

Package ‘paws.security.identity’

February 8, 2023

Title 'Amazon Web Services' Security, Identity, & Compliance Services

Version 0.2.0

Description Interface to 'Amazon Web Services' security, identity, and compliance services, including the 'Identity & Access Management' (IAM) service for managing access to services and resources, and more <<https://aws.amazon.com/>>.

License Apache License (>= 2.0)

URL <https://github.com/paws-r/paws>

BugReports <https://github.com/paws-r/paws/issues>

Imports paws.common (>= 0.5.4)

Suggests testthat

accessanalyzer	<i>Access Analyzer</i>
----------------	------------------------

Description

Identity and Access Management Access Analyzer helps identify potential resource-access risks by enabling you to identify any policies that grant access to an external principal. It does this by using logic-based reasoning to analyze resource-based policies in your Amazon Web Services environment. An external principal can be another Amazon Web Services account, a root user, an IAM user or role, a federated user, an Amazon Web Services service, or an anonymous user. You can also use IAM Access Analyzer to preview and validate public and cross-account access to your resources before deploying permissions changes. This guide describes the Identity and Access Management Access Analyzer operations that you can call programmatically. For general information about IAM Access Analyzer, see [Identity and Access Management Access Analyzer](#) in the **IAM User Guide**.

To start using IAM Access Analyzer, you first need to create an analyzer.

Usage

```
accessanalyzer(config = list())
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- accessanalyzer(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[apply_archive_rule](#)

Retroactively applies the archive rule to existing findings that meet the archive rule criteria

cancel_policy_generation	Cancels the requested policy generation
create_access_preview	Creates an access preview that allows you to preview IAM Access Analyzer findings for your
create_analyzer	Creates an analyzer for your account
create_archive_rule	Creates an archive rule for the specified analyzer
delete_analyzer	Deletes the specified analyzer
delete_archive_rule	Deletes the specified archive rule
get_access_preview	Retrieves information about an access preview for the specified analyzer
get_analyzed_resource	Retrieves information about a resource that was analyzed
get_analyzer	Retrieves information about the specified analyzer
get_archive_rule	Retrieves information about an archive rule
get_finding	Retrieves information about the specified finding
get_generated_policy	Retrieves the policy that was generated using StartPolicyGeneration
list_access_preview_findings	Retrieves a list of access preview findings generated by the specified access preview
list_access_previews	Retrieves a list of access previews for the specified analyzer
list_analyzed_resources	Retrieves a list of resources of the specified type that have been analyzed by the specified anal
list_analyzers	Retrieves a list of analyzers
list_archive_rules	Retrieves a list of archive rules created for the specified analyzer
list_findings	Retrieves a list of findings generated by the specified analyzer
list_policy_generations	Lists all of the policy generations requested in the last seven days
list_tags_for_resource	Retrieves a list of tags applied to the specified resource
start_policy_generation	Starts the policy generation request
start_resource_scan	Immediately starts a scan of the policies applied to the specified resource
tag_resource	Adds a tag to the specified resource
untag_resource	Removes a tag from the specified resource
update_archive_rule	Updates the criteria and values for the specified archive rule
update_findings	Updates the status for the specified findings
validate_policy	Requests the validation of a policy and returns a list of findings

Examples

```
## Not run:
svc <- accessanalyzer()
svc$apply_archive_rule(
  Foo = 123
)

## End(Not run)
```

account

AWS Account

Description

Operations for Amazon Web Services Account Management

Usage

```
account(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- **region**: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- account(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

delete_alternate_contact	Deletes the specified alternate contact from an Amazon Web Services account
get_alternate_contact	Retrieves the specified alternate contact attached to an Amazon Web Services account
get_contact_information	Retrieves the primary contact information of an Amazon Web Services account
put_alternate_contact	Modifies the specified alternate contact attached to an Amazon Web Services account
put_contact_information	Updates the primary contact information of an Amazon Web Services account

Examples

```
## Not run:
svc <- account()
svc$delete_alternate_contact(
  Foo = 123
)

## End(Not run)
```

 acm

AWS Certificate Manager

Description

Amazon Web Services Certificate Manager

You can use Amazon Web Services Certificate Manager (ACM) to manage SSL/TLS certificates for your Amazon Web Services-based websites and applications. For more information about using ACM, see the [Amazon Web Services Certificate Manager User Guide](#).

Usage

```
acm(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client.
--------	---

- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- acm(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

add_tags_to_certificate	Adds one or more tags to an ACM certificate
delete_certificate	Deletes a certificate and its associated private key
describe_certificate	Returns detailed metadata about the specified ACM certificate
export_certificate	Exports a private certificate issued by a private certificate authority (CA) for use anywhere
get_account_configuration	Returns the account configuration options associated with an Amazon Web Services account
get_certificate	Retrieves an Amazon-issued certificate and its certificate chain
import_certificate	Imports a certificate into Amazon Web Services Certificate Manager (ACM) to use with services
list_certificates	Retrieves a list of certificate ARNs and domain names
list_tags_for_certificate	Lists the tags that have been applied to the ACM certificate
put_account_configuration	Adds or modifies account-level configurations in ACM
remove_tags_from_certificate	Remove one or more tags from an ACM certificate
renew_certificate	Renews an eligible ACM certificate
request_certificate	Requests an ACM certificate for use with other Amazon Web Services services

resend_validation_email	Resends the email that requests domain ownership validation
update_certificate_options	Updates a certificate

Examples

```
## Not run:
svc <- acm()
svc$add_tags_to_certificate(
  Foo = 123
)

## End(Not run)
```

acmpca

AWS Certificate Manager Private Certificate Authority

Description

This is the *Certificate Manager Private Certificate Authority (PCA) API Reference*. It provides descriptions, syntax, and usage examples for each of the actions and data types involved in creating and managing a private certificate authority (CA) for your organization.

The documentation for each action shows the API request parameters and the JSON response. Alternatively, you can use one of the Amazon Web Services SDKs to access an API that is tailored to the programming language or platform that you prefer. For more information, see [Amazon Web Services SDKs](#).

Each ACM Private CA API operation has a quota that determines the number of times the operation can be called per second. ACM Private CA throttles API requests at different rates depending on the operation. Throttling means that ACM Private CA rejects an otherwise valid request because the request exceeds the operation's quota for the number of requests per second. When a request is throttled, ACM Private CA returns a `ThrottlingException` error. ACM Private CA does not guarantee a minimum request rate for APIs.

To see an up-to-date list of your ACM Private CA quotas, or to request a quota increase, log into your Amazon Web Services account and visit the Service Quotas console.

Usage

```
acmpca(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- `access_key_id`: AWS access key ID
- `secret_access_key`: AWS secret access key

- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- **region**: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- acmpca(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

create_certificate_authority	Creates a root or subordinate private certificate authority (CA)
create_certificate_authority_audit_report	Creates an audit report that lists every time that your CA private key is used
create_permission	Grants one or more permissions on a private CA to the Certificate Manager (ACM)
delete_certificate_authority	Deletes a private certificate authority (CA)
delete_permission	Revokes permissions on a private CA granted to the Certificate Manager (ACM)
delete_policy	Deletes the resource-based policy attached to a private CA
describe_certificate_authority	Lists information about your private certificate authority (CA) or one that has been

<code>describe_certificate_authority_audit_report</code>	Lists information about a specific audit report created by calling the <code>CreateCertificateAuthorityAuditReport</code> API.
<code>get_certificate</code>	Retrieves a certificate from your private CA or one that has been shared with you.
<code>get_certificate_authority_certificate</code>	Retrieves the certificate and certificate chain for your private certificate authority.
<code>get_certificate_authority_csr</code>	Retrieves the certificate signing request (CSR) for your private certificate authority.
<code>get_policy</code>	Retrieves the resource-based policy attached to a private CA.
<code>import_certificate_authority_certificate</code>	Imports a signed private CA certificate into ACM Private CA.
<code>issue_certificate</code>	Uses your private certificate authority (CA), or one that has been shared with you, to issue a certificate.
<code>list_certificate_authorities</code>	Lists the private certificate authorities that you created by using the <code>CreateCertificateAuthority</code> API.
<code>list_permissions</code>	List all permissions on a private CA, if any, granted to the Certificate Manager (CM).
<code>list_tags</code>	Lists the tags, if any, that are associated with your private CA or one that has been shared with you.
<code>put_policy</code>	Attaches a resource-based policy to a private CA.
<code>restore_certificate_authority</code>	Restores a certificate authority (CA) that is in the DELETED state.
<code>revoke_certificate</code>	Revokes a certificate that was issued inside ACM Private CA.
<code>tag_certificate_authority</code>	Adds one or more tags to your private CA.
<code>untag_certificate_authority</code>	Remove one or more tags from your private CA.
<code>update_certificate_authority</code>	Updates the status or configuration of a private certificate authority (CA).

Examples

```
## Not run:
svc <- acmpca()
svc$create_certificate_authority(
  Foo = 123
)

## End(Not run)
```

clouddirectory	<i>Amazon CloudDirectory</i>
----------------	------------------------------

Description

Amazon Cloud Directory

Amazon Cloud Directory is a component of the AWS Directory Service that simplifies the development and management of cloud-scale web, mobile, and IoT applications. This guide describes the Cloud Directory operations that you can call programmatically and includes detailed information on data types and errors. For information about Cloud Directory features, see [AWS Directory Service](#) and the [Amazon Cloud Directory Developer Guide](#).

Usage

```
clouddirectory(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- clouddirectory(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[add_facet_to_object](#) Adds a new Facet to an object

apply_schema	Copies the input published schema, at the specified version, into the Directory with the sa
attach_object	Attaches an existing object to another object
attach_policy	Attaches a policy object to a regular object
attach_to_index	Attaches the specified object to the specified index
attach_typed_link	Attaches a typed link to a specified source and target object
batch_read	Performs all the read operations in a batch
batch_write	Performs all the write operations in a batch
create_directory	Creates a Directory by copying the published schema into the directory
create_facet	Creates a new Facet in a schema
create_index	Creates an index object
create_object	Creates an object in a Directory
create_schema	Creates a new schema in a development state
create_typed_link_facet	Creates a TypedLinkFacet
delete_directory	Deletes a directory
delete_facet	Deletes a given Facet
delete_object	Deletes an object and its associated attributes
delete_schema	Deletes a given schema
delete_typed_link_facet	Deletes a TypedLinkFacet
detach_from_index	Detaches the specified object from the specified index
detach_object	Detaches a given object from the parent object
detach_policy	Detaches a policy from an object
detach_typed_link	Detaches a typed link from a specified source and target object
disable_directory	Disables the specified directory
enable_directory	Enables the specified directory
get_applied_schema_version	Returns current applied schema version ARN, including the minor version in use
get_directory	Retrieves metadata about a directory
get_facet	Gets details of the Facet, such as facet name, attributes, Rules, or ObjectType
get_link_attributes	Retrieves attributes that are associated with a typed link
get_object_attributes	Retrieves attributes within a facet that are associated with an object
get_object_information	Retrieves metadata about an object
get_schema_as_json	Retrieves a JSON representation of the schema
get_typed_link_facet_information	Returns the identity attribute order for a specific TypedLinkFacet
list_applied_schema_arns	Lists schema major versions applied to a directory
list_attached_indices	Lists indices attached to the specified object
list_development_schema_arns	Retrieves each Amazon Resource Name (ARN) of schemas in the development state
list_directories	Lists directories created within an account
list_facet_attributes	Retrieves attributes attached to the facet
list_facet_names	Retrieves the names of facets that exist in a schema
list_incoming_typed_links	Returns a paginated list of all the incoming TypedLinkSpecifier information for an object
list_index	Lists objects attached to the specified index
list_managed_schema_arns	Lists the major version families of each managed schema
list_object_attributes	Lists all attributes that are associated with an object
list_object_children	Returns a paginated list of child objects that are associated with a given object
list_object_parent_paths	Retrieves all available parent paths for any object type such as node, leaf node, policy no
list_object_parents	Lists parent objects that are associated with a given object in pagination fashion
list_object_policies	Returns policies attached to an object in pagination fashion
list_outgoing_typed_links	Returns a paginated list of all the outgoing TypedLinkSpecifier information for an object
list_policy_attachments	Returns all of the ObjectIdentifiers to which a given policy is attached

<code>list_published_schema_arns</code>	Lists the major version families of each published schema
<code>list_tags_for_resource</code>	Returns tags for a resource
<code>list_typed_link_facet_attributes</code>	Returns a paginated list of all attribute definitions for a particular TypedLinkFacet
<code>list_typed_link_facet_names</code>	Returns a paginated list of TypedLink facet names for a particular schema
<code>lookup_policy</code>	Lists all policies from the root of the Directory to the object specified
<code>publish_schema</code>	Publishes a development schema with a major version and a recommended minor version
<code>put_schema_from_json</code>	Allows a schema to be updated using JSON upload
<code>remove_facet_from_object</code>	Removes the specified facet from the specified object
<code>tag_resource</code>	An API operation for adding tags to a resource
<code>untag_resource</code>	An API operation for removing tags from a resource
<code>update_facet</code>	Does the following:
<code>update_link_attributes</code>	Updates a given typed link's attributes
<code>update_object_attributes</code>	Updates a given object's attributes
<code>update_schema</code>	Updates the schema name with a new name
<code>update_typed_link_facet</code>	Updates a TypedLinkFacet
<code>upgrade_applied_schema</code>	Upgrades a single directory in-place using the PublishedSchemaArn with schema updates
<code>upgrade_published_schema</code>	Upgrades a published schema under a new minor version revision using the current content

Examples

```
## Not run:
svc <- clouddirectory()
svc$add_facet_to_object(
  Foo = 123
)

## End(Not run)
```

cloudhsm

Amazon CloudHSM

Description

AWS CloudHSM Service

This is documentation for **AWS CloudHSM Classic**. For more information, see [AWS CloudHSM Classic FAQs](#), the [AWS CloudHSM Classic User Guide](#), and the [AWS CloudHSM Classic API Reference](#).

For information about the current version of AWS CloudHSM, see [AWS CloudHSM](#), the [AWS CloudHSM User Guide](#), and the [AWS CloudHSM API Reference](#).

Usage

```
cloudhsm(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cloudhsm(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

```

cloudhsmv2

AWS CloudHSM V2

Description

For more information about AWS CloudHSM, see [AWS CloudHSM](#) and the [AWS CloudHSM User Guide](#).

Usage

```
cloudhsmv2(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cloudhsmv2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[copy_backup_to_region](#) Copy an AWS CloudHSM cluster backup to a different region

create_cluster	Creates a new AWS CloudHSM cluster
create_hsm	Creates a new hardware security module (HSM) in the specified AWS CloudHSM cluster
delete_backup	Deletes a specified AWS CloudHSM backup
delete_cluster	Deletes the specified AWS CloudHSM cluster
delete_hsm	Deletes the specified HSM
describe_backups	Gets information about backups of AWS CloudHSM clusters
describe_clusters	Gets information about AWS CloudHSM clusters
initialize_cluster	Claims an AWS CloudHSM cluster by submitting the cluster certificate issued by your issuing ce
list_tags	Gets a list of tags for the specified AWS CloudHSM cluster
modify_backup_attributes	Modifies attributes for AWS CloudHSM backup
modify_cluster	Modifies AWS CloudHSM cluster
restore_backup	Restores a specified AWS CloudHSM backup that is in the PENDING_DELETION state
tag_resource	Adds or overwrites one or more tags for the specified AWS CloudHSM cluster
untag_resource	Removes the specified tag or tags from the specified AWS CloudHSM cluster

Examples

```
## Not run:
svc <- cloudhsmv2()
svc$copy_backup_to_region(
  Foo = 123
)

## End(Not run)
```

cognitoidentity

Amazon Cognito Identity

Description

Amazon Cognito Federated Identities

Amazon Cognito Federated Identities is a web service that delivers scoped temporary credentials to mobile devices and other untrusted environments. It uniquely identifies a device and supplies the user with a consistent identity over the lifetime of an application.

