010).

\[ TD = \frac{S_y}{W} \times \ln \left( \frac{W}{St} \right) \]

Wrapper function: tuldava

\[ WS = \frac{W}{St} \times \frac{10 \times W_{2Sy}}{W} \]

If parameters is set to Wheeler.Smith="de", the calculation stays the same, but grade placement is done according to Bamberger & Vanecek (1984), that is for german texts.

Wrapper function: wheeler.smith

By default, if the text has to be tagged yet, the language definition is queried by calling get.kRp.env(lang=TRUE) internally. Or, if txt has already been tagged, by default the language definition of that tagged object is read and used. Set force.lang=get.kRp.env(lang=TRUE) or to any other valid value, if you want to forcibly overwrite this default behaviour, and only then. See kRp.POS.tags for all supported languages.

Value

Depending on as.feature, either an object of class kRp.readability, or an object of class kRp.text with the added feature readability containing it.
Note

To get a printout of the default parameters like they’re set if no other parameters are specified, call `readability(parameters="dput")`. In case you want to provide different parameters, you must provide a complete set for an index, or special parameters that are mentioned in the index descriptions above (e.g., "PSK", if appropriate).

References

Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  # call readability() on a tokenized text
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  # if you call readability() without arguments,
  # you will get its results directly
  rdb.results <- readability(tokenized.obj)

  # there are [ and [[ methods for these objects
  rdb.results[["ARI"]]

  # alternatively, you can also store those results as a
  # feature in the object itself
  tokenized.obj <- readability(
    tokenized.obj,
    as.feature=TRUE
  )
  # results are now part of the object
  hasFeature(tokenized.obj)
  corpusReadability(tokenized.obj)
} else {}
readability.num

Usage

readability.num(
  txt.features = list(sentences = NULL, words = NULL, letters = c(all = 0, 15 = 0, 16 = 0), syllables = c(all = 0, s1 = 0, s2 = 0), punct = NULL, all.chars = NULL, prepositions = NULL, conjunctions = NULL, pronouns = NULL, foreign = NULL, TTR = NULL, FOG.hard.words = NULL, Bormuth.NOL = NULL, Dale.Chall.NOL = NULL, Harris.Jacobson.NOL = NULL, Spache.NOL = NULL, lang = character()),
  parameters = list()
)

Arguments

txt.features A named list with statistical information on the text, or an object of class kRp.readability (only its desc slot will then be used). Valid values are:

  sentences: The number of sentences.
  words: The number of words.
  letters: A named vector providing the number of letters. Must contain a value called "all", the total number of letters, and several values called "l<digit>", giving the number of words with <digit> letters. To calculate all implemented measures with default parameters, you need at least the values "15" (words with five or less letters) and "16" (words with six letters).
  syllables: Similar to letters, but providing the number of syllables. Must contain a value called "all", the total number of syllables, and several values called "s<digit>", giving the number of words with <digit> syllables. To calculate all implemented measures with default parameters, you need at least the values "s1" and "s2". Only needed to calculate measures which need syllable count (see readability).
  punct: The number of punctuation characters. Only needed to calculate "TRI".
  all.chars: The number of all characters (including spaces). Only needed to calculate Danielson.Bryan.
  prepositions: The number of prepositions. Only needed to calculate "Coleman" and "Traenkle.Bailer".
  conjunctions: The number of conjunctions. Only needed to calculate "Traenkle.Bailer".
  pronouns: The number of pronouns. Only needed to calculate "Coleman".
  foreign: The number of foreign words. Only needed to calculate "TRI".
  TTR: The type-token ratio. Only needed to calculate "Dickes.Steiwer".
  FOG.hard.words: The number of hard words, counted according to FOG. Only needed to calculate "FOG".
  Bormuth.NOL: Number of words not on the Bormuth word list. Only needed to calculate "Bormuth".
Dale.Chall.NOL: Number of words not on the Dale-Chall word list. Only needed to calculate "Dale.Chall".

Harris.Jacobson.NOL: Number of words not on the Harris-Jacobson word list. Only needed to calculate "Harris.Jacobson".

Spache.NOL: Number of words not on the Spache word list. Only needed to calculate "Spache".

lang: A character string defining the language, if needed.

index: A character vector, indicating which indices should actually be computed.

parameters: A named list with magic numbers, defining the relevant parameters for each index. If none are given, the default values are used.

Examples

```r
## Not run:

test.features <- list(
  sentences=18,
  words=556,
  letters=c(
    all=2918,
    l1=19,
    l2=92,
    l3=74,
    l4=80,
    l5=51,
    l6=49
  ),
  syllables=c(
    all=974,
    s1=316,
    s2=116
  ),
  punct=78,
  all.chars=3553,
  prepositions=74,
  conjunctions=18,
  pronouns=9,
  foreign=0,
  TTR=0.5269784,
  Bormuth.NOL=192,
  Dale.Chall.NOL=192,
  Harris.Jacobson.NOL=240,
  Spache.NOL=240,
  lang="en"
)

# should not calculate FOG, because FOG.hard.words is missing:
readability.num(test.features, index="all")

## End(Not run)
```
Import already tagged texts

Description

This method can be used on text files or matrices containing already tagged text material, e.g. the results of TreeTagger[1].

Usage

readTagged(file, ...)

## S4 method for signature 'matrix'
readTagged(
  file,
  lang = "kRp.env",
  tagger = "TreeTagger",
  apply.sentc.end = TRUE,
  sentc.end = c(".", "!", "?", ",", ":"),
  stopwords = NULL,
  stemmer = NULL,
  rm.sgml = TRUE,
  doc_id = NA,
  add.desc = "kRp.env",
  mtx_cols = c(token = "token", tag = "tag", lemma = "lemma")
)

## S4 method for signature 'data.frame'
readTagged(
  file,
  lang = "kRp.env",
  tagger = "TreeTagger",
  apply.sentc.end = TRUE,
  sentc.end = c(".", "!", "?", ",", ":"),
  stopwords = NULL,
  stemmer = NULL,
  rm.sgml = TRUE,
  doc_id = NA,
  add.desc = "kRp.env",
  mtx_cols = c(token = "token", tag = "tag", lemma = "lemma")
)

## S4 method for signature 'kRp.connection'
readTagged(
  file,
  lang = "kRp.env",
  encoding = getOption("encoding"),
### readTagged

`readTagged`

```r
tagger = "TreeTagger",
apply.sentc.end = TRUE,
sentc.end = c(".", "!", "?", ",", ":"),
stopwords = NULL,
stemmer = NULL,
rm.sgml = TRUE,
doc_id = NA,
add.desc = "kRp.env"
)
```

## S4 method for signature 'character'

`readTagged`

```r
readTagged(
  file,
  lang = "kRp.env",
  encoding = getOption("encoding"),
tagger = "TreeTagger",
apply.sentc.end = TRUE,
sentc.end = c(".", "!", "?", ",", ":"),
stopwords = NULL,
stemmer = NULL,
rm.sgml = TRUE,
doc_id = NA,
add.desc = "kRp.env"
)
```