Using Amazon Cognito Federated Identities, you can enable authentication with one or more third-party identity providers (Facebook, Google, or Login with Amazon) or an Amazon Cognito user pool, and you can also choose to support unauthenticated access from your app. Cognito delivers a unique identifier for each user and acts as an OpenID token provider trusted by AWS Security Token Service (STS) to access temporary, limited-privilege AWS credentials.

For a description of the authentication flow from the Amazon Cognito Developer Guide see [Authentication Flow](#).

For more information see [Amazon Cognito Federated Identities](#).

Usage

```
cognitoidentity(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- **region**: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cognitoidentity(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

<code>create_identity_pool</code>	Creates a new identity pool
<code>delete_identities</code>	Deletes identities from an identity pool
<code>delete_identity_pool</code>	Deletes an identity pool
<code>describe_identity</code>	Returns metadata related to the given identity, including when the identity was created
<code>describe_identity_pool</code>	Gets details about a particular identity pool, including the pool name, ID description, and creation date
<code>get_credentials_for_identity</code>	Returns credentials for the provided identity ID
<code>get_id</code>	Generates (or retrieves) a Cognito ID
<code>get_identity_pool_roles</code>	Gets the roles for an identity pool
<code>get_open_id_token</code>	Gets an OpenID token, using a known Cognito ID
<code>get_open_id_token_for_developer_identity</code>	Registers (or retrieves) a Cognito IdentityId and an OpenID Connect token for a DeveloperUserIdentifier
<code>get_principal_tag_attribute_map</code>	Use GetPrincipalTagAttributeMap to list all mappings between PrincipalTags and PrincipalAttributes
<code>list_identities</code>	Lists the identities in an identity pool
<code>list_identity_pools</code>	Lists all of the Cognito identity pools registered for your account
<code>list_tags_for_resource</code>	Lists the tags that are assigned to an Amazon Cognito identity pool
<code>lookup_developer_identity</code>	Retrieves the IdentityID associated with a DeveloperUserIdentifier or the list of DeveloperUserIdentifiers associated with an IdentityID
<code>merge_developer_identities</code>	Merges two users having different IdentityIds, existing in the same identity pool
<code>set_identity_pool_roles</code>	Sets the roles for an identity pool
<code>set_principal_tag_attribute_map</code>	You can use this operation to use default (username and clientID) attribute or custom attributes
<code>tag_resource</code>	Assigns a set of tags to the specified Amazon Cognito identity pool
<code>unlink_developer_identity</code>	Unlinks a DeveloperUserIdentifier from an existing identity
<code>unlink_identity</code>	Unlinks a federated identity from an existing account
<code>untag_resource</code>	Removes the specified tags from the specified Amazon Cognito identity pool
<code>update_identity_pool</code>	Updates an identity pool

Examples

```
## Not run:
svc <- cognitoidentity()
svc$create_identity_pool(
  Foo = 123
)

## End(Not run)
```

cognitoidentityprovider

Amazon Cognito Identity Provider

Description

Using the Amazon Cognito user pools API, you can create a user pool to manage directories and users. You can authenticate a user to obtain tokens related to user identity and access policies.

This API reference provides information about user pools in Amazon Cognito user pools.

For more information, see the [Amazon Cognito Documentation](#).

Usage

```
cognitoidentityprovider(config = list())
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cognitoidentityprovider(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
```

```

        s3_force_path_style = "logical"
    )
)

```

Operations

<code>add_custom_attributes</code>	Adds additional user attributes to the user pool schema
<code>admin_add_user_to_group</code>	Adds the specified user to the specified group
<code>admin_confirm_sign_up</code>	Confirms user registration as an admin without using a confirmation code
<code>admin_create_user</code>	Creates a new user in the specified user pool
<code>admin_delete_user</code>	Deletes a user as an administrator
<code>admin_delete_user_attributes</code>	Deletes the user attributes in a user pool as an administrator
<code>admin_disable_provider_for_user</code>	Prevents the user from signing in with the specified external (SAML or social) identity
<code>admin_disable_user</code>	Disables the specified user
<code>admin_enable_user</code>	Enables the specified user as an administrator
<code>admin_forget_device</code>	Forgets the device, as an administrator
<code>admin_get_device</code>	Gets the device, as an administrator
<code>admin_get_user</code>	Gets the specified user by user name in a user pool as an administrator
<code>admin_initiate_auth</code>	Initiates the authentication flow, as an administrator
<code>admin_link_provider_for_user</code>	Links an existing user account in a user pool (DestinationUser) to an identity from an external provider
<code>admin_list_devices</code>	Lists devices, as an administrator
<code>admin_list_groups_for_user</code>	Lists the groups that the user belongs to
<code>admin_list_user_auth_events</code>	A history of user activity and any risks detected as part of Amazon Cognito advanced security
<code>admin_remove_user_from_group</code>	Removes the specified user from the specified group
<code>admin_reset_user_password</code>	Resets the specified user's password in a user pool as an administrator
<code>admin_respond_to_auth_challenge</code>	Responds to an authentication challenge, as an administrator
<code>admin_set_user_mfa_preference</code>	The user's multi-factor authentication (MFA) preference, including which MFA option is preferred
<code>admin_set_user_password</code>	Sets the specified user's password in a user pool as an administrator
<code>admin_set_user_settings</code>	This action is no longer supported
<code>admin_update_auth_event_feedback</code>	Provides feedback for an authentication event indicating if it was from a valid user
<code>admin_update_device_status</code>	Updates the device status as an administrator
<code>admin_update_user_attributes</code>	Updates the specified user's attributes, including developer attributes, as an administrator
<code>admin_user_global_sign_out</code>	Signs out a user from all devices
<code>associate_software_token</code>	Begins setup of time-based one-time password (TOTP) multi-factor authentication (MFA)
<code>change_password</code>	Changes the password for a specified user in a user pool
<code>confirm_device</code>	Confirms tracking of the device
<code>confirm_forgot_password</code>	Allows a user to enter a confirmation code to reset a forgotten password
<code>confirm_sign_up</code>	Confirms registration of a new user
<code>create_group</code>	Creates a new group in the specified user pool
<code>create_identity_provider</code>	Creates an IdP for a user pool
<code>create_resource_server</code>	Creates a new OAuth2
<code>create_user_import_job</code>	Creates the user import job
<code>create_user_pool</code>	Creates a new Amazon Cognito user pool and sets the password policy for the pool
<code>create_user_pool_client</code>	Creates the user pool client
<code>create_user_pool_domain</code>	Creates a new domain for a user pool
<code>delete_group</code>	Deletes a group
<code>delete_identity_provider</code>	Deletes an IdP for a user pool
<code>delete_resource_server</code>	Deletes a resource server

<code>delete_user</code>	Allows a user to delete himself or herself
<code>delete_user_attributes</code>	Deletes the attributes for a user
<code>delete_user_pool</code>	Deletes the specified Amazon Cognito user pool
<code>delete_user_pool_client</code>	Allows the developer to delete the user pool client
<code>delete_user_pool_domain</code>	Deletes a domain for a user pool
<code>describe_identity_provider</code>	Gets information about a specific IdP
<code>describe_resource_server</code>	Describes a resource server
<code>describe_risk_configuration</code>	Describes the risk configuration
<code>describe_user_import_job</code>	Describes the user import job
<code>describe_user_pool</code>	Returns the configuration information and metadata of the specified user pool
<code>describe_user_pool_client</code>	Client method for returning the configuration information and metadata of the specified user pool client
<code>describe_user_pool_domain</code>	Gets information about a domain
<code>forget_device</code>	Forgets the specified device
<code>forgot_password</code>	Calling this API causes a message to be sent to the end user with a confirmation code to reset their password
<code>get_csv_header</code>	Gets the header information for the comma-separated value (CSV) file to be used as input for the user import job
<code>get_device</code>	Gets the device
<code>get_group</code>	Gets a group
<code>get_identity_provider_by_identifier</code>	Gets the specified IdP
<code>get_signing_certificate</code>	This method takes a user pool ID, and returns the signing certificate
<code>get_ui_customization</code>	Gets the user interface (UI) Customization information for a particular app client's user interface
<code>get_user</code>	Gets the user attributes and metadata for a user
<code>get_user_attribute_verification_code</code>	Generates a user attribute verification code for the specified attribute name
<code>get_user_pool_mfa_config</code>	Gets the user pool multi-factor authentication (MFA) configuration
<code>global_sign_out</code>	Signs out users from all devices
<code>initiate_auth</code>	Initiates sign-in for a user in the Amazon Cognito user directory
<code>list_devices</code>	Lists the sign-in devices that Amazon Cognito has registered to the current user
<code>list_groups</code>	Lists the groups associated with a user pool
<code>list_identity_providers</code>	Lists information about all IdPs for a user pool
<code>list_resource_servers</code>	Lists the resource servers for a user pool
<code>list_tags_for_resource</code>	Lists the tags that are assigned to an Amazon Cognito user pool
<code>list_user_import_jobs</code>	Lists the user import jobs
<code>list_user_pool_clients</code>	Lists the clients that have been created for the specified user pool
<code>list_user_pools</code>	Lists the user pools associated with an Amazon Web Services account
<code>list_users</code>	Lists the users in the Amazon Cognito user pool
<code>list_users_in_group</code>	Lists the users in the specified group
<code>resend_confirmation_code</code>	Resends the confirmation (for confirmation of registration) to a specific user in the user pool
<code>respond_to_auth_challenge</code>	Responds to the authentication challenge
<code>revoke_token</code>	Revokes all of the access tokens generated by the specified refresh token
<code>set_risk_configuration</code>	Configures actions on detected risks
<code>set_ui_customization</code>	Sets the user interface (UI) customization information for a user pool's built-in app UI
<code>set_user_mfa_preference</code>	Set the user's multi-factor authentication (MFA) method preference, including which MFA methods to use
<code>set_user_pool_mfa_config</code>	Sets the user pool multi-factor authentication (MFA) configuration
<code>set_user_settings</code>	This action is no longer supported
<code>sign_up</code>	Registers the user in the specified user pool and creates a user name, password, and user attributes
<code>start_user_import_job</code>	Starts the user import
<code>stop_user_import_job</code>	Stops the user import job
<code>tag_resource</code>	Assigns a set of tags to an Amazon Cognito user pool
<code>untag_resource</code>	Removes the specified tags from an Amazon Cognito user pool

update_auth_event_feedback	Provides the feedback for an authentication event, whether it was from a valid user or not
update_device_status	Updates the device status
update_group	Updates the specified group with the specified attributes
update_identity_provider	Updates IdP information for a user pool
update_resource_server	Updates the name and scopes of resource server
update_user_attributes	Allows a user to update a specific attribute (one at a time)
update_user_pool	Updates the specified user pool with the specified attributes
update_user_pool_client	Updates the specified user pool app client with the specified attributes
update_user_pool_domain	Updates the Secure Sockets Layer (SSL) certificate for the custom domain for your user pool
verify_software_token	Use this API to register a user's entered time-based one-time password (TOTP) code and verify it
verify_user_attribute	Verifies the specified user attributes in the user pool

Examples

```
## Not run:
svc <- cognitoidentityprovider()
svc$add_custom_attributes(
  Foo = 123
)

## End(Not run)
```

cognitosync

Amazon Cognito Sync

Description

Amazon Cognito Sync provides an AWS service and client library that enable cross-device syncing of application-related user data. High-level client libraries are available for both iOS and Android. You can use these libraries to persist data locally so that it's available even if the device is offline. Developer credentials don't need to be stored on the mobile device to access the service. You can use Amazon Cognito to obtain a normalized user ID and credentials. User data is persisted in a dataset that can store up to 1 MB of key-value pairs, and you can have up to 20 datasets per user identity.

With Amazon Cognito Sync, the data stored for each identity is accessible only to credentials assigned to that identity. In order to use the Cognito Sync service, you need to make API calls using credentials retrieved with [Amazon Cognito Identity service](#).

If you want to use Cognito Sync in an Android or iOS application, you will probably want to make API calls via the AWS Mobile SDK. To learn more, see the Developer Guide for Android and the Developer Guide for iOS.

Usage

```
cognitosync(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cognitosync(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations**bulk_publish**

Initiates a bulk publish of all existing datasets for an Identity Pool to the configured stream

<code>delete_dataset</code>	Deletes the specific dataset
<code>describe_dataset</code>	Gets meta data about a dataset by identity and dataset name
<code>describe_identity_pool_usage</code>	Gets usage details (for example, data storage) about a particular identity pool
<code>describe_identity_usage</code>	Gets usage information for an identity, including number of datasets and data usage
<code>get_bulk_publish_details</code>	Get the status of the last BulkPublish operation for an identity pool
<code>get_cognito_events</code>	Gets the events and the corresponding Lambda functions associated with an identity pool
<code>get_identity_pool_configuration</code>	Gets the configuration settings of an identity pool
<code>list_datasets</code>	Lists datasets for an identity
<code>list_identity_pool_usage</code>	Gets a list of identity pools registered with Cognito
<code>list_records</code>	Gets paginated records, optionally changed after a particular sync count for a dataset and id
<code>register_device</code>	Registers a device to receive push sync notifications
<code>set_cognito_events</code>	Sets the AWS Lambda function for a given event type for an identity pool
<code>set_identity_pool_configuration</code>	Sets the necessary configuration for push sync
<code>subscribe_to_dataset</code>	Subscribes to receive notifications when a dataset is modified by another device
<code>unsubscribe_from_dataset</code>	Unsubscribes from receiving notifications when a dataset is modified by another device
<code>update_records</code>	Posts updates to records and adds and deletes records for a dataset and user

Examples

```
## Not run:
svc <- cognitosync()
svc$bulk_publish(
  Foo = 123
)

## End(Not run)
```

detective

Amazon Detective

Description

Detective uses machine learning and purpose-built visualizations to help you to analyze and investigate security issues across your Amazon Web Services (Amazon Web Services) workloads. Detective automatically extracts time-based events such as login attempts, API calls, and network traffic from CloudTrail and Amazon Virtual Private Cloud (Amazon VPC) flow logs. It also extracts findings detected by Amazon GuardDuty.