**Arguments**

- `file` Either a matrix, a connection or a character vector. If the latter, that must be a valid path to a file, containing the previously analyzed text. If it is a matrix, it must contain three columns named "token", "tag", and "lemma", and except for these three columns all others are ignored.
- `...` Additional options, currently unused.
- `lang` A character string naming the language of the analyzed corpus. See `kRp.POS.tags` for all supported languages. If set to "kRp.env" this is got from `get.kRp.env`.
- `tagger` The software which was used to tokenize and tag the text. Currently, "TreeTagger" and "manual" are the only supported values. If "manual", you must also adjust the values of `mtx_cols` to define the columns to be imported.
- `apply.sentc.end` Logical, whether the tokens defined in `sentc.end` should be searched and set to a sentence ending tag. You could call this a compatibility mode to make sure you get the results you would get if you called `treetag` on the original file. If set to FALSE, the tags will be imported as they are.
- `sentc.end` A character vector with tokens indicating a sentence ending. This adds to given results, it doesn’t replace them.
- `stopwords` A character vector to be used for stopword detection. Comparison is done in lower case. You can also simply set `stopwords=tm::stopwords("en")` to use the english stopwords provided by the tm package.
stemmer

A function or method to perform stemming. For instance, you can set `stemmer=Snowball::SnowballStemmer` if you have the Snowball package installed (or `SnowballC::wordStem`). As of now, you cannot provide further arguments to this function.

rm.sgml

Logical, whether SGML tags should be ignored and removed from output.

doc_id

Character string, optional identifier of the particular document. Will be added to the desc slot.

add.desc

Logical. If TRUE, the tag description (column "desc" of the data.frame) will be added directly to the resulting object. If set to "kRp.env" this is fetched from `get.kRp.env`. Only needed if `tag=TRUE`.

mtx.cols

Character vector with exactly three elements named "token", "tag", and "lemma", the values of which must match the respective column names of the matrix provided via file. It is possible to set `lemma=NA` if the tagged results only provide token and tag. This argument is ignored unless `tagger="manual"` and data is provided as either a matrix or data frame.

coding

A character string defining the character encoding of the input file, like "Latin1" or "UTF-8".

Details

Note that the value of `lang` must match a valid language supported by `kRp.POS.tags`. It will also get stored in the resulting object and might be used by other functions at a later point.

Value

An object of class `kRp.text`. If `debug=TRUE`, prints internal variable settings and attempts to return the original output if the TreeTagger system call in a matrix.

treetag, freq.analysis, get.kRp.env, kRp.text

Examples

```r
## Not run:
# call method on a connection
text_con <- file("~/my.data/tagged_speech.txt", "r")
tagged_results <- readTagged(text_con, lang="en")
close(text_con)

# call it on the file directly
tagged_results <- readTagged("~/my.data/tagged_speech.txt", lang="en")
```
# import the results of RDRPOSTagger, using the "manual" tagger feature
sample_text <- c("Dies ist ein kurzes Beispiel. Es ergibt wenig Sinn.")
tagger <- RDRPOSTagger::rdr_model(language="German", annotation="POS")
tagged_rdr <- RDRPOSTagger::rdr_pos(tagger, x=sample_text)
tagged_results <- readTagged(
  tagged_rdr,
  lang="de",
  tagger="manual",
  mtx_cols=c(token="token", tag="pos", lemma=NA)
)

## End(Not run)

---

**RIX**

Readability: Anderson’s Readability Index (RIX)

### Description

This is just a convenient wrapper function for `readability`.

### Usage

```
RIX(txt.file, parameters = c(char = 6), ...)
```

### Arguments

- **txt.file**
  - Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

- **parameters**
  - A numeric vector with named magic numbers, defining the relevant parameters for the index.

- **...**
  - Further valid options for the main function, see `readability` for details.

### Details

This function calculates the Readability Index (RIX) by Anderson, which is a simplified version of the "asbarhetsindex (LIX) by Bjöörnsson. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

This formula doesn’t need syllable count.

### Value

An object of class `kRp.readability`. 
References

Examples

```r
## Not run:
RIX(tagged.text)
## End(Not run)
```

---

**S.ld**  
*Lexical diversity: Summer’s S*

Description

This is just a convenient wrapper function for `lex.div`.

Usage

```r
S.ld(txt, char = FALSE, ...)
```

Arguments

- `txt`: An object of class `kRp.text` containing the tagged text to be analyzed.
- `char`: Logical, defining whether data for plotting characteristic curves should be calculated.
- `...`: Further valid options for the main function, see `lex.div` for details.

Details

This function calculates Summer’s S. In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the S value, and characteristics are off by default.

Value

An object of class `kRp.TTR`.

See Also

`kRp.POS.tags, kRp.text, kRp.TTR`
segment.optimizer

A function to optimize MSTTR segment sizes

Description

This function calculates an optimized segment size for MSTTR.

Usage

segment.optimizer(txtlgth, segment = 100, range = 20, favour.min = TRUE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txtlgth</td>
<td>Integer value, size of text in tokens.</td>
</tr>
<tr>
<td>segment</td>
<td>Integer value, start value of the segment size.</td>
</tr>
<tr>
<td>range</td>
<td>Integer value, range around segment to search for better fitting sizes.</td>
</tr>
<tr>
<td>favour.min</td>
<td>Logical, whether as a last resort smaller or larger segment sizes should be preferred, if in doubt.</td>
</tr>
</tbody>
</table>

Details

When calculating the mean segmental type-token ratio (MSTTR), tokens are divided into segments of a given size and analyzed. If at the end text is left over which won’t fill another full segment, it is discarded, i.e. information is lost. For interpretation it is debatable which is worse: Dropping more or less actual token material, or variance in segment size between analyzed texts. If you’d prefer the latter, this function might prove helpful.

Starting with a given text length, segment size and range to investigate, segment.optimizer iterates through possible segment values. It returns the segment size which would drop the fewest tokens (zero, if you’re lucky). Should more than one value fulfill this demand, the one nearest to the segment start value is taken. In cases, where still two values are equally far away from the start value, it depends on the setting of favour.min if the smaller or larger segment size is returned.

Value

A numeric vector with two elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seg</td>
<td>The optimized segment size</td>
</tr>
<tr>
<td>drop</td>
<td>The number of tokens that would be dropped using this segment size</td>
</tr>
</tbody>
</table>
set.kRp.env

See Also

lex.div, MSTTR

Examples

segment.optimizer(2014, favour.min=FALSE)

---

set.kRp.env  

A function to set information on your koRpus environment

Description

The function set.kRp.env can be called before any of the analysing functions. It writes information on your session environment regarding the koRpus package, e.g. path to a local TreeTagger installation, to your global .Options.

Usage

set.kRp.env(..., validate = TRUE)

Arguments

...  

Named parameters to set in the koRpus environment. Valid arguments are:

TT.cmd  

A character string pointing to the tagger command you want to use for basic text analysis, or "manual" if you want to set TT.options as well. Set to "tokenize" to use tokenize.

lang  

A character string specifying a valid language.

TT.options  

A list with arguments to be used as TT.options by treetag.

hyph.cache.file  

A character string specifying a path to a file to use for storing already hyphenated data, used by hyphen.

add.desc  

A logical value, whether tag descriptions should be added directly to tagged text objects.

To explicitly unset a value again, set it to an empty character string (e.g., lang="").

validate  

Logical, if TRUE given paths will be checked for actual availability, and the function will fail if files can’t be found.

Details

To get the current settings, the function get.kRp.env should be used. For the most part, set.kRp.env is a convenient wrapper for options. To permanently set some defaults, you could also add respective options calls to an .Rprofile file.

Note that you can also suppress the startup message informing about available.koRpus.lang and install.koRpus.lang by adding noStartupMessage=TRUE to the options in .Rprofile.
set.lang.support

Value

Returns an invisible NULL.

See Also

g.get.kRp.env

Examples

set.kRp.env(lang="en")
get.kRp.env(lang=TRUE)
## Not run:
set.kRp.env(
  TT.cmd=file.path("-","bin","treetagger","cmd","tree-tagger-german"),
  lang="de"
)

# example for setting permanent default values in an .Rprofile file
options(
  koRpus=list(
    TT.cmd="manual",
    TT.options=list(
      path=file.path("-","bin","treetagger"),
      preset="de"),
      lang="de",
      noStartupMessage=TRUE
    )
  )
)
# be aware that setting a permanent default language without loading
# the respective language support package might trigger errors

## End(Not run)

---

set.lang.support  

Add support for new languages

Description

You can use this function to add new languages to be used with koRpus.

Usage

set.lang.support(target, value, merge = TRUE)

Arguments

target  
One of "kRp.POS.tags", "treetag", or "hyphen", depending on what support is to be added.
value  A named list that upholds exactly the structure defined here for its respective target.

merge  Logical, only relevant for the "kRp.POS.tags" target. This argument controls whether value will completely replace an already present tagset definition, or merge all given tags (i.e., replace single tags with an updated definition or add new tags).

Details

Language support in this package is designed to be extended easily. You could call it modular, although it’s actually more "environmental", but nevermind.

To add full new language support, say for Xyzedish, you basically have to call this function three times (or at least twice, see hyphen section below) with different targets. If you would like to re-use this language support, you should consider making it a package.

Be it a package or a script, it should contain all three calls to this function. If it succeeds, it will fill an internal environment with the information you have defined.

The function set.language.support() gets called three times because there’s three functions of koRpus that need language support:

- treetag() needs the preset information from its own start scripts
- kRp.POS.tags() needs to learn all possible POS tags that TreeTagger uses for the given language
- hyphen() needs to know which language pattern tests are available as data files (which you must provide also)

All the calls follow the same pattern – first, you name one of the three targets explained above, and second, you provide a named list as the value for the respective target function.

"treetag"

The presets for the treetag() function are basically what the shell (GNU/Linux, MacOS) and batch (Win) scripts define that come with TreeTagger. Look for scripts called "$TREETAGGER/cmd/tree-tagger-xyzedish" and "$TREETAGGER\cmd\tree-tagger-xyzedish.bat", figure out which call resembles which call and then define them in set.lang.support("treetag") accordingly.

Have a look at the commented template in your koRpus installation directory for an elaborate example.

"kRp.POS.tags"

If Xyzedish is supported by TreeTagger, you should find a tagset definition for the language on its homepage. treetag() needs to know all POS tags that TreeTagger might return, otherwise you will get a self-explaining error message as soon as an unknown tag appears. Notice that this can still happen after you implemented the full documented tag set: sometimes the contributed TreeTagger parameter files added their own tags, e.g., for special punctuation. So please test your tag set well.

As you can see in the template file, you will also have to add a global word class and an explanation for each tag. The former is especially important for further steps like frequency analysis.

Again, please have a look at the commented template and/or existing language support files in the package sources, most of it should be almost self-explaining.
"hyphen"

Using the target "hyphen" will cause a call to the equivalent of this function in the sylly package. See the documentation of its `set.hyph.support` function for details.

Packaging

If you would like to create a proper language support package, you should only include the "treetag" and "kRp.POS.tags" calls, and the hyphenation patterns should be loaded as a dependency to a package called sylly.xx. You can generate such a sylly package rather quickly by using the private function `sylly:::sylly_langpack()`.

Examples

```r
hyph_pat_yxz <- sylly::kRp_hyph_pat(
  lang = "xy",
  pattern = matrix(
    c(
      ".im5b", ".in1", ".in3d",
      ".imb", ".in", ".ind",
      "0050", "001", "0030"
    ),
    nrow=3,
    dimnames= list(
      NULL,
      c("orig", "char", "nums")
    )
  ),
)
set.lang.support(
  target="hyphen",
  value=list("xyz"=hyph_pat_yxz)
)
```

---

**show.kRp.lang-method**  
*Show methods for koRpus objects*

**Description**

Show methods for S4 objects of classes `kRp.lang`, `kRp.readability`, `kRp.corp.freq` or `kRp.TTR`.

**Usage**

```r
## S4 method for signature 'kRp.lang'
show(object)

## S4 method for signature 'kRp.TTR'
show(object)
```
## SMOG

Readability: Simple Measure of Gobbledygook (SMOG)

**Description**

This is just a convenient wrapper function for `readability`.

**Usage**

```r
SMOG(
  txt.file,
  hyphen = NULL,
  parameters = c(syll = 3, sqrt = 1.043, fact = 30, const = 3.1291, sqrt.const = 0),
  ...)
```

### Arguments

- **object**
  - An object of class `kRp.lang`, `kRp.readability`, `kRp.corp.freq`, or `kRp.TTR`.

### See Also

- `kRp.lang`, `kRp.readability`, `kRp.corp.freq`, `kRp.TTR`

### Examples

```r
## Not run:
guess.lang("/home/user/data/some.txt", udhr.path="/home/user/data/udhr_txt/")

## End(Not run)
## Not run:
MTLD(tagged.txt)

## End(Not run)
## Not run:
flesch(tagged.txt)

## End(Not run)
```
Arguments

**txt.file**
Either an object of class `kRp.text`, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.

**hyphen**
An object of class `kRp.hyphen`. If `NULL`, the text will be hyphenated automatically.

**parameters**
A numeric vector with named magic numbers, defining the relevant parameters for the index.

... Further valid options for the main function, see `readability` for details.

Details

This function calculates the Simple Measure of Gobbledygook (SMOG). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

By default calculates formula D by McLaughlin (1969). If `parameters` is set to `SMOG="C"`, formula C will be calculated. If `parameters` is set to `SMOG="simple"`, the simplified formula is used, and if `parameters="de"`, the formula adapted to German texts ("Qu", Bamberger & Vanecek, 1984, p. 78).

Value

An object of class `kRp.readability`.

References

Examples

```r
## Not run:
SMOG(tagged.text)
## End(Not run)
```

Description

This is just a convenient wrapper function for `readability`.
Usage

```
spache(
  txt.file,
  word.list,
  parameters = c(asl = 0.121, dword = 0.082, const = 0.659),
  ...
)
```

Arguments

- `txt.file`: Either an object of class `kRp.text`, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by `readability.num`.
- `word.list`: A vector or matrix (with exactly one column) which defines familiar words. For valid results the short Dale-Chall list with 769 easy words should be used.
- `parameters`: A numeric vector with named magic numbers, defining the relevant parameters for the index.
- `...`: Further valid options for the main function, see `readability` for details.