The Detective API primarily supports the creation and management of behavior graphs. A behavior graph contains the extracted data from a set of member accounts, and is created and managed by an administrator account.

To add a member account to the behavior graph, the administrator account sends an invitation to the account. When the account accepts the invitation, it becomes a member account in the behavior graph.

Detective is also integrated with Organizations. The organization management account designates the Detective administrator account for the organization. That account becomes the administrator account for the organization behavior graph. The Detective administrator account is also the delegated administrator account for Detective in Organizations.

The Detective administrator account can enable any organization account as a member account in the organization behavior graph. The organization accounts do not receive invitations. The Detective administrator account can also invite other accounts to the organization behavior graph.

Every behavior graph is specific to a Region. You can only use the API to manage behavior graphs that belong to the Region that is associated with the currently selected endpoint.

The administrator account for a behavior graph can use the Detective API to do the following:

- Enable and disable Detective. Enabling Detective creates a new behavior graph.
- View the list of member accounts in a behavior graph.
- Add member accounts to a behavior graph.
- Remove member accounts from a behavior graph.
- Apply tags to a behavior graph.

The organization management account can use the Detective API to select the delegated administrator for Detective.

The Detective administrator account for an organization can use the Detective API to do the following:

- Perform all of the functions of an administrator account.
- Determine whether to automatically enable new organization accounts as member accounts in the organization behavior graph.

An invited member account can use the Detective API to do the following:

- View the list of behavior graphs that they are invited to.
- Accept an invitation to contribute to a behavior graph.
- Decline an invitation to contribute to a behavior graph.
- Remove their account from a behavior graph.

All API actions are logged as CloudTrail events. See [Logging Detective API Calls with CloudTrail](#).

We replaced the term "master account" with the term "administrator account." An administrator account is used to centrally manage multiple accounts. In the case of Detective, the administrator account manages the accounts in their behavior graph.

Usage

```
detective(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- detective(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[accept_invitation](#)

Accepts an invitation for the member account to contribute data to a behavior graph

batch_get_graph_member_datasources	Gets data source package information for the behavior graph
batch_get_membership_datasources	Gets information on the data source package history for an account
create_graph	Creates a new behavior graph for the calling account, and sets that account as the administrator. CreateMembers is used to send invitations to accounts
create_members	CreateMembers is used to send invitations to accounts
delete_graph	Disables the specified behavior graph and queues it to be deleted
delete_members	Removes the specified member accounts from the behavior graph
describe_organization_configuration	Returns information about the configuration for the organization behavior graph
disable_organization_admin_account	Removes the Detective administrator account in the current Region
disassociate_membership	Removes the member account from the specified behavior graph
enable_organization_admin_account	Designates the Detective administrator account for the organization in the current Region
get_members	Returns the membership details for specified member accounts for a behavior graph
list_datasource_packages	Lists data source packages in the behavior graph
list_graphs	Returns the list of behavior graphs that the calling account is an administrator account for
list_invitations	Retrieves the list of open and accepted behavior graph invitations for the member account
list_members	Retrieves the list of member accounts for a behavior graph
list_organization_admin_accounts	Returns information about the Detective administrator account for an organization
list_tags_for_resource	Returns the tag values that are assigned to a behavior graph
reject_invitation	Rejects an invitation to contribute the account data to a behavior graph
start_monitoring_member	Sends a request to enable data ingest for a member account that has a status of ACCEPTED
tag_resource	Applies tag values to a behavior graph
untag_resource	Removes tags from a behavior graph
update_datasource_packages	Starts a data source packages for the behavior graph
update_organization_configuration	Updates the configuration for the Organizations integration in the current Region

Examples

```
## Not run:
svc <- detective()
svc$accept_invitation(
  Foo = 123
)

## End(Not run)
```

directoryservice

AWS Directory Service

Description

Directory Service

Directory Service is a web service that makes it easy for you to setup and run directories in the Amazon Web Services cloud, or connect your Amazon Web Services resources with an existing self-managed Microsoft Active Directory. This guide provides detailed information about Directory

Service operations, data types, parameters, and errors. For information about Directory Services features, see [Directory Service](#) and the [Directory Service Administration Guide](#).

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, iOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to Directory Service and other Amazon Web Services services. For more information about the Amazon Web Services SDKs, including how to download and install them, see [Tools for Amazon Web Services](#).

Usage

```
directoryservice(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- directoryservice(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
```

```

    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

```

Operations

accept_shared_directory	Accepts a directory sharing request that was sent from the directory owner account
add_ip_routes	If the DNS server for your self-managed domain uses a publicly addressable IP address
add_region	Adds two domain controllers in the specified Region for the specified directory
add_tags_to_resource	Adds or overwrites one or more tags for the specified directory
cancel_schema_extension	Cancels an in-progress schema extension to a Microsoft AD directory
connect_directory	Creates an AD Connector to connect to a self-managed directory
create_alias	Creates an alias for a directory and assigns the alias to the directory
create_computer	Creates an Active Directory computer object in the specified directory
create_conditional_forwarder	Creates a conditional forwarder associated with your Amazon Web Services directory
create_directory	Creates a Simple AD directory
create_log_subscription	Creates a subscription to forward real-time Directory Service domain controller security events
create_microsoft_ad	Creates a Microsoft AD directory in the Amazon Web Services Cloud
create_snapshot	Creates a snapshot of a Simple AD or Microsoft AD directory in the Amazon Web Services Cloud
create_trust	Directory Service for Microsoft Active Directory allows you to configure trust relationships between your Managed Microsoft AD directory and another Active Directory
delete_conditional_forwarder	Deletes a conditional forwarder that has been set up for your Amazon Web Services directory
delete_directory	Deletes an Directory Service directory
delete_log_subscription	Deletes the specified log subscription
delete_snapshot	Deletes a directory snapshot
delete_trust	Deletes an existing trust relationship between your Managed Microsoft AD directory and another Active Directory
deregister_certificate	Deletes from the system the certificate that was registered for secure LDAP or client authentication
deregister_event_topic	Removes the specified directory as a publisher to the specified Amazon SNS topic
describe_certificate	Displays information about the certificate registered for secure LDAP or client authentication
describe_client_authentication_settings	Retrieves information about the type of client authentication for the specified directory
describe_conditional_forwarders	Obtains information about the conditional forwarders for this account
describe_directories	Obtains information about the directories that belong to this account
describe_domain_controllers	Provides information about any domain controllers in your directory
describe_event_topics	Obtains information about which Amazon SNS topics receive status messages from this account
describe_ldaps_settings	Describes the status of LDAP security for the specified directory
describe_regions	Provides information about the Regions that are configured for multi-Region replication
describe_settings	Retrieves information about the configurable settings for the specified directory
describe_shared_directories	Returns the shared directories in your account
describe_snapshots	Obtains information about the directory snapshots that belong to this account
describe_trusts	Obtains information about the trust relationships for this account
disable_client_authentication	Disables alternative client authentication methods for the specified directory
disable_ldaps	Deactivates LDAP secure calls for the specified directory
disable_radius	Disables multi-factor authentication (MFA) with the Remote Authentication Dial In User Service (RADIUS) protocol
disable_sso	Disables single-sign on for a directory

<code>enable_client_authentication</code>	Enables alternative client authentication methods for the specified directory
<code>enable_ldaps</code>	Activates the switch for the specific directory to always use LDAP secure calls
<code>enable_radius</code>	Enables multi-factor authentication (MFA) with the Remote Authentication Dial In
<code>enable_sso</code>	Enables single sign-on for a directory
<code>get_directory_limits</code>	Obtains directory limit information for the current Region
<code>get_snapshot_limits</code>	Obtains the manual snapshot limits for a directory
<code>list_certificates</code>	For the specified directory, lists all the certificates registered for a secure LDAP or c
<code>list_ip_routes</code>	Lists the address blocks that you have added to a directory
<code>list_log_subscriptions</code>	Lists the active log subscriptions for the Amazon Web Services account
<code>list_schema_extensions</code>	Lists all schema extensions applied to a Microsoft AD Directory
<code>list_tags_for_resource</code>	Lists all tags on a directory
<code>register_certificate</code>	Registers a certificate for a secure LDAP or client certificate authentication
<code>register_event_topic</code>	Associates a directory with an Amazon SNS topic
<code>reject_shared_directory</code>	Rejects a directory sharing request that was sent from the directory owner account
<code>remove_ip_routes</code>	Removes IP address blocks from a directory
<code>remove_region</code>	Stops all replication and removes the domain controllers from the specified Region
<code>remove_tags_from_resource</code>	Removes tags from a directory
<code>reset_user_password</code>	Resets the password for any user in your Managed Microsoft AD or Simple AD dire
<code>restore_from_snapshot</code>	Restores a directory using an existing directory snapshot
<code>share_directory</code>	Shares a specified directory (DirectoryId) in your Amazon Web Services account (d
<code>start_schema_extension</code>	Applies a schema extension to a Microsoft AD directory
<code>unshare_directory</code>	Stops the directory sharing between the directory owner and consumer accounts
<code>update_conditional_forwarder</code>	Updates a conditional forwarder that has been set up for your Amazon Web Service
<code>update_number_of_domain_controllers</code>	Adds or removes domain controllers to or from the directory
<code>update_radius</code>	Updates the Remote Authentication Dial In User Service (RADIUS) server informa
<code>update_settings</code>	Updates the configurable settings for the specified directory
<code>update_trust</code>	Updates the trust that has been set up between your Managed Microsoft AD directo
<code>verify_trust</code>	Directory Service for Microsoft Active Directory allows you to configure and verify

Examples

```
## Not run:
svc <- directoryservice()
svc$accept_shared_directory(
  Foo = 123
)

## End(Not run)
```

Description

This is the *Firewall Manager API Reference*. This guide is for developers who need detailed information about the Firewall Manager API actions, data types, and errors. For detailed information about Firewall Manager features, see the [Firewall Manager Developer Guide](#).

Some API actions require explicit resource permissions. For information, see the developer guide topic [Firewall Manager required permissions for API actions](#).

Usage

```
fms(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- fms(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
  )
```

```

        endpoint = "string",
        region = "string",
        close_connection = "logical",
        timeout = "numeric",
        s3_force_path_style = "logical"
    )
)

```

Operations

associate_admin_account	Sets the Firewall Manager administrator account
associate_third_party_firewall	Sets the Firewall Manager policy administrator as a tenant administrator of a third-party firewall
delete_apps_list	Permanently deletes an Firewall Manager applications list
delete_notification_channel	Deletes an Firewall Manager association with the IAM role and the Amazon Simple Notification Service (SNS) topic
delete_policy	Permanently deletes an Firewall Manager policy
delete_protocols_list	Permanently deletes an Firewall Manager protocols list
disassociate_admin_account	Disassociates the account that has been set as the Firewall Manager administrator
disassociate_third_party_firewall	Disassociates a Firewall Manager policy administrator from a third-party firewall
get_admin_account	Returns the Organizations account that is associated with Firewall Manager as the administrator
get_apps_list	Returns information about the specified Firewall Manager applications list
get_compliance_detail	Returns detailed compliance information about the specified member account
get_notification_channel	Information about the Amazon Simple Notification Service (SNS) topic that is associated with the Firewall Manager policy
get_policy	Returns information about the specified Firewall Manager policy
get_protection_status	If you created a Shield Advanced policy, returns policy-level attack summary information
get_protocols_list	Returns information about the specified Firewall Manager protocols list
get_third_party_firewall_association_status	The onboarding status of a Firewall Manager admin account to third-party firewall
get_violation_details	Retrieves violations for a resource based on the specified Firewall Manager policy
list_apps_lists	Returns an array of AppsListDataSummary objects
list_compliance_status	Returns an array of PolicyComplianceStatus objects
list_member_accounts	Returns a MemberAccounts object that lists the member accounts in the administrator's account
list_policies	Returns an array of PolicySummary objects
list_protocols_lists	Returns an array of ProtocolsListDataSummary objects
list_tags_for_resource	Retrieves the list of tags for the specified Amazon Web Services resource
list_third_party_firewall_firewall_policies	Retrieves a list of all of the third-party firewall policies that are associated with the Firewall Manager policy
put_apps_list	Creates an Firewall Manager applications list
put_notification_channel	Designates the IAM role and Amazon Simple Notification Service (SNS) topic for the Firewall Manager policy
put_policy	Creates an Firewall Manager policy
put_protocols_list	Creates an Firewall Manager protocols list
tag_resource	Adds one or more tags to an Amazon Web Services resource
untag_resource	Removes one or more tags from an Amazon Web Services resource

Examples

```

## Not run:
svc <- fms()
svc$associate_admin_account(

```

```
    Foo = 123
)

## End(Not run)
```

guardduty

Amazon GuardDuty

Description

Amazon GuardDuty is a continuous security monitoring service that analyzes and processes the following data sources: VPC Flow Logs, AWS CloudTrail management event logs, CloudTrail S3 data event logs, EKS audit logs, and DNS logs. It uses threat intelligence feeds (such as lists of malicious IPs and domains) and machine learning to identify unexpected, potentially unauthorized, and malicious activity within your Amazon Web Services environment. This can include issues like escalations of privileges, uses of exposed credentials, or communication with malicious IPs, URLs, or domains. For example, GuardDuty can detect compromised EC2 instances that serve malware or mine bitcoin.

GuardDuty also monitors Amazon Web Services account access behavior for signs of compromise. Some examples of this are unauthorized infrastructure deployments such as EC2 instances deployed in a Region that has never been used, or unusual API calls like a password policy change to reduce password strength.

GuardDuty informs you of the status of your Amazon Web Services environment by producing security findings that you can view in the GuardDuty console or through Amazon CloudWatch events. For more information, see the <https://docs.aws.amazon.com/guardduty/latest/ug/what-is-guardduty.html> *Amazon GuardDuty User Guide* .

Usage

```
guardduty(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none">• access_key_id: AWS access key ID• secret_access_key: AWS secret access key• session_token: AWS temporary session token• profile: The name of a profile to use. If not given, then the default profile is used.• anonymous: Set anonymous credentials.• endpoint: The complete URL to use for the constructed client.• region: The AWS Region used in instantiating the client.• close_connection: Immediately close all HTTP connections.• timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
--------	--