Details

Calculates the Spache Formula. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

By default the revised Spache formula is calculated. If `parameters"old"`, the original parameters are used.

This formula doesn’t need syllable count.

Value

An object of class `kRp.readability`.

Examples

```r
## Not run:
spache(tagged.text, word.list=spache.revised.wl)
```

```r
## End(Not run)
```

---

`split_by_doc_id`  
**Turn a multi-document kRp.text object into a list of kRp.text objects**

Description

For some analysis steps it might be important to have individual tagged texts instead of one large corpus object. This method produces just that.
usage

split_by_doc_id(obj, keepFeatures = TRUE)

## S4 method for signature 'kRp.text'
split_by_doc_id(obj, keepFeatures = TRUE)

Arguments

obj An object of class kRp.text.

keepFeatures Either logical, whether to keep all features or drop them, or a character vector of names of features to keep if present.

Value

A named list of objects of class kRp.text. Elements are named by their doc_id.

Examples

## Not run:
myCorpusList <- split_by_doc_id(myCorpus)

## End(Not run)

---

strain Readability: Strain Index

Description

This is just a convenient wrapper function for readability.

Usage

strain(txt.file, hyphen = NULL, parameters = c(sent = 3, const = 10), ...)

Arguments

txt.file Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.

hyphen An object of class kRp.hyphen. If NULL, the text will be hyphenated automatically.

parameters A numeric vector with named magic numbers, defining the relevant parameters for the index.

... Further valid options for the main function, see readability for details.
Details

This function calculates the Strain index. In contrast to readability, which by default calculates all possible indices, this function will only calculate the index value.

Value

An object of class kRp.readability.

Examples

```r
## Not run:
strain(tagged.text)
## End(Not run)
```

Summary methods for koRpus objects

Description

Summary method for S4 objects of classes kRp.lang, kRp.readability, kRp.text, or kRp.TTR.

Usage

```r
summary(object, ...)
```

Arguments

- **object** An object of class kRp.lang, kRp.readability, kRp.text, or kRp.TTR.
- **...** Further options, depending on the object class.
- **flat** Logical, if TRUE and feature = "lex_div" or "readability", a named vector of main results is returned. For objects containing more than one doc_id, defaults to TRUE automatically and returns a data frame with named rows.
index

Either a vector indicating which rows should be considered as transformed for
the statistics, or the name of a particular transformation that was previously done
to the object, if more than one transformation was applied. If NA, all rows where
"equal" is FALSE are used. Only valid for objects providing a diff feature.

feature

A character string naming a feature present in the object, to trigger a summary
regarding that feature. Currently only "freq", "lex_div", and "readability"
are implemented.

See Also

)
taggedText

**Description**

These methods should be used to get or set values of tagged text objects generated by koRpus functions like `treetag` or `tokenize`.

**Usage**

```r
taggedText(obj, add.desc = FALSE, doc_id = FALSE)
```

```r
## S4 method for signature 'kRp.text'
taggedText(obj, add.desc = FALSE, doc_id = FALSE)
```

## S4 method for signature 'kR.pp.txt.trans'
fixObject(obj, doc_id = NA)

## S4 method for signature 'kR.pp.analysis'
fixObject(obj, doc_id = NA)

Arguments

obj                    An arbitrary R object.
add.desc               Logical, determines whether the desc column should be re-written with descriptions for all POS tags.

Logical (except for fixObject, feature, and [/[[]<], if TRUE the doc_id column will be a factor with the respective value of the desc slot, i.e., the document ID will be preserved in the data.frame. If used with fixObject, can be a character string to set the document ID manually (the default NA will preserve existing values and not overwrite them). If used with feature or [/[[]<, a character vector to limit the scope to one or more particular document IDs.

value                  The new value to replace the current with.

...                    Additional arguments for the generics.

has_id                 A character vector with doc_ids to look for in the object. The return value is
then a logical vector of the same length, indicating if the respective id was found or not.

**feature**
Character string naming the feature to look for. The return value is logical if a single feature name is given. If `feature=NULL`, a character vector is returned, naming all features found in the object.

**x**
An object of class `kRp.text` or `kRp.hyphen`.

**i**
Defines the row selector (`[]`) or the name to match (`[[`).

**j**
Defines the column selector.

**drop**
Logical, whether the result should be coerced to the lowest possible dimension. See `[]` for more details.

**simplify**
Logical, if `TRUE` and the result is a list of length one (i.e., just a single `doc_id`), returns the contents of the single list entry.

**tokens**
An object of class `kRp.text`.

**Details**

- `taggedText()` returns the tokens slot.
- `doc_id()` returns a character vector of all `doc_id` values in the object.
- `describe()` returns the `desc` slot.
- `language()` returns the `lang` slot.
- `[]` Can be used as a shortcut to index the results of `taggedText()`.
- `fixObject` returns the same object upgraded to the object structure of this package version (e.g., new columns, changed names, etc.).
- `hasFeature()` returns `TRUE` or `FALSE`, depending on whether the requested feature is present or not.
- `feature()` returns the list entry of the `feat_list` slot for the requested feature.
- `corpusReadability()` returns the list of `kRp.readability` objects, see `readability`.
- `corpusHyphen()` returns the list of `kRp.hyphen` objects, see `hyphen`.
- `corpusLexDiv()` returns the list of `kRp.TTR` objects, see `lex.div`.
- `corpusFreq()` returns the frequency analysis data from the `feat_list` slot, see `freq.analysis`.
- `corpusCorpFreq()` returns the `kRp.corp.freq` object of the `feat_list` slot, see for example `read.corp.custom`.
- `corpusStopwords()` returns the number of stopwords found in each text (if analyzed) from the `feat_list` slot.
- `tif_as_tokens_df` returns the tokens slot in a TIF[1] compliant format, i.e., `doc_id` is not a factor but a character vector.
- `originalText()` similar to `taggedText()`, but reverts any transformations back to the original text before returning the tokens slot. Only works if the object has the feature `diff`, see examples.
- `diffText()` returns the `diff` slot, if present.
textFeatures

Extract text features for authorship analysis

Description

This function combines several of koRpus’ methods to extract the 9-Feature Set for authorship detection (Brannon, Afroz & Greenstadt, 2011; Brannon & Greenstadt, 2009).

Usage

textFeatures(text, hyphen = NULL)
Arguments

- **text**: An object of class `kRp.text`. Can also be a list of these objects, if you want to analyze more than one text at once.
- **hyphen**: An object of class `kRp.hyphen`, if text has already been hyphenated. If text is a list and hyphen is not NULL, it must also be a list with one object for each text, in the same order.