- **s3_force_path_style**: Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- guardduty(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

accept_administrator_invitation	Accepts the invitation to be a member account and get monitored by a GuardDuty administrator account
accept_invitation	Accepts the invitation to be monitored by a GuardDuty administrator account
archive_findings	Archives GuardDuty findings that are specified by the list of finding IDs
create_detector	Creates a single Amazon GuardDuty detector
create_filter	Creates a filter using the specified finding criteria
create_ip_set	Creates a new IPSet, which is called a trusted IP list in the console user interface
create_members	Creates member accounts of the current Amazon Web Services account by specifying a list of email addresses
create_publishing_destination	Creates a publishing destination to export findings to
create_sample_findings	Generates example findings of types specified by the list of finding types
create_threat_intel_set	Creates a new ThreatIntelSet
decline_invitations	Declines invitations sent to the current member account by Amazon Web Services
delete_detector	Deletes an Amazon GuardDuty detector that is specified by the detector ID
delete_filter	Deletes the filter specified by the filter name
delete_invitations	Deletes invitations sent to the current member account by Amazon Web Services
delete_ip_set	Deletes the IPSet specified by the ipSetId
delete_members	Deletes GuardDuty member accounts (to the current GuardDuty administrator account)
delete_publishing_destination	Deletes the publishing definition with the specified destinationId

delete_threat_intel_set	Deletes the ThreatIntelSet specified by the ThreatIntelSet ID
describe_malware_scans	Returns a list of malware scans
describe_organization_configuration	Returns information about the account selected as the delegated administrator for the organization
describe_publishing_destination	Returns information about the publishing destination specified by the provided detectorId
disable_organization_admin_account	Disables an Amazon Web Services account within the Organization as the GuardDuty administrator
disassociate_from_administrator_account	Disassociates the current GuardDuty member account from its administrator account
disassociate_from_master_account	Disassociates the current GuardDuty member account from its administrator account
disassociate_members	Disassociates GuardDuty member accounts (to the current GuardDuty administrator account)
enable_organization_admin_account	Enables an Amazon Web Services account within the organization as the GuardDuty administrator
get_administrator_account	Provides the details for the GuardDuty administrator account associated with the current organization
get_detector	Retrieves an Amazon GuardDuty detector specified by the detectorId
get_filter	Returns the details of the filter specified by the filter name
get_findings	Describes Amazon GuardDuty findings specified by finding IDs
get_findings_statistics	Lists Amazon GuardDuty findings statistics for the specified detector ID
get_invitations_count	Returns the count of all GuardDuty membership invitations that were sent to the current organization
get_ip_set	Retrieves the IPSet specified by the ipSetId
get_malware_scan_settings	Returns the details of the malware scan settings
get_master_account	Provides the details for the GuardDuty administrator account associated with the current organization
get_member_detectors	Describes which data sources are enabled for the member account's detector
get_members	Retrieves GuardDuty member accounts (of the current GuardDuty administrator account)
get_remaining_free_trial_days	Provides the number of days left for each data source used in the free trial period
get_threat_intel_set	Retrieves the ThreatIntelSet that is specified by the ThreatIntelSet ID
get_usage_statistics	Lists Amazon GuardDuty usage statistics over the last 30 days for the specified detector ID
invite_members	Invites other Amazon Web Services accounts (created as members of the current organization)
list_detectors	Lists detectorIds of all the existing Amazon GuardDuty detector resources
list_filters	Returns a paginated list of the current filters
list_findings	Lists Amazon GuardDuty findings for the specified detector ID
list_invitations	Lists all GuardDuty membership invitations that were sent to the current Amazon Web Services account
list_ip_sets	Lists the IPSets of the GuardDuty service specified by the detector ID
list_members	Lists details about all member accounts for the current GuardDuty administrator account
list_organization_admin_accounts	Lists the accounts configured as GuardDuty delegated administrators
list_publishing_destinations	Returns a list of publishing destinations associated with the specified detectorId
list_tags_for_resource	Lists tags for a resource
list_threat_intel_sets	Lists the ThreatIntelSets of the GuardDuty service specified by the detector ID
start_monitoring_members	Turns on GuardDuty monitoring of the specified member accounts
stop_monitoring_members	Stops GuardDuty monitoring for the specified member accounts
tag_resource	Adds tags to a resource
unarchive_findings	Unarchives GuardDuty findings specified by the findingIds
untag_resource	Removes tags from a resource
update_detector	Updates the Amazon GuardDuty detector specified by the detectorId
update_filter	Updates the filter specified by the filter name
update_findings_feedback	Marks the specified GuardDuty findings as useful or not useful
update_ip_set	Updates the IPSet specified by the IPSet ID
update_malware_scan_settings	Updates the malware scan settings
update_member_detectors	Contains information on member accounts to be updated
update_organization_configuration	Updates the delegated administrator account with the values provided
update_publishing_destination	Updates information about the publishing destination specified by the destinationId
update_threat_intel_set	Updates the ThreatIntelSet specified by the ThreatIntelSet ID

Examples

```
## Not run:
svc <- guardduty()
svc$accept_administrator_invitation(
  Foo = 123
)

## End(Not run)
```

iam

AWS Identity and Access Management

Description

Identity and Access Management

Identity and Access Management (IAM) is a web service for securely controlling access to Amazon Web Services services. With IAM, you can centrally manage users, security credentials such as access keys, and permissions that control which Amazon Web Services resources users and applications can access. For more information about IAM, see [Identity and Access Management \(IAM\)](#) and the [Identity and Access Management User Guide](#).

Usage

```
iam(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- **region**: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- iam(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Adds a new client ID (also known as audience) to the list of client IDs a
 Adds the specified IAM role to the specified instance profile
 Adds the specified user to the specified group
 Attaches the specified managed policy to the specified IAM group
 Attaches the specified managed policy to the specified IAM role
 Attaches the specified managed policy to the specified user
 Changes the password of the IAM user who is calling this operation
 Creates a new Amazon Web Services secret access key and correspondi
 Creates an alias for your Amazon Web Services account
 Creates a new group
 Creates a new instance profile
 Creates a password for the specified IAM user
 Creates an IAM entity to describe an identity provider (IdP) that support
 Creates a new managed policy for your Amazon Web Services account
 Creates a new version of the specified managed policy
 Creates a new role for your Amazon Web Services account
 Creates an IAM resource that describes an identity provider (IdP) that s
 Creates an IAM role that is linked to a specific Amazon Web Services s
 Generates a set of credentials consisting of a user name and password th
 Creates a new IAM user for your Amazon Web Services account

<code>create_virtual_mfa_device</code>	Creates a new virtual MFA device for the Amazon Web Services account
<code>deactivate_mfa_device</code>	Deactivates the specified MFA device and removes it from association with the specified IAM user
<code>delete_access_key</code>	Deletes the access key pair associated with the specified IAM user
<code>delete_account_alias</code>	Deletes the specified Amazon Web Services account alias
<code>delete_account_password_policy</code>	Deletes the password policy for the Amazon Web Services account
<code>delete_group</code>	Deletes the specified IAM group
<code>delete_group_policy</code>	Deletes the specified inline policy that is embedded in the specified IAM group
<code>delete_instance_profile</code>	Deletes the specified instance profile
<code>delete_login_profile</code>	Deletes the password for the specified IAM user, which terminates the user's session
<code>delete_open_id_connect_provider</code>	Deletes an OpenID Connect identity provider (IdP) resource object in IAM
<code>delete_policy</code>	Deletes the specified managed policy
<code>delete_policy_version</code>	Deletes the specified version from the specified managed policy
<code>delete_role</code>	Deletes the specified role
<code>delete_role_permissions_boundary</code>	Deletes the permissions boundary for the specified IAM role
<code>delete_role_policy</code>	Deletes the specified inline policy that is embedded in the specified IAM role
<code>delete_saml_provider</code>	Deletes a SAML provider resource in IAM
<code>delete_server_certificate</code>	Deletes the specified server certificate
<code>delete_service_linked_role</code>	Submits a service-linked role deletion request and returns a <code>DeletionTaskStatus</code> object
<code>delete_service_specific_credential</code>	Deletes the specified service-specific credential
<code>delete_signing_certificate</code>	Deletes a signing certificate associated with the specified IAM user
<code>delete_ssh_public_key</code>	Deletes the specified SSH public key
<code>delete_user</code>	Deletes the specified IAM user
<code>delete_user_permissions_boundary</code>	Deletes the permissions boundary for the specified IAM user
<code>delete_user_policy</code>	Deletes the specified inline policy that is embedded in the specified IAM user
<code>delete_virtual_mfa_device</code>	Deletes a virtual MFA device
<code>detach_group_policy</code>	Removes the specified managed policy from the specified IAM group
<code>detach_role_policy</code>	Removes the specified managed policy from the specified role
<code>detach_user_policy</code>	Removes the specified managed policy from the specified user
<code>enable_mfa_device</code>	Enables the specified MFA device and associates it with the specified IAM user
<code>generate_credential_report</code>	Generates a credential report for the Amazon Web Services account
<code>generate_organizations_access_report</code>	Generates a report for service last accessed data for Organizations
<code>generate_service_last_accessed_details</code>	Generates a report that includes details about when an IAM resource (user, group, role, or policy) was last accessed
<code>get_access_key_last_used</code>	Retrieves information about when the specified access key was last used
<code>get_account_authorization_details</code>	Retrieves information about all IAM users, groups, roles, and policies in the account
<code>get_account_password_policy</code>	Retrieves the password policy for the Amazon Web Services account
<code>get_account_summary</code>	Retrieves information about IAM entity usage and IAM quotas in the account
<code>get_context_keys_for_custom_policy</code>	Gets a list of all of the context keys referenced in the input policies
<code>get_context_keys_for_principal_policy</code>	Gets a list of all of the context keys referenced in all the IAM policies that are attached to the specified principal
<code>get_credential_report</code>	Retrieves a credential report for the Amazon Web Services account
<code>get_group</code>	Returns a list of IAM users that are in the specified IAM group
<code>get_group_policy</code>	Retrieves the specified inline policy document that is embedded in the specified IAM group
<code>get_instance_profile</code>	Retrieves information about the specified instance profile, including the associated Amazon EC2 instance profile name
<code>get_login_profile</code>	Retrieves the user name for the specified IAM user
<code>get_open_id_connect_provider</code>	Returns information about the specified OpenID Connect (OIDC) provider
<code>get_organizations_access_report</code>	Retrieves the service last accessed data report for Organizations that was generated by the <code>generate_organizations_access_report</code> action
<code>get_policy</code>	Retrieves information about the specified managed policy, including the policy document
<code>get_policy_version</code>	Retrieves information about the specified version of the specified managed policy
<code>get_role</code>	Retrieves information about the specified role, including the role's path, permissions boundary, and associated inline policies

<code>get_role_policy</code>	Retrieves the specified inline policy document that is embedded with the
<code>get_saml_provider</code>	Returns the SAML provider metadocument that was uploaded when the
<code>get_server_certificate</code>	Retrieves information about the specified server certificate stored in IAM
<code>get_service_last_accessed_details</code>	Retrieves a service last accessed report that was created using the GenerateServiceLastAccessedDetails
<code>get_service_last_accessed_details_with_entities</code>	After you generate a group or policy report using the GenerateServiceLastAccessedDetails
<code>get_service_linked_role_deletion_status</code>	Retrieves the status of your service-linked role deletion
<code>get_ssh_public_key</code>	Retrieves the specified SSH public key, including metadata about the key
<code>get_user</code>	Retrieves information about the specified IAM user, including the user's
<code>get_user_policy</code>	Retrieves the specified inline policy document that is embedded in the s
<code>list_access_keys</code>	Returns information about the access key IDs associated with the specif
<code>list_account_aliases</code>	Lists the account alias associated with the Amazon Web Services accou
<code>list_attached_group_policies</code>	Lists all managed policies that are attached to the specified IAM group
<code>list_attached_role_policies</code>	Lists all managed policies that are attached to the specified IAM role
<code>list_attached_user_policies</code>	Lists all managed policies that are attached to the specified IAM user
<code>list_entities_for_policy</code>	Lists all IAM users, groups, and roles that the specified managed policy
<code>list_group_policies</code>	Lists the names of the inline policies that are embedded in the specified
<code>list_groups</code>	Lists the IAM groups that have the specified path prefix
<code>list_groups_for_user</code>	Lists the IAM groups that the specified IAM user belongs to
<code>list_instance_profiles</code>	Lists the instance profiles that have the specified path prefix
<code>list_instance_profiles_for_role</code>	Lists the instance profiles that have the specified associated IAM role
<code>list_instance_profile_tags</code>	Lists the tags that are attached to the specified IAM instance profile
<code>list_mfa_devices</code>	Lists the MFA devices for an IAM user
<code>list_mfa_device_tags</code>	Lists the tags that are attached to the specified IAM virtual multi-factor
<code>list_open_id_connect_providers</code>	Lists information about the IAM OpenID Connect (OIDC) provider reso
<code>list_open_id_connect_provider_tags</code>	Lists the tags that are attached to the specified OpenID Connect (OIDC)
<code>list_policies</code>	Lists all the managed policies that are available in your Amazon Web S
<code>list_policies_granting_service_access</code>	Retrieves a list of policies that the IAM identity (user, group, or role) ca
<code>list_policy_tags</code>	Lists the tags that are attached to the specified IAM customer managed p
<code>list_policy_versions</code>	Lists information about the versions of the specified managed policy, in
<code>list_role_policies</code>	Lists the names of the inline policies that are embedded in the specified
<code>list_roles</code>	Lists the IAM roles that have the specified path prefix
<code>list_role_tags</code>	Lists the tags that are attached to the specified role
<code>list_saml_providers</code>	Lists the SAML provider resource objects defined in IAM in the account
<code>list_saml_provider_tags</code>	Lists the tags that are attached to the specified Security Assertion Marku
<code>list_server_certificates</code>	Lists the server certificates stored in IAM that have the specified path pr
<code>list_server_certificate_tags</code>	Lists the tags that are attached to the specified IAM server certificate
<code>list_service_specific_credentials</code>	Returns information about the service-specific credentials associated wi
<code>list_signing_certificates</code>	Returns information about the signing certificates associated with the sp
<code>list_ssh_public_keys</code>	Returns information about the SSH public keys associated with the spec
<code>list_user_policies</code>	Lists the names of the inline policies embedded in the specified IAM us
<code>list_users</code>	Lists the IAM users that have the specified path prefix
<code>list_user_tags</code>	Lists the tags that are attached to the specified IAM user
<code>list_virtual_mfa_devices</code>	Lists the virtual MFA devices defined in the Amazon Web Services acco
<code>put_group_policy</code>	Adds or updates an inline policy document that is embedded in the spec
<code>put_role_permissions_boundary</code>	Adds or updates the policy that is specified as the IAM role's permission
<code>put_role_policy</code>	Adds or updates an inline policy document that is embedded in the spec
<code>put_user_permissions_boundary</code>	Adds or updates the policy that is specified as the IAM user's permission
<code>put_user_policy</code>	Adds or updates an inline policy document that is embedded in the spec

<code>remove_client_id_from_open_id_connect_provider</code>	Removes the specified client ID (also known as audience) from the list of
<code>remove_role_from_instance_profile</code>	Removes the specified IAM role from the specified EC2 instance profile
<code>remove_user_from_group</code>	Removes the specified user from the specified group
<code>reset_service_specific_credential</code>	Resets the password for a service-specific credential
<code>resync_mfa_device</code>	Synchronizes the specified MFA device with its IAM resource object on
<code>set_default_policy_version</code>	Sets the specified version of the specified policy as the policy's default (
<code>set_security_token_service_preferences</code>	Sets the specified version of the global endpoint token as the token versi
<code>simulate_custom_policy</code>	Simulate how a set of IAM policies and optionally a resource-based pol
<code>simulate_principal_policy</code>	Simulate how a set of IAM policies attached to an IAM entity works wi
<code>tag_instance_profile</code>	Adds one or more tags to an IAM instance profile
<code>tag_mfa_device</code>	Adds one or more tags to an IAM virtual multi-factor authentication (M
<code>tag_open_id_connect_provider</code>	Adds one or more tags to an OpenID Connect (OIDC)-compatible ident
<code>tag_policy</code>	Adds one or more tags to an IAM customer managed policy
<code>tag_role</code>	Adds one or more tags to an IAM role
<code>tag_saml_provider</code>	Adds one or more tags to a Security Assertion Markup Language (SAM
<code>tag_server_certificate</code>	Adds one or more tags to an IAM server certificate
<code>tag_user</code>	Adds one or more tags to an IAM user
<code>untag_instance_profile</code>	Removes the specified tags from the IAM instance profile
<code>untag_mfa_device</code>	Removes the specified tags from the IAM virtual multi-factor authentica
<code>untag_open_id_connect_provider</code>	Removes the specified tags from the specified OpenID Connect (OIDC)
<code>untag_policy</code>	Removes the specified tags from the customer managed policy
<code>untag_role</code>	Removes the specified tags from the role
<code>untag_saml_provider</code>	Removes the specified tags from the specified Security Assertion Marku
<code>untag_server_certificate</code>	Removes the specified tags from the IAM server certificate
<code>untag_user</code>	Removes the specified tags from the user
<code>update_access_key</code>	Changes the status of the specified access key from Active to Inactive, o
<code>update_account_password_policy</code>	Updates the password policy settings for the Amazon Web Services acco
<code>update_assume_role_policy</code>	Updates the policy that grants an IAM entity permission to assume a rol
<code>update_group</code>	Updates the name and/or the path of the specified IAM group
<code>update_login_profile</code>	Changes the password for the specified IAM user
<code>update_open_id_connect_provider_thumbprint</code>	Replaces the existing list of server certificate thumbprints associated wi
<code>update_role</code>	Updates the description or maximum session duration setting of a role
<code>update_role_description</code>	Use UpdateRole instead
<code>update_saml_provider</code>	Updates the metadata document for an existing SAML provider resource
<code>update_server_certificate</code>	Updates the name and/or the path of the specified server certificate store
<code>update_service_specific_credential</code>	Sets the status of a service-specific credential to Active or Inactive
<code>update_signing_certificate</code>	Changes the status of the specified user signing certificate from active to
<code>update_ssh_public_key</code>	Sets the status of an IAM user's SSH public key to active or inactive
<code>update_user</code>	Updates the name and/or the path of the specified IAM user
<code>upload_server_certificate</code>	Uploads a server certificate entity for the Amazon Web Services account
<code>upload_signing_certificate</code>	Uploads an X
<code>upload_ssh_public_key</code>	Uploads an SSH public key and associates it with the specified IAM use

Examples