Value

A data.frame:

- **uniqWd**: Number of unique words (tokens)
- **cmplx**: Complexity (TTR)
- **sntCt**: Sentence count
- **sntLen**: Average sentence length
- **syllCt**: Average syllable count
- **charCt**: Character count (all characters, including spaces)
- **lttrCt**: Letter count (without spaces, punctuation and digits)
- **FOG**: Gunning FOG index
- **flesch**: Flesch Reading Ease index

References

Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  textFeatures(tokenized.obj)
} else {
}
```
Description
Transforms text in koRpus objects token by token.

Usage

textTransform(txt, ...)

## S4 method for signature 'kRp.text'
textTransform(
  txt,
  scheme,
  p = 0.5,
  paste = FALSE,
  var = "wclass",
  query = "fullstop",
  method = "replace",
  replacement = ".",
  f = NA,
  ...
)

Arguments

txt
An object of class kRp.text.

... Parameters passed to query to find matching tokens. Relevant only if scheme="normalize".

scheme One of the following character strings:

- "minor" Start each word with a lowercase letter.
- "all.minor" Forces all letters into lowercase.
- "major" Start each word with a uppercase letter.
- "all.major" Forces all letters into uppercase.
- "random" Randomly start words with uppercase or lowercase letters.
- "de.norm" German norm: All names, nouns and sentence beginnings start with an uppercase letter, anything else with a lowercase letter.
- "de.inv" Inversion of "de.norm".
- "eu.norm" Usual European cases: Only names and sentence beginnings start with an uppercase letter, anything else with a lowercase letter.
- "eu.inv" Inversion of "eu.norm".
- "normalize" Replace all tokens matching query in column var according to method (see below).

p Numeric value between 0 and 1. Defines the probability for upper case letters (relevant only if scheme="random").
paste Logical, see value section.

var A character string naming a variable in the object (i.e., colname). See query for details. Relevant only if scheme="normalize".

query A character vector (for words), regular expression, or single number naming values to be matched in the variable. See query for details. Relevant only if scheme="normalize".

method One of the following character strings:

- "shortest" Replace all matches with the shortest value found.
- "longest" Replace all matches with the longest value found.
- "replace" Replace all matches with the token given via replacement.
- "function" Replace all matches with the result of the function provided by f (see section Function for details).

In case of "shortest" and "longest", if multiple values of the same length are found, the (first) most prevalent one is being used. The actual replacement value is documented in the diff slot of the object, as a list called transfmt.normalize. Relevant only if scheme="normalize".

replacement Character string defining the exact token to replace all query matches with. Relevant only if scheme="normalize" and method="replace".

f A function to calculate the replacement for all query matches. Relevant only if scheme="normalize" and method="function".

Details

This method is mainly intended to produce text material for experiments.

Value

By default an object of class kRp.text with the added feature diff is returned. It provides a list with mostly atomic vectors, describing the amount of differences between both text variants (percentage):

all.tokens: Percentage of all tokens, including punctuation, that were altered.

words: Percentage of altered words only.

all.chars: Percentage of all characters, including punctuation, that were altered.

letters: Percentage of altered letters in words only.

transfmt: Character vector documenting the transformation(s) done to the tokens.

transfmt.equal: Data frame documenting which token was changed in which transformational step. Only available if more than one transformation was done.

transfmt.normalize: A list documenting steps of normalization that were done to the object, one element per transformation. Each entry holds the name of the method, the query parameters, and the effective replacement value.

If paste=TRUE, returns an atomic character vector (via pasteText).
Function

You can dynamically calculate the replacement value for the "normalize" scheme by setting `method="function"` and providing a function object as `f`. The function you provide must support the following arguments:

- `tokens` The original tokens slot of the `txt` object (see `taggedText`).
- `match` A logical vector, indicating for each row of `tokens` whether it’s a query match or not.

You can then use these arguments in your function body to calculate the replacement, e.g. `tokens[match, "token"]` to get all relevant tokens. The return value of the function will be used as the replacement for all matched tokens. You probably want to make sure it’s a character vector of length one or of the same length as all matches.

Examples

```r
# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(
    path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
  )
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en"
  )
  tokenized.obj <- textTransform(
    tokenized.obj,
    scheme="random"
  )
  pasteText(tokenized.obj)
  # diff stats are now part of the object
  hasFeature(tokenized.obj)
  diffText(tokenized.obj)
} else {};
```

Description

This tokenizer can be used to try replace TreeTagger. Its results are not as detailed when it comes to word classes, and no lemmatization is done. However, for most cases this should suffice.

Usage

```r
tokenize(
  txt,
  format = "file",
  fileEncoding = NULL,
)```
split = "\[:space:]]\",
ign.comp = "-",
heuristics = "abbr",
heur.fix = list(pre = c("\u2019", ""), suf = c("\u2019", ")),
abbrev = NULL,
tag = TRUE,
lang = "kRp.env",
sentc.end = c("." , "!", ",", ",", ":"),
detect = c(parag = FALSE, hline = FALSE),
clean.raw = NULL,
perl = FALSE,
stopwords = NULL,
stemmer = NULL,
doc_id = NA,
add.desc = "kRp.env",
...)

## S4 method for signature 'character'
tokenize(
txt,
format = "file",
fileEncoding = NULL,
split = "\[:space:]]",
ign.comp = "-",
heuristics = "abbr",
heur.fix = list(pre = c("\u2019", ""), suf = c("\u2019", "")),
abbrev = NULL,
tag = TRUE,
lang = "kRp.env",
sentc.end = c("." , "!", ",", ",", ":"),
detect = c(parag = FALSE, hline = FALSE),
clean.raw = NULL,
perl = FALSE,
stopwords = NULL,
stemmer = NULL,
doc_id = NA,
add.desc = "kRp.env"
)

## S4 method for signature 'kRp.connection'
tokenize(
txt,
format = NA,
fileEncoding = NULL,
split = "\[:space:]]",
ign.comp = "-",
heuristics = "abbr",
...
heur.fix = list(pre = c("\u2019", ""), suf = c("\u2019", "")),
abbrev = NULL,
tag = TRUE,
lang = "kRp.env",
sentc.end = c(".", "!", "?", ",", ":"),
detect = c(parag = FALSE, hline = FALSE),
clean.raw = NULL,
perl = FALSE,
stopwords = NULL,
stemmer = NULL,
doc_id = NA,
add.desc = "kRp.env"
)

Arguments

txt Either an open connection, the path to directory with txt files to read and tokenize, or a vector object already holding the text corpus.

format Either "file" or "obj", depending on whether you want to scan files or analyze the given object. Ignored if txt is a connection.

fileEncoding A character string naming the encoding of all files.

split A regular expression to define the basic split method. Should only need refinement for languages that don’t separate words by space.

ign.comp A character vector defining punctuation which might be used in composita that should not be split.

heuristics A vector to indicate if the tokenizer should use some heuristics. Can be none, one or several of the following:

- "abbr" Assume that "letter-dot-letter-dot" combinations are abbreviations and leave them intact.
- "suf" Try to detect possessive suffixes like "'s", or shorting suffixes like "'ll" and treat them as one token
- "pre" Try to detect prefixes like "s'" or "l'" and treat them as one token

Earlier releases used the names "en" and "fr" instead of "suf" and "pre". They are still working, that is "en" is equivalent to "suf", whereas "fr" is now equivalent to both "suf" and "pre" (and not only "pre" as in the past, which was missing the use of suffixes in French).

heur.fix A list with the named vectors pre and suf. These will be used if heuristics were set to use one of the presets that try to detect pre- and/or suffixes. Change them if you document uses other characters than the ones defined by default.

abbrev Path to a text file with abbreviations to take care of, one per line. Note that this file must have the same encoding as defined by fileEncoding.

tag Logical. If TRUE, the text will be rudimentarily tagged and returned as an object of class kRp.text.

lang A character string naming the language of the analyzed text. If set to "kRp.env" this is fetched from get.kRp.env. Only needed if tag=TRUE.
tokenize

sentc.end A character vector with tokens indicating a sentence ending. Only needed if tag=TRUE.

detect A named logical vector, indicating by the setting of parag and hline whether tokenize should try to detect paragraphs and headlines.

clean.raw A named list of character values, indicating replacements that should globally be made to the text prior to tokenizing it. This is applied after the text was converted into UTF-8 internally. In the list, the name of each element represents a pattern which is replaced by its value if met in the text. Since this is done by calling gsub, regular expressions are basically supported. See the perl attribute, too.

perl Logical, only relevant if clean.raw is not NULL. If perl=TRUE, this is forwarded to gsub to allow for perl-like regular expressions in clean.raw.

stopwords A character vector to be used for stopword detection. Comparison is done in lower case. You can also simply set stopwords=tm::stopwords("en") to use the english stopwords provided by the tm package.

stemmer A function or method to perform stemming. For instance, you can set SnowballC::wordStem if you have the SnowballC package installed. As of now, you cannot provide further arguments to this function.

doc_id Character string, optional identifier of the particular document. Will be added to the desc slot, and as a factor to the "doc_id" column of the tokens slot. If NA, the document name will be used (for format="obj" a random name).

add.desc Logical. If TRUE, the tag description (column "desc" of the data.frame) will be added directly to the resulting object. If set to "kRp.env" this is fetched from get.kRp.env. Only needed if tag=TRUE.

Value

If tag=FALSE, a character vector with the tokenized text. If tag=TRUE, returns an object of class kRp.text.

Examples

# code is only run when the english language package can be loaded
if(require("koRpus.lang.en", quietly = TRUE)){
  sample_file <- file.path(path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
tokenized.obj <- tokenize(
  txt=sample_file,
  lang="en"
)

## character manipulation
# this is useful if you know of problematic characters in your
# raw text files, but don't want to touch them directly. you
# don't have to, as you can substitute them, even using regular
# expressions. a simple example: replace all single quotes by
# double quotes throughout the text:
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en",
    clean.raw=list(""=""")
  )

# now replace all occurrences of the letter A followed
# by two digits with the letter B, followed by the same
# two digits:
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en",
    clean.raw=list("\A([[:digit:]][2])"="B\2"),
    perl=TRUE
  )

## enabling stopword detection and stemming
if(all(
  requireNamespace("tm", quietly=TRUE),
  requireNamespace("SnowballC", quietly=TRUE)
)) {
  # if you also installed the packages tm and Snowball,
  # you can use some of their features with koRpus:
  tokenized.obj <- tokenize(
    txt=sample_file,
    lang="en",
    stopwords=tm::stopwords("en"),
    stemmer=SnowballC::wordStem
  )

  # removing all stopwords now is simple:
  tokenized.noStopWords <- filterByClass(tokenized.obj, "stopword")
} else { }
} else { }
Description

This is just a convenient wrapper function for readability.

Usage

traenkle.bailer(
  txt.file,
  TB1 = c(const = 224.6814, awl = 79.8304, asl = 12.24032, prep = 1.292857),
  TB2 = c(const = 234.1063, awl = 96.11069, prep = 2.05444, conj = 1.02805),
  ...
)

Arguments

txt.file Either an object of class kRp.text, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by readability.num.

TB1 A numeric vector with named magic numbers for the first of the formulas.

TB2 A numeric vector with named magic numbers for the second of the formulas.

... Further valid options for the main function, see readability for details.

Details

This function calculates the two formulae by Traenkle-Bailer, which are based on the Dickes-Steiwer formulae. In contrast to readability, which by default calculates all possible indices, this function will only calculate the index values.

This formula doesn’t need syllable count.

Value

An object of class kRp.readability.

Examples

## Not run:
traenkle.bailer(tagged.text)

## End(Not run)
A method to call TreeTagger

Description

This method calls a local installation of TreeTagger[1] to tokenize and POS tag the given text.

Usage

```r
treetag(
  file,
  treetagger = "kRp.env",
  rm.sgml = TRUE,
  lang = "kRp.env",
  apply.sentc.end = TRUE,
  sentc.end = c("." , "!" , "?" , ":" , ":" ),
  encoding = NULL,
  TT.options = NULL,
  debug = FALSE,
  TT.tknz = TRUE,
  format = "file",
  stopwords = NULL,
  stemmer = NULL,
  doc_id = NA,
  add.desc = "kRp.env",
  ...
)
```

```r
## S4 method for signature 'character'