```
## Not run:
svc <- iam()
```

```
# The following add-client-id-to-open-id-connect-provider command adds the
# client ID my-application-ID to the OIDC provider named
# server.example.com:
svc$add_client_id_to_open_id_connect_provider(
  ClientID = "my-application-ID",
  OpenIDConnectProviderArn = "arn:aws:iam::123456789012:oidc-provider/server.example.com"
)

## End(Not run)
```

iamrolesanywhere *IAM Roles Anywhere*

Description

AWS Identity and Access Management Roles Anywhere provides a secure way for your workloads such as servers, containers, and applications running outside of AWS to obtain Temporary AWS credentials. Your workloads can use the same IAM policies and roles that you have configured with native AWS applications to access AWS resources. Using IAM Roles Anywhere will eliminate the need to manage long term credentials for workloads running outside of AWS.

To use IAM Roles Anywhere customer workloads will need to use X.509 certificates issued by their Certificate Authority (CA). The Certificate Authority (CA) needs to be registered with IAM Roles Anywhere as a trust anchor to establish trust between customer PKI and IAM Roles Anywhere. Customers who do not manage their own PKI system can use AWS Certificate Manager Private Certificate Authority (ACM PCA) to create a Certificate Authority and use that to establish trust with IAM Roles Anywhere.

This guide describes the IAM rolesanywhere operations that you can call programmatically. For general information about IAM Roles Anywhere see <https://docs.aws.amazon.com/>

Usage

```
iamrolesanywhere(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none">• access_key_id: AWS access key ID• secret_access_key: AWS secret access key• session_token: AWS temporary session token• profile: The name of a profile to use. If not given, then the default profile is used.• anonymous: Set anonymous credentials.• endpoint: The complete URL to use for the constructed client.• region: The AWS Region used in instantiating the client.• close_connection: Immediately close all HTTP connections.
--------	--

- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to true to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- iamrolesanywhere(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

create_profile	Creates a profile
create_trust_anchor	Creates a trust anchor
delete_crl	Deletes a certificate revocation list (CRL)
delete_profile	Deletes a profile
delete_trust_anchor	Deletes a trust anchor
disable_crl	Disables a certificate revocation list (CRL)
disable_profile	Disables a profile
disable_trust_anchor	Disables a trust anchor
enable_crl	Enables a certificate revocation list (CRL)
enable_profile	Enables the roles in a profile to receive session credentials in CreateSession
enable_trust_anchor	Enables a trust anchor
get_crl	Gets a certificate revocation list (CRL)
get_profile	Gets a profile
get_subject	Gets a Subject
get_trust_anchor	Gets a trust anchor

<code>import_crl</code>	Imports the certificate revocation list (CRL)
<code>list_crls</code>	Lists all Crls in the authenticated account and Amazon Web Services Region
<code>list_profiles</code>	Lists all profiles in the authenticated account and Amazon Web Services Region
<code>list_subjects</code>	Lists the subjects in the authenticated account and Amazon Web Services Region
<code>list_tags_for_resource</code>	Lists the tags attached to the resource
<code>list_trust_anchors</code>	Lists the trust anchors in the authenticated account and Amazon Web Services Region
<code>tag_resource</code>	Attaches tags to a resource
<code>untag_resource</code>	Removes tags from the resource
<code>update_crl</code>	Updates the certificate revocation list (CRL)
<code>update_profile</code>	Updates the profile
<code>update_trust_anchor</code>	Updates the trust anchor

Examples

```
## Not run:
svc <- iamrolesanywhere()
svc$create_profile(
  Foo = 123
)

## End(Not run)
```

identitystore

AWS SSO Identity Store

Description

The identity store service used by Amazon Web Services Single Sign On provides a single place to retrieve all of your identities (users and groups). For more information, see the [Amazon Web Services SSO User Guide](#).

Usage

```
identitystore(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.

- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to true to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- identitystore(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

describe_group	Retrieves the group metadata and attributes from <code>GroupId</code> in an identity store
describe_user	Retrieves the user metadata and attributes from <code>UserId</code> in an identity store
list_groups	Lists the attribute name and value of the group that you specified in the search
list_users	Lists the attribute name and value of the user that you specified in the search

Examples

```
## Not run:
svc <- identitystore()
```

```
svc$describe_group(  
  Foo = 123  
)  
  
## End(Not run)
```

inspector

Amazon Inspector

Description

Amazon Inspector enables you to analyze the behavior of your AWS resources and to identify potential security issues. For more information, see [Amazon Inspector User Guide](#).

Usage

```
inspector(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none">• access_key_id: AWS access key ID• secret_access_key: AWS secret access key• session_token: AWS temporary session token• profile: The name of a profile to use. If not given, then the default profile is used.• anonymous: Set anonymous credentials.• endpoint: The complete URL to use for the constructed client.• region: The AWS Region used in instantiating the client.• close_connection: Immediately close all HTTP connections.• timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.• s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```

svc <- inspector(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

```

Operations

add_attributes_to_findings	Assigns attributes (key and value pairs) to the findings that are specified by the ARNs of the findings
create_assessment_target	Creates a new assessment target using the ARN of the resource group that is generated by the assessment run
create_assessment_template	Creates an assessment template for the assessment target that is specified by the ARN of the assessment target
create_exclusions_preview	Starts the generation of an exclusions preview for the specified assessment template
create_resource_group	Creates a resource group using the specified set of tags (key and value pairs) that are used to identify the resources
delete_assessment_run	Deletes the assessment run that is specified by the ARN of the assessment run
delete_assessment_target	Deletes the assessment target that is specified by the ARN of the assessment target
delete_assessment_template	Deletes the assessment template that is specified by the ARN of the assessment template
describe_assessment_runs	Describes the assessment runs that are specified by the ARNs of the assessment runs
describe_assessment_targets	Describes the assessment targets that are specified by the ARNs of the assessment targets
describe_assessment_templates	Describes the assessment templates that are specified by the ARNs of the assessment templates
describe_cross_account_access_role	Describes the IAM role that enables Amazon Inspector to access your AWS account
describe_exclusions	Describes the exclusions that are specified by the exclusions' ARNs
describe_findings	Describes the findings that are specified by the ARNs of the findings
describe_resource_groups	Describes the resource groups that are specified by the ARNs of the resource groups
describe_rules_packages	Describes the rules packages that are specified by the ARNs of the rules packages
get_assessment_report	Produces an assessment report that includes detailed and comprehensive results of a scan
get_exclusions_preview	Retrieves the exclusions preview (a list of ExclusionPreview objects) specified by the ARNs of the exclusions
get_telemetry_metadata	Information about the data that is collected for the specified assessment run
list_assessment_run_agents	Lists the agents of the assessment runs that are specified by the ARNs of the assessment runs
list_assessment_runs	Lists the assessment runs that correspond to the assessment templates that are specified by the ARNs of the assessment templates
list_assessment_targets	Lists the ARNs of the assessment targets within this AWS account
list_assessment_templates	Lists the assessment templates that correspond to the assessment targets that are specified by the ARNs of the assessment targets
list_event_subscriptions	Lists all the event subscriptions for the assessment template that is specified by the ARN of the assessment template
list_exclusions	List exclusions that are generated by the assessment run
list_findings	Lists findings that are generated by the assessment runs that are specified by the ARNs of the assessment runs

list_rules_packages	Lists all available Amazon Inspector rules packages
list_tags_for_resource	Lists all tags associated with an assessment template
preview_agents	Previews the agents installed on the EC2 instances that are part of the specified assessment
register_cross_account_access_role	Registers the IAM role that grants Amazon Inspector access to AWS Services needed to perform an assessment
remove_attributes_from_findings	Removes entire attributes (key and value pairs) from the findings that are specified by the ARNs of the findings
set_tags_for_resource	Sets tags (key and value pairs) to the assessment template that is specified by the ARN of the assessment template
start_assessment_run	Starts the assessment run specified by the ARN of the assessment template
stop_assessment_run	Stops the assessment run that is specified by the ARN of the assessment run
subscribe_to_event	Enables the process of sending Amazon Simple Notification Service (SNS) notifications for the specified assessment run
unsubscribe_from_event	Disables the process of sending Amazon Simple Notification Service (SNS) notifications for the specified assessment run
update_assessment_target	Updates the assessment target that is specified by the ARN of the assessment target

Examples

```
## Not run:
svc <- inspector()
# Assigns attributes (key and value pairs) to the findings that are
# specified by the ARNs of the findings.
svc$add_attributes_to_findings(
  attributes = list(
    list(
      key = "Example",
      value = "example"
    )
  ),
  findingArns = list(
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-..."
  )
)

## End(Not run)
```

inspector2	<i>Inspector2</i>
------------	-------------------

Description

Amazon Inspector is a vulnerability discovery service that automates continuous scanning for security vulnerabilities within your Amazon EC2 and Amazon ECR environments.

Usage

```
inspector2(config = list())
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- inspector2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[associate_member](#)

Associates an Amazon Web Services account with an Amazon Inspector delegated admin

batch_get_account_status	Retrieves the Amazon Inspector status of multiple Amazon Web Services accounts with
batch_get_free_trial_info	Gets free trial status for multiple Amazon Web Services accounts
cancel_findings_report	Cancels the given findings report
create_filter	Creates a filter resource using specified filter criteria
create_findings_report	Creates a finding report
delete_filter	Deletes a filter resource
describe_organization_configuration	Describe Amazon Inspector configuration settings for an Amazon Web Services organization
disable	Disables Amazon Inspector scans for one or more Amazon Web Services accounts
disable_delegated_admin_account	Disables the Amazon Inspector delegated administrator for your organization
disassociate_member	Disassociates a member account from an Amazon Inspector delegated administrator
enable	Enables Amazon Inspector scans for one or more Amazon Web Services accounts
enable_delegated_admin_account	Enables the Amazon Inspector delegated administrator for your Organizations organization
get_configuration	Retrieves setting configurations for Inspector scans
get_delegated_admin_account	Retrieves information about the Amazon Inspector delegated administrator for your organization
get_findings_report_status	Gets the status of a findings report
get_member	Gets member information for your organization
list_account_permissions	Lists the permissions an account has to configure Amazon Inspector
list_coverage	Lists coverage details for your environment
list_coverage_statistics	Lists Amazon Inspector coverage statistics for your environment
list_delegated_admin_accounts	Lists information about the Amazon Inspector delegated administrator of your organization
list_filters	Lists the filters associated with your account
list_finding_aggregations	Lists aggregated finding data for your environment based on specific criteria
list_findings	Lists findings for your environment
list_members	List members associated with the Amazon Inspector delegated administrator for your organization
list_tags_for_resource	Lists all tags attached to a given resource
list_usage_totals	Lists the Amazon Inspector usage totals over the last 30 days
tag_resource	Adds tags to a resource
untag_resource	Removes tags from a resource
update_configuration	Updates setting configurations for your Amazon Inspector account
update_filter	Specifies the action that is to be applied to the findings that match the filter
update_organization_configuration	Updates the configurations for your Amazon Inspector organization

Examples

```
## Not run:
svc <- inspector2()
svc$associate_member(
  Foo = 123
)

## End(Not run)
```

Description

Key Management Service

Key Management Service (KMS) is an encryption and key management web service. This guide describes the KMS operations that you can call programmatically. For general information about KMS, see the [Key Management Service Developer Guide](#).

KMS is replacing the term *customer master key (CMK)* with *KMS key* and *KMS key*. The concept has not changed. To prevent breaking changes, KMS is keeping some variations of this term.

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, macOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to KMS and other Amazon Web Services services. For example, the SDKs take care of tasks such as signing requests (see below), managing errors, and retrying requests automatically. For more information about the Amazon Web Services SDKs, including how to download and install them, see [Tools for Amazon Web Services](#).

We recommend that you use the Amazon Web Services SDKs to make programmatic API calls to KMS.

If you need to use FIPS 140-2 validated cryptographic modules when communicating with Amazon Web Services, use the FIPS endpoint in your preferred Amazon Web Services Region. For more information about the available FIPS endpoints, see [Service endpoints](#) in the Key Management Service topic of the *Amazon Web Services General Reference*.

All KMS API calls must be signed and be transmitted using Transport Layer Security (TLS). KMS recommends you always use the latest supported TLS version. Clients must also support cipher suites with Perfect Forward Secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Signing Requests

Requests must be signed by using an access key ID and a secret access key. We strongly recommend that you *do not* use your Amazon Web Services account (root) access key ID and secret key for everyday work with KMS. Instead, use the access key ID and secret access key for an IAM user. You can also use the Amazon Web Services Security Token Service to generate temporary security credentials that you can use to sign requests.

All KMS operations require [Signature Version 4](#).

Logging API Requests

KMS supports CloudTrail, a service that logs Amazon Web Services API calls and related events for your Amazon Web Services account and delivers them to an Amazon S3 bucket that you specify. By using the information collected by CloudTrail, you can determine what requests were made to KMS, who made the request, when it was made, and so on. To learn more about CloudTrail, including how to turn it on and find your log files, see the [CloudTrail User Guide](#).

Additional Resources

For more information about credentials and request signing, see the following:

- [Amazon Web Services Security Credentials](#) - This topic provides general information about the types of credentials used to access Amazon Web Services.
- [Temporary Security Credentials](#) - This section of the *IAM User Guide* describes how to create and use temporary security credentials.
- [Signature Version 4 Signing Process](#) - This set of topics walks you through the process of signing a request using an access key ID and a secret access key.

Commonly Used API Operations

Of the API operations discussed in this guide, the following will prove the most useful for most applications. You will likely perform operations other than these, such as creating keys and assigning policies, by using the console.

- [encrypt](#)
- [decrypt](#)
- [generate_data_key](#)
- [generate_data_key_without_plaintext](#)

Usage

```
kms(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```

svc <- kms(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

```

Operations

cancel_key_deletion	Cancels the deletion of a KMS key
connect_custom_key_store	Connects or reconnects a custom key store to its associated CloudHSM cluster
create_alias	Creates a friendly name for a KMS key
create_custom_key_store	Creates a custom key store that is associated with an CloudHSM cluster that you
create_grant	Adds a grant to a KMS key
create_key	Creates a unique customer managed KMS key in your Amazon Web Services acc
decrypt	Decrypts ciphertext that was encrypted by a KMS key using any of the following
delete_alias	Deletes the specified alias
delete_custom_key_store	Deletes a custom key store
delete_imported_key_material	Deletes key material that you previously imported
describe_custom_key_stores	Gets information about custom key stores in the account and Region
describe_key	Provides detailed information about a KMS key
disable_key	Sets the state of a KMS key to disabled
disable_key_rotation	Disables automatic rotation of the key material of the specified symmetric encryp
disconnect_custom_key_store	Disconnects the custom key store from its associated CloudHSM cluster
enable_key	Sets the key state of a KMS key to enabled
enable_key_rotation	Enables automatic rotation of the key material of the specified symmetric encryp
encrypt	Encrypts plaintext of up to 4,096 bytes using a KMS key
generate_data_key	Returns a unique symmetric data key for use outside of KMS
generate_data_key_pair	Returns a unique asymmetric data key pair for use outside of KMS
generate_data_key_pair_without_plaintext	Returns a unique asymmetric data key pair for use outside of KMS
generate_data_key_without_plaintext	Returns a unique symmetric data key for use outside of KMS
generate_mac	Generates a hash-based message authentication code (HMAC) for a message usin
generate_random	Returns a random byte string that is cryptographically secure
get_key_policy	Gets a key policy attached to the specified KMS key
get_key_rotation_status	Gets a Boolean value that indicates whether automatic rotation of the key materi

get_parameters_for_import	Returns the items you need to import key material into a symmetric encryption K
get_public_key	Returns the public key of an asymmetric KMS key
import_key_material	Imports key material into an existing symmetric encryption KMS key that was cr
list_aliases	Gets a list of aliases in the caller's Amazon Web Services account and region
list_grants	Gets a list of all grants for the specified KMS key
list_key_policies	Gets the names of the key policies that are attached to a KMS key
list_keys	Gets a list of all KMS keys in the caller's Amazon Web Services account and Re
list_resource_tags	Returns all tags on the specified KMS key
list_retirable_grants	Returns information about all grants in the Amazon Web Services account and R
put_key_policy	Attaches a key policy to the specified KMS key
re_encrypt	Decrypts ciphertext and then reencrypts it entirely within KMS
replicate_key	Replicates a multi-Region key into the specified Region
retire_grant	Deletes a grant
revoke_grant	Deletes the specified grant
schedule_key_deletion	Schedules the deletion of a KMS key
sign	Creates a digital signature for a message or message digest by using the private k
tag_resource	Adds or edits tags on a customer managed key
untag_resource	Deletes tags from a customer managed key
update_alias	Associates an existing KMS alias with a different KMS key
update_custom_key_store	Changes the properties of a custom key store
update_key_description	Updates the description of a KMS key
update_primary_region	Changes the primary key of a multi-Region key
verify	Verifies a digital signature that was generated by the Sign operation
verify_mac	Verifies the hash-based message authentication code (HMAC) for a specified me

Examples

```
## Not run:
svc <- kms()
# The following example cancels deletion of the specified KMS key.
svc$cancel_key_deletion(
  KeyId = "1234abcd-12ab-34cd-56ef-1234567890ab"
)

## End(Not run)
```

macie

Amazon Macie

Description

Amazon Macie Classic

Amazon Macie Classic has been discontinued and is no longer available.

A new Amazon Macie is now available with significant design improvements and additional features, at a lower price and in most Amazon Web Services Regions. We encourage you to take advantage of the new and improved features, and benefit from the reduced cost. To learn about features and pricing for the new Macie, see [Amazon Macie](#). To learn how to use the new Macie, see the [Amazon Macie User Guide](#).

Usage

```
macie(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- macie(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
```

```

        close_connection = "logical",
        timeout = "numeric",
        s3_force_path_style = "logical"
    )
)

```

Operations

associate_member_account	(Discontinued) Associates a specified Amazon Web Services account with Amazon Macie Classic
associate_s3_resources	(Discontinued) Associates specified S3 resources with Amazon Macie Classic for monitoring
disassociate_member_account	(Discontinued) Removes the specified member account from Amazon Macie Classic
disassociate_s3_resources	(Discontinued) Removes specified S3 resources from being monitored by Amazon Macie Classic
list_member_accounts	(Discontinued) Lists all Amazon Macie Classic member accounts for the current Macie Classic
list_s3_resources	(Discontinued) Lists all the S3 resources associated with Amazon Macie Classic
update_s3_resources	(Discontinued) Updates the classification types for the specified S3 resources

Examples

```

## Not run:
svc <- macie()
svc$associate_member_account(
  Foo = 123
)

## End(Not run)

```

macie2

Amazon Macie 2

Description

Amazon Macie is a fully managed data security and data privacy service that uses machine learning and pattern matching to discover and protect your sensitive data in AWS. Macie automates the discovery of sensitive data, such as PII and intellectual property, to provide you with insight into the data that your organization stores in AWS. Macie also provides an inventory of your Amazon S3 buckets, which it continually monitors for you. If Macie detects sensitive data or potential data access issues, it generates detailed findings for you to review and act upon as necessary.

Usage

```
macie2(config = list())
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- macie2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[accept_invitation](#)

Accepts an Amazon Macie membership invitation that was received from a spe

batch_get_custom_data_identifiers	Retrieves information about one or more custom data identifiers
create_classification_job	Creates and defines the settings for a classification job
create_custom_data_identifier	Creates and defines the criteria and other settings for a custom data identifier
create_findings_filter	Creates and defines the criteria and other settings for a findings filter
create_invitations	Sends an Amazon Macie membership invitation to one or more accounts
create_member	Associates an account with an Amazon Macie administrator account
create_sample_findings	Creates sample findings
decline_invitations	Declines Amazon Macie membership invitations that were received from specific accounts
delete_custom_data_identifier	Soft deletes a custom data identifier
delete_findings_filter	Deletes a findings filter
delete_invitations	Deletes Amazon Macie membership invitations that were received from specific accounts
delete_member	Deletes the association between an Amazon Macie administrator account and a member account
describe_buckets	Retrieves (queries) statistical data and other information about one or more S3 buckets
describe_classification_job	Retrieves the status and settings for a classification job
describe_organization_configuration	Retrieves the Amazon Macie configuration settings for an organization in Organization
disable_macie	Disables Amazon Macie and deletes all settings and resources for a Macie account
disable_organization_admin_account	Disables an account as the delegated Amazon Macie administrator account for an organization
disassociate_from_administrator_account	Disassociates a member account from its Amazon Macie administrator account
disassociate_from_master_account	(Deprecated) Disassociates a member account from its Amazon Macie administrator account
disassociate_member	Disassociates an Amazon Macie administrator account from a member account
enable_macie	Enables Amazon Macie and specifies the configuration settings for a Macie account
enable_organization_admin_account	Designates an account as the delegated Amazon Macie administrator account for an organization
get_administrator_account	Retrieves information about the Amazon Macie administrator account for an account
get_bucket_statistics	Retrieves (queries) aggregated statistical data about S3 buckets that Amazon Macie has scanned
get_classification_export_configuration	Retrieves the configuration settings for storing data classification results
get_custom_data_identifier	Retrieves the criteria and other settings for a custom data identifier
get_findings	Retrieves the details of one or more findings
get_findings_filter	Retrieves the criteria and other settings for a findings filter
get_findings_publication_configuration	Retrieves the configuration settings for publishing findings to Security Hub
get_finding_statistics	Retrieves (queries) aggregated statistical data about findings
get_invitations_count	Retrieves the count of Amazon Macie membership invitations that were received from specific accounts
get_macie_session	Retrieves the current status and configuration settings for an Amazon Macie account
get_master_account	(Deprecated) Retrieves information about the Amazon Macie administrator account for an organization
get_member	Retrieves information about an account that's associated with an Amazon Macie administrator account
get_reveal_configuration	Retrieves the status and configuration settings for retrieving (revealing) occurrences of sensitive data
get_sensitive_data_occurrences	Retrieves (reveals) occurrences of sensitive data reported by a finding
get_sensitive_data_occurrences_availability	Checks whether occurrences of sensitive data can be retrieved (revealed) for a finding
get_usage_statistics	Retrieves (queries) quotas and aggregated usage data for one or more accounts
get_usage_totals	Retrieves (queries) aggregated usage data for an account
list_classification_jobs	Retrieves a subset of information about one or more classification jobs
list_custom_data_identifiers	Retrieves a subset of information about all the custom data identifiers for an account
list_findings	Retrieves a subset of information about one or more findings
list_findings_filters	Retrieves a subset of information about all the findings filters for an account
list_invitations	Retrieves information about the Amazon Macie membership invitations that were received from specific accounts
list_managed_data_identifiers	Retrieves information about all the managed data identifiers that Amazon Macie has scanned
list_members	Retrieves information about the accounts that are associated with an Amazon Macie administrator account
list_organization_admin_accounts	Retrieves information about the delegated Amazon Macie administrator accounts for an organization
list_tags_for_resource	Retrieves the tags (keys and values) that are associated with a classification job

put_classification_export_configuration	Creates or updates the configuration settings for storing data classification results
put_findings_publication_configuration	Updates the configuration settings for publishing findings to Security Hub
search_resources	Retrieves (queries) statistical data and other information about Amazon Web Services resources
tag_resource	Adds or updates one or more tags (keys and values) that are associated with a resource
test_custom_data_identifier	Tests a custom data identifier
untag_resource	Removes one or more tags (keys and values) from a classification job, custom data identifier, or findings filter
update_classification_job	Changes the status of a classification job
update_findings_filter	Updates the criteria and other settings for a findings filter
update_macie_session	Suspends or re-enables Amazon Macie, or updates the configuration settings for Amazon Macie
update_member_session	Enables an Amazon Macie administrator to suspend or re-enable Macie for a member account
update_organization_configuration	Updates the Amazon Macie configuration settings for an organization in Organizations
update_reveal_configuration	Updates the status and configuration settings for retrieving (revealing) occurrences

Examples

```
## Not run:
svc <- macie2()
svc$accept_invitation(
  Foo = 123
)

## End(Not run)
```

ram

AWS Resource Access Manager

Description

This is the *Resource Access Manager API Reference*. This documentation provides descriptions and syntax for each of the actions and data types in RAM. RAM is a service that helps you securely share your Amazon Web Services resources across Amazon Web Services accounts. If you have multiple Amazon Web Services accounts, you can use RAM to share those resources with other accounts. If you use Organizations to manage your accounts, then you share your resources with your organization or organizational units (OUs). For supported resource types, you can also share resources with individual Identity and Access Management (IAM) roles and users.

To learn more about RAM, see the following resources:

- [Resource Access Manager product page](#)
- [Resource Access Manager User Guide](#)

Usage

```
ram(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ram(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[accept_resource_share_invitation](#)

Accepts an invitation to a resource share from another Amazon Web Service.

<code>associate_resource_share</code>	Adds the specified list of principals and list of resources to a resource share
<code>associate_resource_share_permission</code>	Adds or replaces the RAM permission for a resource type included in a resource share
<code>create_resource_share</code>	Creates a resource share
<code>delete_resource_share</code>	Deletes the specified resource share
<code>disassociate_resource_share</code>	Disassociates the specified principals or resources from the specified resource share
<code>disassociate_resource_share_permission</code>	Disassociates an RAM permission from a resource share
<code>enable_sharing_with_aws_organization</code>	Enables resource sharing within your organization in Organizations
<code>get_permission</code>	Gets the contents of an RAM permission in JSON format
<code>get_resource_policies</code>	Retrieves the resource policies for the specified resources that you own and have access to
<code>get_resource_share_associations</code>	Retrieves the resource and principal associations for resource shares that you own or that are shared with you
<code>get_resource_share_invitations</code>	Retrieves details about invitations that you have received for resource shares
<code>get_resource_shares</code>	Retrieves details about the resource shares that you own or that are shared with you
<code>list_pending_invitation_resources</code>	Lists the resources in a resource share that is shared with you but for which there are no pending invitations
<code>list_permissions</code>	Retrieves a list of available RAM permissions that you can use for the supported resource types
<code>list_permission_versions</code>	Lists the available versions of the specified RAM permission
<code>list_principals</code>	Lists the principals that you are sharing resources with or that are sharing resources with you
<code>list_resources</code>	Lists the resources that you added to a resource share or the resources that are shared with you
<code>list_resource_share_permissions</code>	Lists the RAM permissions that are associated with a resource share
<code>list_resource_types</code>	Lists the resource types that can be shared by RAM
<code>promote_resource_share_created_from_policy</code>	When you attach a resource-based permission policy to a resource, it automatically creates a resource share
<code>reject_resource_share_invitation</code>	Rejects an invitation to a resource share from another Amazon Web Services account
<code>tag_resource</code>	Adds the specified tag keys and values to the specified resource share
<code>untag_resource</code>	Removes the specified tag key and value pairs from the specified resource share
<code>update_resource_share</code>	Modifies some of the properties of the specified resource share

Examples

```
## Not run:
svc <- ram()
svc$accept_resource_share_invitation(
  Foo = 123
)

## End(Not run)
```

secretsmanager

AWS Secrets Manager

Description

Amazon Web Services Secrets Manager

Amazon Web Services Secrets Manager provides a service to enable you to store, manage, and retrieve, secrets.