```r
treetag(
  file,
  treetagger = "kRp.env",
  rm.sgml = TRUE,
  lang = "kRp.env",
  apply.sentc.end = TRUE,
  sentc.end = c("." , "!" , "?" , ":" , ":" ),
  encoding = NULL,
  TT.options = NULL,
  debug = FALSE,
  TT.tknz = TRUE,
  format = "file",
  stopwords = NULL,
  stemmer = NULL,
  doc_id = NA,
  add.desc = "kRp.env"
)
```
## S4 method for signature 'kRp.connection'
treetag(
  file,
  treetagger = "kRp.env",
  rm.sgml = TRUE,
  lang = "kRp.env",
  apply.sentc.end = TRUE,
  sentc.end = c(".", "!", "?", ";", ":"),
  encoding = NULL,
  TT.options = NULL,
  debug = FALSE,
  TT.tknz = TRUE,
  format = NA,
  stopwords = NULL,
  stemmer = NULL,
  doc_id = NA,
  add.desc = "kRp.env"
)

### Arguments

**file**  
Either a connection or a character vector, valid path to a file, containing the text to be analyzed. If file is a connection, its contents will be written to a temporary file, since TreeTagger can't read from R connection objects.

**treetagger**  
A character vector giving the TreeTagger script to be called. If set to "kRp.env" this is got from get.kRp.env. Only if set to "manual", it is assumend not to be a wrapper script that can work the given text file, but that you would like to manually tweak options for tokenizing and POS tagging yourself. In that case, you need to provide a full set of options with the TT.options parameter.

**rm.sgml**  
Logical, whether SGML tags should be ignored and removed from output.

**lang**  
A character string naming the language of the analyzed corpus. See kRp.POS.tags and available.koRpus.lang for all supported languages. If set to "kRp.env" this is fetched from get.kRp.env.

**apply.sentc.end**  
Logical, whether the tokens defined in sentc.end should be searched and set to a sentence ending tag.

**sentc.end**  
A character vector with tokens indicating a sentence ending. This adds to TreeTaggers results, it doesn’t really replace them.

**encoding**  
A character string defining the character encoding of the input file, like "Latin1" or "UTF-8". If NULL, the encoding will either be taken from a preset (if defined in TT.options), or fall back to "". Hence you can overwrite the preset encoding with this parameter.

**TT.options**  
A list of options to configure how TreeTagger is called. You have two basic choices: Either you choose one of the pre-defined presets or you give a full set of valid options:

* path Mandatory: The absolute path to the TreeTagger root directory. That is where its subfolders bin, cmd and lib are located.
• preset Optional: If you choose one of the pre-defined presets of one of the available language packages (like "de" for German, see available.koRpus.lang for details), you can omit all the following elements, because they will be filled with defaults. Of course this only makes sense if you have a working default installation. Note that since koRpus 0.07-1, UTF-8 is the global default encoding.

• tokenizer Mandatory: A character string, naming the tokenizer to be called. Interpreted relative to path/cmd/.

• tknz.opts Optional: A character string with the options to hand over to the tokenizer. You don’t need to specify "-a" if abbrev is given. If TT.tknz=FALSE, you can pass configurational options to tokenize by providing them as a named list (instead of a character string) here.

• pre.tagger Optional: A character string with code to be run before the tagger. This code is used as-is, so you need make sure it includes the needed pipe symbols.

• tagger Mandatory: A character string, naming the tagger-command to be called. Interpreted relative to path/bin/.

• abbrev Optional: A character string, naming the abbreviation list to be used. Interpreted relative to path/lib/.

• params Mandatory: A character string, naming the parameter file to be used. Interpreted relative to path/lib/.

• lexicon Optional: A character string, naming the lexicon file to be used. Interpreted relative to path/lib/.

• lookup Optional: A character string, naming the lexicon lookup command. Interpreted relative to path/cmd/.

• filter Optional: A character string, naming the output filter to be used. Interpreted relative to path/cmd/.

• no.unknown Optional: Logical, can be used to toggle the "-no-unknown" option of TreeTagger (defaults to FALSE).

• splitter Optional: A character string, naming the splitter to be called (before the tokenizer). Interpreted relative to path/cmd/.

• splitter.opts Optional: A character string with the options to hand over to the splitter.

You can also set these options globally using set.kRp.env, and then force treetag to use them by setting TT.options="kRp.env" here. Note: If you use the treetagger setting from kRpus.env and it's set to TT.cmd="manual", treetag will treat TT.options=NULL like TT.options="kRpus.env" automatically.

debug Logical. Especially in cases where the presets wouldn’t work as expected, this switch can be used to examine the values treetag is assuming.

TT.tknz Logical, if FALSE TreeTagger’s tokenizer script will be replaced by koRpus’ function tokenize. To accomplish this, its results will be written to a temporal file which is automatically deleted afterwards (if debug=FALSE). Note that this option only has an effect if treetagger="manual".

format Either "file" or "obj", depending on whether you want to scan files or analyze the text in a given object, like a character vector. If the latter, it will be written to a temporary file (see file).
stopwords A character vector to be used for stopword detection. Comparison is done in lower case. You can also simply set stopwords=tm::stopwords("en") to use the english stopwords provided by the tm package.

stemmer A function or method to perform stemming. For instance, you can set SnowballC::wordStem if you have the SnowballC package installed. As of now, you cannot provide further arguments to this function.

doc_id Character string, optional identifier of the particular document. Will be added to the desc slot, and as a factor to the "doc_id" column of the tokens slot. If NA, the document name will be used (for format="obj" a random name).

add.desc Logical. If TRUE, the tag description (column "desc" of the data.frame) will be added directly to the resulting object. If set to "kRp.env" this is fetched from get.kRp.env.

... Only used for the method generic.

details Note that the value of lang must match a valid language supported by kRp.POS.tags. It will also get stored in the resulting object and might be used by other functions at a later point. E.g., treetag is being called by freq.analysis, which will by default query this language definition, unless explicitly told otherwise. The rationale behind this is to comfortably make it possible to have tokenized and POS tagged objects of various languages around in your workspace, and not worry about that too much.

value An object of class kRp.text. If debug=TRUE, prints internal variable settings and attempts to return the original output if the TreeTagger system call in a matrix.

Author(s) m.eik michalke <meik.michalke@hhu.de>, support for various laguages was contributed by Earl Brown (Spanish), Alberto Mirisola (Italian) and Alexandre Brulet (French).

[1] https://www.cis.lmu.de/~schmid/tools/TreeTagger/

See Also freq.analysis, get.kRp.env, kRp.text

Examples

sample_file <- file.path(
  path.package("koRpus"), "examples", "corpus", "Reality_Winner.txt"
)
## Not run:
# first way to invoke POS tagging, using a built-in preset:
tagged.results <- treetag(
sample_file,
treetagger="manual",
lang="en",
TT.options=list(
    path=file.path("~", "bin", "treetagger"),
    preset="en"
)
)

# second way, use one of the batch scripts that come with TreeTagger:
tagged.results <- treetag(
sample_file,
treetagger=file.path("~", "bin", "treetagger", "cmd", "tree-tagger-english"),
lang="en"
)

# third option, set the above batch script in an environment object first:
set.kRp.env(
    TT.cmd=file.path("~", "bin", "treetagger", "cmd", "tree-tagger-english"),
    lang="en"
)
tagged.results <- treetag(
sample_file
)

# after tagging, use the resulting object with other functions in this package:
readability(tagged.results)
lex.div(tagged.results)

## enabling stopword detection and stemming
# if you also installed the packages tm and SnowballC,
# you can use some of their features with koRpus:
set.kRp.env(
    TT.cmd="manual",
    lang="en",
    TT.options=list(
        path=file.path("~", "bin", "treetagger"),
        preset="en"
    )
)
tagged.results <- treetag(
sample_file,
stopwords=tm::stopwords("en"),
stemmer=SnowballC::wordStem
)

# removing all stopwords now is simple:
tagged.noStopWords <- filterByClass(
tagged.results,
    "stopword"
)

## End(Not run)
TRI  Readability: Kuntzsch’s Text-Redundanz-Index

Description
This is just a convenient wrapper function for `readability`.

Usage

```
TRI(
  txt.file,
  hyphen = NULL,
  parameters = c(syll = 1, word = 0.449, pnc = 2.467, frgn = 0.937, const = 14.417),
  ...
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txt.file</td>
<td>Either an object of class <code>kRp.text</code>, a character vector which must be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by <code>readability.num</code>.</td>
</tr>
<tr>
<td>hyphen</td>
<td>An object of class <code>kRp.hyphen</code>. If <code>NULL</code>, the text will be hyphenated automatically.</td>
</tr>
<tr>
<td>parameters</td>
<td>A numeric vector with named magic numbers, defining the relevant parameters for the index.</td>
</tr>
<tr>
<td>...</td>
<td>Further valid options for the main function, see <code>readability</code> for details.</td>
</tr>
</tbody>
</table>

Details
This function calculates Kuntzsch’s Text-Redundanz-Index (text redundancy index). In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

Value
An object of class `kRp.readability`.