This guide provides descriptions of the Secrets Manager API. For more information about using this service, see the [Amazon Web Services Secrets Manager User Guide](#).

API Version

This version of the Secrets Manager API Reference documents the Secrets Manager API version 2017-10-17.

Support and Feedback for Amazon Web Services Secrets Manager

We welcome your feedback. Send your comments to awssecretsmanager-feedback@amazon.com, or post your feedback and questions in the [Amazon Web Services Secrets Manager Discussion Forum](#). For more information about the Amazon Web Services Discussion Forums, see [Forums Help](#).

Logging API Requests

Amazon Web Services Secrets Manager supports Amazon Web Services CloudTrail, a service that records Amazon Web Services API calls for your Amazon Web Services account and delivers log files to an Amazon S3 bucket. By using information that's collected by Amazon Web Services CloudTrail, you can determine the requests successfully made to Secrets Manager, who made the request, when it was made, and so on. For more about Amazon Web Services Secrets Manager and support for Amazon Web Services CloudTrail, see [Logging Amazon Web Services Secrets Manager Events with Amazon Web Services CloudTrail](#) in the *Amazon Web Services Secrets Manager User Guide*. To learn more about CloudTrail, including enabling it and find your log files, see the [Amazon Web Services CloudTrail User Guide](#).

Usage

```
secretsmanager(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the [Operations](#) section.

Service syntax

```

svc <- secretsmanager(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

```

Operations

cancel_rotate_secret	Turns off automatic rotation, and if a rotation is currently in progress, cancels the rotation
create_secret	Creates a new secret
delete_resource_policy	Deletes the resource-based permission policy attached to the secret
delete_secret	Deletes a secret and all of its versions
describe_secret	Retrieves the details of a secret
get_random_password	Generates a random password
get_resource_policy	Retrieves the JSON text of the resource-based policy document attached to the secret
get_secret_value	Retrieves the contents of the encrypted fields SecretString or SecretBinary from the secret
list_secrets	Lists the secrets that are stored by Secrets Manager in the Amazon Web Services account
list_secret_version_ids	Lists the versions of a secret
put_resource_policy	Attaches a resource-based permission policy to a secret
put_secret_value	Creates a new version with a new encrypted secret value and attaches it to the secret
remove_regions_from_replication	For a secret that is replicated to other Regions, deletes the secret replicas from the Region
replicate_secret_to_regions	Replicates the secret to a new Regions
restore_secret	Cancels the scheduled deletion of a secret by removing the DeletedDate time stamp
rotate_secret	Configures and starts the asynchronous process of rotating the secret
stop_replication_to_replica	Removes the link between the replica secret and the primary secret and promotes the replica
tag_resource	Attaches tags to a secret
untag_resource	Removes specific tags from a secret
update_secret	Modifies the details of a secret, including metadata and the secret value
update_secret_version_stage	Modifies the staging labels attached to a version of a secret
validate_resource_policy	Validates that a resource policy does not grant a wide range of principals access to your secret

Examples

```
## Not run:
svc <- secretsmanager()
# The following example shows how to cancel rotation for a secret. The
# operation sets the RotationEnabled field to false and cancels all
# scheduled rotations. To resume scheduled rotations, you must re-enable
# rotation by calling the rotate-secret operation.
svc$cancel_rotate_secret(
  SecretId = "MyTestDatabaseSecret"
)

## End(Not run)
```

securityhub

AWS SecurityHub

Description

Security Hub provides you with a comprehensive view of the security state of your Amazon Web Services environment and resources. It also provides you with the readiness status of your environment based on controls from supported security standards. Security Hub collects security data from Amazon Web Services accounts, services, and integrated third-party products and helps you analyze security trends in your environment to identify the highest priority security issues. For more information about Security Hub, see the [Security Hub User Guide](#).

When you use operations in the Security Hub API, the requests are executed only in the Amazon Web Services Region that is currently active or in the specific Amazon Web Services Region that you specify in your request. Any configuration or settings change that results from the operation is applied only to that Region. To make the same change in other Regions, execute the same command for each Region to apply the change to.

For example, if your Region is set to us-west-2, when you use [create_members](#) to add a member account to Security Hub, the association of the member account with the administrator account is created only in the us-west-2 Region. Security Hub must be enabled for the member account in the same Region that the invitation was sent from.

The following throttling limits apply to using Security Hub API operations.

- [batch_enable_standards](#) - RateLimit of 1 request per second, BurstLimit of 1 request per second.
- [get_findings](#) - RateLimit of 3 requests per second. BurstLimit of 6 requests per second.
- [batch_import_findings](#) - RateLimit of 10 requests per second. BurstLimit of 30 requests per second.
- [batch_update_findings](#) - RateLimit of 10 requests per second. BurstLimit of 30 requests per second.
- [update_standards_control](#) - RateLimit of 1 request per second, BurstLimit of 5 requests per second.
- All other operations - RateLimit of 10 requests per second. BurstLimit of 30 requests per second.

Usage

```
securityhub(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- **anonymous**: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- **region**: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- securityhub(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

<code>accept_administrator_invitation</code>	Accepts the invitation to be a member account and be monitored by the Security Hub administrator account
<code>accept_invitation</code>	This method is deprecated
<code>batch_disable_standards</code>	Disables the standards specified by the provided <code>StandardsSubscriptionArns</code>
<code>batch_enable_standards</code>	Enables the standards specified by the provided <code>StandardsArn</code>
<code>batch_import_findings</code>	Imports security findings generated by a finding provider into Security Hub
<code>batch_update_findings</code>	Used by Security Hub customers to update information about their investigation in Security Hub
<code>create_action_target</code>	Creates a custom action target in Security Hub
<code>create_finding_aggregator</code>	Used to enable finding aggregation
<code>create_insight</code>	Creates a custom insight in Security Hub
<code>create_members</code>	Creates a member association in Security Hub between the specified accounts and the administrator account
<code>decline_invitations</code>	Declines invitations to become a member account
<code>delete_action_target</code>	Deletes a custom action target from Security Hub
<code>delete_finding_aggregator</code>	Deletes a finding aggregator
<code>delete_insight</code>	Deletes the insight specified by the <code>InsightArn</code>
<code>delete_invitations</code>	Deletes invitations received by the Amazon Web Services account to become a member account
<code>delete_members</code>	Deletes the specified member accounts from Security Hub
<code>describe_action_targets</code>	Returns a list of the custom action targets in Security Hub in your account
<code>describe_hub</code>	Returns details about the Hub resource in your account, including the <code>HubArn</code> and <code>Region</code>
<code>describe_organization_configuration</code>	Returns information about the Organizations configuration for Security Hub
<code>describe_products</code>	Returns information about product integrations in Security Hub
<code>describe_standards</code>	Returns a list of the available standards in Security Hub
<code>describe_standards_controls</code>	Returns a list of security standards controls
<code>disable_import_findings_for_product</code>	Disables the integration of the specified product with Security Hub
<code>disable_organization_admin_account</code>	Disables a Security Hub administrator account
<code>disable_security_hub</code>	Disables Security Hub in your account only in the current Region
<code>disassociate_from_administrator_account</code>	Disassociates the current Security Hub member account from the associated administrator account
<code>disassociate_from_master_account</code>	This method is deprecated
<code>disassociate_members</code>	Disassociates the specified member accounts from the associated administrator account
<code>enable_import_findings_for_product</code>	Enables the integration of a partner product with Security Hub
<code>enable_organization_admin_account</code>	Designates the Security Hub administrator account for an organization
<code>enable_security_hub</code>	Enables Security Hub for your account in the current Region or the Region you specify
<code>get_administrator_account</code>	Provides the details for the Security Hub administrator account for the current member account
<code>get_enabled_standards</code>	Returns a list of the standards that are currently enabled
<code>get_finding_aggregator</code>	Returns the current finding aggregation configuration
<code>get_findings</code>	Returns a list of findings that match the specified criteria
<code>get_insight_results</code>	Lists the results of the Security Hub insight specified by the insight ARN
<code>get_insights</code>	Lists and describes insights for the specified insight ARNs
<code>get_invitations_count</code>	Returns the count of all Security Hub membership invitations that were sent to the current member account
<code>get_master_account</code>	This method is deprecated
<code>get_members</code>	Returns the details for the Security Hub member accounts for the specified administrator account
<code>invite_members</code>	Invites other Amazon Web Services accounts to become member accounts for the current administrator account
<code>list_enabled_products_for_import</code>	Lists all findings-generating solutions (products) that you are subscribed to receive findings from
<code>list_finding_aggregators</code>	If finding aggregation is enabled, then <code>ListFindingAggregators</code> returns the ARN of the finding aggregator
<code>list_invitations</code>	Lists all Security Hub membership invitations that were sent to the current Amazon Web Services account
<code>list_members</code>	Lists details about all member accounts for the current Security Hub administrator account
<code>list_organization_admin_accounts</code>	Lists the Security Hub administrator accounts

list_tags_for_resource	Returns a list of tags associated with a resource
tag_resource	Adds one or more tags to a resource
untag_resource	Removes one or more tags from a resource
update_action_target	Updates the name and description of a custom action target in Security Hub
update_finding_aggregator	Updates the finding aggregation configuration
update_findings	UpdateFindings is deprecated
update_insight	Updates the Security Hub insight identified by the specified insight ARN
update_organization_configuration	Used to update the configuration related to Organizations
update_security_hub_configuration	Updates configuration options for Security Hub
update_standards_control	Used to control whether an individual security standard control is enabled or disabled

Examples

```
## Not run:
svc <- securityhub()
svc$accept_administrator_invitation(
  Foo = 123
)

## End(Not run)
```

shield

AWS Shield

Description

Shield Advanced

This is the *Shield Advanced API Reference*. This guide is for developers who need detailed information about the Shield Advanced API actions, data types, and errors. For detailed information about WAF and Shield Advanced features and an overview of how to use the WAF and Shield Advanced APIs, see the [WAF and Shield Developer Guide](#).

Usage

```
shield(config = list())
```

Arguments

config Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.

- **anonymous:** Set anonymous credentials.
- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- shield(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

list_protections	Retrieves Protection objects for the account
list_resources_in_protection_group	Retrieves the resources that are included in the protection group
list_tags_for_resource	Gets information about Amazon Web Services tags for a specified Amazon Resource Name
tag_resource	Adds or updates tags for a resource in Shield
untag_resource	Removes tags from a resource in Shield
update_application_layer_automatic_response	Updates an existing Shield Advanced automatic application layer DDoS mitigation for a resource
update_emergency_contact_settings	Updates the details of the list of email addresses and phone numbers that the Shield Response Team uses to contact you
update_protection_group	Updates an existing protection group
update_subscription	Updates the details of an existing subscription

Examples

```
## Not run:
svc <- shield()
svc$associate_drt_log_bucket(
  Foo = 123
)

## End(Not run)
```

Description

Amazon Web Services Single Sign On Portal is a web service that makes it easy for you to assign user access to Amazon Web Services SSO resources such as the AWS access portal. Users can get

Amazon Web Services account applications and roles assigned to them and get federated into the application.

Although Amazon Web Services Single Sign-On was renamed, the `sso` and `identitystore` API namespaces will continue to retain their original name for backward compatibility purposes. For more information, see [Amazon Web Services SSO rename](#).

This API reference guide describes the Amazon Web Services SSO Portal operations that you can call programmatically and includes detailed information on data types and errors.

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms, such as Java, Ruby, .Net, iOS, or Android. The SDKs provide a convenient way to create programmatic access to Amazon Web Services SSO and other Amazon Web Services services. For more information about the Amazon Web Services SDKs, including how to download and install them, see [Tools for Amazon Web Services](#).

Usage

```
sso(config = list())
```

Arguments

<code>config</code>	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
---------------------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- sso(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
```

```

        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
),
endpoint = "string",
region = "string",
close_connection = "logical",
timeout = "numeric",
s3_force_path_style = "logical"
)
)

```

Operations

get_role_credentials	Returns the STS short-term credentials for a given role name that is assigned to the user
list_account_roles	Lists all roles that are assigned to the user for a given Amazon Web Services account
list_accounts	Lists all Amazon Web Services accounts assigned to the user
logout	Removes the locally stored SSO tokens from the client-side cache and sends an API call to the Amazon

Examples

```

## Not run:
svc <- sso()
svc$get_role_credentials(
  Foo = 123
)

## End(Not run)

```

ssoadmin

AWS Single Sign-On Admin

Description

AWS Single Sign-On Admin

Usage

```
ssoadmin(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ssoadmin(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

[attach_customer_managed_policy_reference_to_permission_set](#)

Attaches the specified customer managed policy to the s

<code>attach_managed_policy_to_permission_set</code>	Attaches an Amazon Web Services managed policy ARN to a specified Amazon Web Services managed policy reference in a specified permission set
<code>create_account_assignment</code>	Assigns access to a principal for a specified Amazon Web Services account and a specified Amazon Web Services managed policy reference in a specified permission set
<code>create_instance_access_control_attribute_configuration</code>	Enables the attributes-based access control (ABAC) feature for a specified Amazon Web Services SSO instance
<code>create_permission_set</code>	Creates a permission set within a specified Amazon Web Services SSO instance
<code>delete_account_assignment</code>	Deletes a principal's access from a specified Amazon Web Services account and a specified Amazon Web Services managed policy reference in a specified permission set
<code>delete_inline_policy_from_permission_set</code>	Deletes the inline policy from a specified permission set
<code>delete_instance_access_control_attribute_configuration</code>	Disables the attributes-based access control (ABAC) feature for a specified Amazon Web Services SSO instance
<code>delete_permissions_boundary_from_permission_set</code>	Deletes the permissions boundary from a specified PermissionSet
<code>delete_permission_set</code>	Deletes the specified permission set
<code>describe_account_assignment_creation_status</code>	Describes the status of the assignment creation request
<code>describe_account_assignment_deletion_status</code>	Describes the status of the assignment deletion request
<code>describe_instance_access_control_attribute_configuration</code>	Returns the list of Amazon Web Services SSO identity store attributes
<code>describe_permission_set</code>	Gets the details of the permission set
<code>describe_permission_set_provisioning_status</code>	Describes the status for the given permission set provisioning request
<code>detach_customer_managed_policy_reference_from_permission_set</code>	Detaches the specified customer managed policy from the specified permission set
<code>detach_managed_policy_from_permission_set</code>	Detaches the attached Amazon Web Services managed policy from the specified permission set
<code>get_inline_policy_for_permission_set</code>	Obtains the inline policy assigned to the permission set
<code>get_permissions_boundary_for_permission_set</code>	Obtains the permissions boundary for a specified PermissionSet
<code>list_account_assignment_creation_status</code>	Lists the status of the Amazon Web Services account assignment creation request
<code>list_account_assignment_deletion_status</code>	Lists the status of the Amazon Web Services account assignment deletion request
<code>list_account_assignments</code>	Lists the assignee of the specified Amazon Web Services account and a specified Amazon Web Services managed policy reference in a specified permission set
<code>list_accounts_for_provisioned_permission_set</code>	Lists all the Amazon Web Services accounts where the specified Amazon Web Services managed policy reference is attached in a specified permission set
<code>list_customer_managed_policy_references_in_permission_set</code>	Lists all customer managed policies attached to a specified permission set
<code>list_instances</code>	Lists the Amazon Web Services SSO instances that the specified Amazon Web Services managed policy reference is attached to
<code>list_managed_policies_in_permission_set</code>	Lists the Amazon Web Services managed policy that is attached to the specified permission set
<code>list_permission_set_provisioning_status</code>	Lists the status of the permission set provisioning request
<code>list_permission_sets</code>	Lists the PermissionSets in an Amazon Web Services SSO instance
<code>list_permission_sets_provisioned_to_account</code>	Lists all the permission sets that are provisioned to a specified Amazon Web Services account
<code>list_tags_for_resource</code>	Lists the tags that are attached to a specified resource
<code>provision_permission_set</code>	The process by which a specified permission set is provisioned
<code>put_inline_policy_to_permission_set</code>	Attaches an inline policy to a permission set
<code>put_permissions_boundary_to_permission_set</code>	Attaches an Amazon Web Services managed or customer managed policy as a permissions boundary to a specified PermissionSet
<code>tag_resource</code>	Associates a set of tags with a specified resource
<code>untag_resource</code>	Disassociates a set of tags from a specified resource
<code>update_instance_access_control_attribute_configuration</code>	Updates the Amazon Web Services SSO identity store attributes
<code>update_permission_set</code>	Updates an existing permission set

Examples

```
## Not run:
svc <- ssoadmin()
svc$attach_customer_managed_policy_reference_to_permission_set(
  Foo = 123
)

## End(Not run)
```

`ssooidc`*AWS SSO OIDC*

Description

Amazon Web Services Single Sign On OpenID Connect (OIDC) is a web service that enables a client (such as Amazon Web Services CLI or a native application) to register with Amazon Web Services SSO. The service also enables the client to fetch the user's access token upon successful authentication and authorization with Amazon Web Services SSO.