Examples

```r
## Not run:
TRI(tagged.text)
## End(Not run)
```
Description

This is just a convenient wrapper function for \texttt{lex.div}.

Usage

\texttt{TTR(txt, char = FALSE, \ldots)}

Arguments

\begin{itemize}
\item \texttt{txt} \hspace{1cm} An object of class \texttt{krp.text} containing the tagged text to be analyzed.
\item \texttt{char} \hspace{1cm} Logical, defining whether data for plotting characteristic curves should be calculated.
\item \ldots \hspace{1cm} Further valid options for the main function, see \texttt{lex.div} for details.
\end{itemize}

Details

This function calculates the classic type-token ratio (TTR). In contrast to \texttt{lex.div}, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the TTR value, and characteristics are off by default.

Value

An object of class \texttt{krp.TTR}.

See Also

\texttt{krp.POS.tags, krp.text, krp.TTR}

Examples

\begin{verbatim}
## Not run:
TTR(tagged.text)

## End(Not run)
\end{verbatim}
**tuldava**  
*Readability: Tuldava's Text Difficulty Formula*

**Description**

This is just a convenient wrapper function for `readability`.

**Usage**

```r
## Not run:
tuldava(tagged.text)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>txt.file</code></td>
<td>Either an object of class <code>kRp.text</code>, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by <code>readability.num</code>.</td>
</tr>
<tr>
<td><code>hyphen</code></td>
<td>An object of class <code>kRp.hyphen</code>. If <code>NULL</code>, the text will be hyphenated automatically.</td>
</tr>
<tr>
<td><code>parameters</code></td>
<td>A numeric vector with named magic numbers, defining the relevant parameters for the index.</td>
</tr>
<tr>
<td>...</td>
<td>Further valid options for the main function, see <code>readability</code> for details.</td>
</tr>
</tbody>
</table>

**Details**

This function calculates Tuldava’s Text Difficulty Formula. In contrast to `readability`, which by default calculates all possible indices, this function will only calculate the index value.

**Value**

An object of class `kRp.readability`.

**Note**

This index originally has no parameter weights. To be able the use weights anyway, each parameter of the formula is available and its weight set to 1 by default.

**Examples**

```r
## Not run:
tuldava(tagged.text)
## End(Not run)
```
Description

These methods return character vectors that return all types or tokens of a given text, where text can either be a character vector itself, a previously tokenized/tagged koRpus object, or an object of class kRp.TTR.

Usage

```r

types(txt, ...)

tokens(txt, ...)

## S4 method for signature 'kRp.TTR'
types(txt, stats = FALSE)

## S4 method for signature 'kRp.TTR'
tokens(txt)

## S4 method for signature 'kRp.text'
types(
  txt,
  case.sens = FALSE,
  lemmatize = FALSE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c(),
  stats = FALSE
)

## S4 method for signature 'kRp.text'
tokens(
  txt,
  case.sens = FALSE,
  lemmatize = FALSE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c()
)

## S4 method for signature 'character'
types(
  txt,
  case.sens = FALSE,
  lemmatize = FALSE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c(),
)```
stats = FALSE,
lang = NULL
)

## S4 method for signature 'character'
tokens(
  txt,
  case.sens = FALSE,
  lemmatize = FALSE,
  corp.rm.class = "nonpunct",
  corp.rm.tag = c(),
  lang = NULL
)

Arguments

txt       An object of either class \texttt{kRp.text} or \texttt{kRp.TTR}, or a character vector.
...	     Only used for the method generic.
stats    Logical, whether statistics on the length in characters and frequency of types in
          the text should also be returned.
case.sens Logical, whether types should be counted case sensitive. This option is available
            for tagged text and character input only.
lemmatize Logical, whether analysis should be carried out on the lemmatized tokens rather
            than all running word forms. This option is available for tagged text and char-
            acter input only.
corp.rm.class A character vector with word classes which should be dropped. The default
            value "nonpunct" has special meaning and will cause the result of \texttt{kRp.POS.tags(lang,
            tags=c("punct","sentc"), list.classes=TRUE)} to be used. This option is
            available for tagged text and character input only.
corp.rm.tag  A character vector with POS tags which should be dropped. This option is
            available for tagged text and character input only.
lang   Set the language of a text, see the \texttt{force.lang} option of \texttt{lex.div}. This option
            is available for character input only.

Value

A character vector. For types and stats=TRUE a data.frame containing all types, their length (char-
acters) and frequency. The types result is always sorted by frequency, with more frequent types
coming first.

Note

If the input is of class \texttt{kRp.TTR}, the result will only be useful if \texttt{lex.div} or the respective wrapper
function was called with keep.tokens=TRUE. Similarly, lemmatize can only work properly
if the input is a tagged text object with lemmata or you’ve properly set up the enviroment via
\texttt{set.kRp.env}. Calling these methods on \texttt{kRp.TTR} objects is just returning the respective part of its
\texttt{tt} slot.
**U.ld**

Lexical diversity: Uber Index (U)

### Description

This is just a convenient wrapper function for `lex.div`.

### Usage

```r
U.ld(txt, char = FALSE, ...)
```

### Arguments

- **txt**
  - An object of class `kRp.text` containing the tagged text to be analyzed.

- **char**
  - Logical, defining whether data for plotting characteristic curves should be calculated.

- **...**
  - Further valid options for the main function, see `lex.div` for details.

### Details

This function calculates the Uber Index (U). In contrast to `lex.div`, which by default calculates all possible measures and their progressing characteristics, this function will only calculate the U value, and characteristics are off by default.

### Value

An object of class `kRp.TTR`.

---

**See Also**

- `kRp.POS.tags`
- `kRp.text`
- `kRp.TTR`
- `lex.div`
See Also

kRp.POS.tags, kRp.text, kRp.TTR

Examples

## Not run:
U.ld(tagged.text)

## End(Not run)

---

wheeler.smith Readability: Wheeler-Smith Score

Description

This is just a convenient wrapper function for \texttt{readability}.

Usage

wheeler.smith(txt.file, hyphen = NULL, parameters = c(syll = 2), ...)

Arguments

- \texttt{txt.file} Either an object of class \texttt{kRp.text}, a character vector which must be be a valid path to a file containing the text to be analyzed, or a list of text features. If the latter, calculation is done by \texttt{readability.num}.
- \texttt{hyphen} An object of class \texttt{kRp.hyphen}. If \texttt{NULL}, the text will be hyphenated automatically.
- \texttt{parameters} A numeric vector with named magic numbers, defining the relevant parameters for the index.
- \texttt{...} Further valid options for the main function, see \texttt{readability} for details.

Details

This function calculates the Wheeler-Smith Score. In contrast to \texttt{readability}, which by default calculates all possible indices, this function will only calculate the index value.

If \texttt{parameters="de"}, the calculation stays the same, but grade placement is done according to Bamberger & Venček (1984), that is for german texts.

Value

An object of class \texttt{kRp.readability}. 
References

Examples

```r
## Not run:
wheeler.smith(tagged.text)

## End(Not run)