Although Amazon Web Services Single Sign-On was renamed, the `sso` and `identitystore` API namespaces will continue to retain their original name for backward compatibility purposes. For more information, see [Amazon Web Services SSO rename](#).

Considerations for Using This Guide

Before you begin using this guide, we recommend that you first review the following important information about how the Amazon Web Services SSO OIDC service works.

- The Amazon Web Services SSO OIDC service currently implements only the portions of the OAuth 2.0 Device Authorization Grant standard (<https://tools.ietf.org/html/rfc8628>) that are necessary to enable single sign-on authentication with the AWS CLI. Support for other OIDC flows frequently needed for native applications, such as Authorization Code Flow (+ PKCE), will be addressed in future releases.
- The service emits only OIDC access tokens, such that obtaining a new token (For example, token refresh) requires explicit user re-authentication.
- The access tokens provided by this service grant access to all AWS account entitlements assigned to an Amazon Web Services SSO user, not just a particular application.
- The documentation in this guide does not describe the mechanism to convert the access token into AWS Auth (“sigv4”) credentials for use with IAM-protected AWS service endpoints. For more information, see [GetRoleCredentials](#) in the *Amazon Web Services SSO Portal API Reference Guide*.

For general information about Amazon Web Services SSO, see [What is Amazon Web Services SSO?](#) in the *Amazon Web Services SSO User Guide*.

Usage

```
ssooidc(config = list())
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **access_key_id**: AWS access key ID
- **secret_access_key**: AWS secret access key
- **session_token**: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.

- **anonymous:** Set anonymous credentials.
- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to `true` to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ssooidc(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)
```

Operations

create_token	Creates and returns an access token for the authorized client
register_client	Registers a client with Amazon Web Services SSO
start_device_authorization	Initiates device authorization by requesting a pair of verification codes from the authorization server

Examples

```
## Not run:
svc <- ssooidc()
```

```

svc$create_token(
  Foo = 123
)

## End(Not run)

```

 sts

 AWS Security Token Service

Description

Security Token Service

Security Token Service (STS) enables you to request temporary, limited-privilege credentials for Identity and Access Management (IAM) users or for users that you authenticate (federated users). This guide provides descriptions of the STS API. For more information about using this service, see [Temporary Security Credentials](#).

Usage

```
sts(config = list())
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```

svc <- sts(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

```

Operations

assume_role	Returns a set of temporary security credentials that you can use to access Amazon Web Services.
assume_role_with_saml	Returns a set of temporary security credentials for users who have been authenticated via a SAML assertion.
assume_role_with_web_identity	Returns a set of temporary security credentials for users who have been authenticated in a web browser.
decode_authorization_message	Decodes additional information about the authorization status of a request from an encoded authorization message.
get_access_key_info	Returns the account identifier for the specified access key ID.
get_caller_identity	Returns details about the IAM user or role whose credentials are used to call the operation.
get_federation_token	Returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a session token).
get_session_token	Returns a set of temporary credentials for an Amazon Web Services account or IAM user.

Examples

```

## Not run:
svc <- sts()
#
svc$assume_role(
  ExternalId = "123ABC",
  Policy = "{\n\"Version\": \"2012-10-17\", \"Statement\": [{\n\"Sid\": \"Stmnt1\", \"Effect\": \"A...\",
  RoleArn = \"arn:aws:iam::123456789012:role/demo\",
  RoleSessionName = \"testAssumeRoleSession\",
  Tags = list(
    list(
      Key = \"Project\",
      Value = \"Unicorn\"
    ),
    list(

```

```

        Key = "Team",
        Value = "Automation"
    ),
    list(
        Key = "Cost-Center",
        Value = "12345"
    )
),
TransitiveTagKeys = list(
    "Project",
    "Cost-Center"
)
)

## End(Not run)

```

waf

AWS WAF

Description

This is **AWS WAF Classic** documentation. For more information, see [AWS WAF Classic](#) in the developer guide.

For the latest version of AWS WAF, use the AWS WAFV2 API and see the [AWS WAF Developer Guide](#). With the latest version, AWS WAF has a single set of endpoints for regional and global use.

This is the *AWS WAF Classic API Reference* for using AWS WAF Classic with Amazon CloudFront. The AWS WAF Classic actions and data types listed in the reference are available for protecting Amazon CloudFront distributions. You can use these actions and data types via the endpoint *waf.amazonaws.com*. This guide is for developers who need detailed information about the AWS WAF Classic API actions, data types, and errors. For detailed information about AWS WAF Classic features and an overview of how to use the AWS WAF Classic API, see the [AWS WAF Classic](#) in the developer guide.

Usage

```
waf(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
--------	--

- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to true to force the request to use path-style addressing, i.e., `http://s3.amazonaws.com/BUCKET/KEY`.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- waf(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical"
  )
)

wafregional

AWS WAF Regional

Description

This is **AWS WAF Classic Regional** documentation. For more information, see [AWS WAF Classic](#) in the developer guide.

For the latest version of AWS WAF, use the AWS WAFV2 API and see the [AWS WAF Developer Guide](#). With the latest version, AWS WAF has a single set of endpoints for regional and global use.

This is the *AWS WAF Regional Classic API Reference* for using AWS WAF Classic with the AWS resources, Elastic Load Balancing (ELB) Application Load Balancers and API Gateway APIs. The AWS WAF Classic actions and data types listed in the reference are available for protecting Elastic Load Balancing (ELB) Application Load Balancers and API Gateway APIs. You can use these

actions and data types by means of the endpoints listed in [AWS Regions and Endpoints](#). This guide is for developers who need detailed information about the AWS WAF Classic API actions, data types, and errors. For detailed information about AWS WAF Classic features and an overview of how to use the AWS WAF Classic API, see the [AWS WAF Classic](#) in the developer guide.

Usage

```
wafregional(config = list())
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	--

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- wafregional(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
```

```

        timeout = "numeric",
        s3_force_path_style = "logical"
    )
)

```

Name = "MyIPSetFriendlyName"  
)  
  
## End(Not run)
```

wafv2

AWS WAFV2

Description

WAF

This is the latest version of the **WAF** API, released in November, 2019. The names of the entities that you use to access this API, like endpoints and namespaces, all have the versioning information added, like "V2" or "v2", to distinguish from the prior version. We recommend migrating your resources to this version, because it has a number of significant improvements.

If you used WAF prior to this release, you can't use this WAFV2 API to access any WAF resources that you created before. You can access your old rules, web ACLs, and other WAF resources only through the WAF Classic APIs. The WAF Classic APIs have retained the prior names, endpoints, and namespaces.

For information, including how to migrate your WAF resources to this version, see the [WAF Developer Guide](#).

WAF is a web application firewall that lets you monitor the HTTP and HTTPS requests that are forwarded to Amazon CloudFront, an Amazon API Gateway REST API, an Application Load Balancer, an AppSync GraphQL API, or an Amazon Cognito user pool. WAF also lets you control access to your content. Based on conditions that you specify, such as the IP addresses that requests originate from or the values of query strings, the Amazon API Gateway REST API, CloudFront distribution, the Application Load Balancer, the AppSync GraphQL API, or the Amazon Cognito user pool responds to requests either with the requested content or with an HTTP 403 status code (Forbidden). You also can configure CloudFront to return a custom error page when a request is blocked.

This API guide is for developers who need detailed information about WAF API actions, data types, and errors. For detailed information about WAF features and an overview of how to use WAF, see the [WAF Developer Guide](#).

You can make calls using the endpoints listed in [WAF endpoints and quotas](#).

- For regional applications, you can use any of the endpoints in the list. A regional application can be an Application Load Balancer (ALB), an Amazon API Gateway REST API, an AppSync GraphQL API, or an Amazon Cognito user pool.
- For Amazon CloudFront applications, you must use the API endpoint listed for US East (N. Virginia): us-east-1.

Alternatively, you can use one of the Amazon Web Services SDKs to access an API that's tailored to the programming language or platform that you're using. For more information, see [Amazon Web Services SDKs](#).

We currently provide two versions of the WAF API: this API and the prior versions, the classic WAF APIs. This new API provides the same functionality as the older versions, with the following major improvements:

- You use one API for both global and regional applications. Where you need to distinguish the scope, you specify a `Scope` parameter and set it to `CLOUDFRONT` or `REGIONAL`.
- You can define a web ACL or rule group with a single call, and update it with a single call. You define all rule specifications in JSON format, and pass them to your rule group or web ACL calls.
- The limits WAF places on the use of rules more closely reflects the cost of running each type of rule. Rule groups include capacity settings, so you know the maximum cost of a rule group when you use it.

Usage

```
wafv2(config = list())
```

Arguments

<code>config</code>	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • access_key_id: AWS access key ID • secret_access_key: AWS secret access key • session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e., <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
---------------------	---

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the `Operations` section.

Service syntax

```
svc <- wafv2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
```

```

        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
),
endpoint = "string",
region = "string",
close_connection = "logical",
timeout = "numeric",
s3_force_path_style = "logical"
)
)

```

Operations

associate_web_acl	Associates a web ACL with a regional application resource, to protect the resource.
check_capacity	Returns the web ACL capacity unit (WCU) requirements for a specified scope.
create_ip_set	Creates an IPSet, which you use to identify web requests that originate from a specific IP address or range of IP addresses.
create_regex_pattern_set	Creates a RegexPatternSet, which you reference in a RegexPatternSetReference object.
create_rule_group	Creates a RuleGroup per the specifications provided.
create_web_acl	Creates a WebACL per the specifications provided.
delete_firewall_manager_rule_groups	Deletes all rule groups that are managed by Firewall Manager for the specified resource.
delete_ip_set	Deletes the specified IPSet.
delete_logging_configuration	Deletes the LoggingConfiguration from the specified web ACL.
delete_permission_policy	Permanently deletes an IAM policy from the specified rule group.
delete_regex_pattern_set	Deletes the specified RegexPatternSet.
delete_rule_group	Deletes the specified RuleGroup.
delete_web_acl	Deletes the specified WebACL.
describe_managed_rule_group	Provides high-level information for a managed rule group, including description, creation time, and status.
disassociate_web_acl	Disassociates the specified regional application resource from any existing web ACLs.
generate_mobile_sdk_release_url	Generates a presigned download URL for the specified release of the mobile SDK.
get_ip_set	Retrieves the specified IPSet.
get_logging_configuration	Returns the LoggingConfiguration for the specified web ACL.
get_managed_rule_set	Retrieves the specified managed rule set.
get_mobile_sdk_release	Retrieves information for the specified mobile SDK release, including release ID, version, and status.
get_permission_policy	Returns the IAM policy that is attached to the specified rule group.
get_rate_based_statement_managed_keys	Retrieves the keys that are currently blocked by a rate-based rule instance.
get_regex_pattern_set	Retrieves the specified RegexPatternSet.
get_rule_group	Retrieves the specified RuleGroup.
get_sampled_requests	Gets detailed information about a specified number of requests—a sample—through the specified web ACL.
get_web_acl	Retrieves the specified WebACL.
get_web_acl_for_resource	Retrieves the WebACL for the specified resource.
list_available_managed_rule_groups	Retrieves an array of managed rule groups that are available for you to use.
list_available_managed_rule_group_versions	Returns a list of the available versions for the specified managed rule group.
list_ip_sets	Retrieves an array of IPSetSummary objects for the IP sets that you manage.
list_logging_configurations	Retrieves an array of your LoggingConfiguration objects.
list_managed_rule_sets	Retrieves the managed rule sets that you own.

list_mobile_sdk_releases	Retrieves a list of the available releases for the mobile SDK and the specified region
list_regex_pattern_sets	Retrieves an array of RegexPatternSetSummary objects for the regex pattern sets that you have created
list_resources_for_web_acl	Retrieves an array of the Amazon Resource Names (ARNs) for the regional resources that are associated with the specified web ACL
list_rule_groups	Retrieves an array of RuleGroupSummary objects for the rule groups that you have created
list_tags_for_resource	Retrieves the TagInfoForResource for the specified resource
list_web_acl_ls	Retrieves an array of WebACLSummary objects for the web ACLs that you have created
put_logging_configuration	Enables the specified LoggingConfiguration, to start logging from a web ACL
put_managed_rule_set_versions	Defines the versions of your managed rule set that you are offering to the customer
put_permission_policy	Attaches an IAM policy to the specified resource
tag_resource	Associates tags with the specified Amazon Web Services resource
untag_resource	Disassociates tags from an Amazon Web Services resource
update_ip_set	Updates the specified IPSet
update_managed_rule_set_version_expiry_date	Updates the expiration information for your managed rule set
update_regex_pattern_set	Updates the specified RegexPatternSet
update_rule_group	Updates the specified RuleGroup
update_web_acl	Updates the specified WebACL

Examples

```
## Not run:
svc <- wafv2()
svc$associate_web_acl(
  Foo = 123
)

## End(Not run)
```
