Package ‘quickPlot’

July 2, 2023

Type Package

Title A System of Plotting Optimized for Speed and Modularity

Description A high-level plotting system, compatible with 'ggplot2' objects, maps from 'sf', 'terra', 'raster', 'sp'. It is built primarily on the 'grid' package. The objective of the package is to provide a plotting system that is built for speed and modularity. This is useful for quick visualizations when testing code and for plotting multiple figures to the same device from independent sources that may be independent of one another (i.e., different function or modules the create the visualizations). The suggested package 'fastshp' can be installed from the repository (<https://PredictiveEcology.r-universe.dev/>).

URL https://quickplot.predictiveecology.org,
     https://github.com/PredictiveEcology/quickPlot

Version 1.0.2

Date 2023-07-01

Depends R (>= 4.1)

Imports data.table (>= 1.10.4), fpCompare, grDevices, grid, methods, stats, terra, utils

Suggests covr, fastshp, ggplot2, knitr, raster, RColorBrewer, rmarkdown, sf, sp, testthat (>= 1.0.2), withr

Additional_repositories https://predictiveecology.r-universe.dev/

Encoding UTF-8

Language en-CA

License GPL-3

VignetteBuilder knitr, rmarkdown

**quickPlot-package**  
*The quickPlot package*

**Description**

A high-level plotting system, built using 'grid' graphics, that is optimized for speed and modularity. This has great utility for quick visualizations when testing code, with the key benefit that visualizations are updated independently of one another.

**Note**

The suggested package fastshp can be installed with `install.packages("fastshp", repos = "https://rforge.net", type = "source")`.

**.hasBbox**  
*Test whether class has bbox method*

**Description**

For internal use only.

**Usage**

```
.hasBbox(z, objClass, objName, objEnv)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z</td>
<td>Logical, whether this object is a SpatialObject</td>
</tr>
<tr>
<td>objClass</td>
<td>The class of the object</td>
</tr>
<tr>
<td>objName</td>
<td>The character string name of the object</td>
</tr>
<tr>
<td>objEnv</td>
<td>The environment where the object can be found</td>
</tr>
</tbody>
</table>

Description

This is a generic definition that can be extended according to class. Intended only for development use.

Usage

```
parseElems(tmp, elems, envir)
```

## S4 method for signature 'ANY'
(parseElems(tmp, elems, envir)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tmp</td>
<td>A evaluated object</td>
</tr>
<tr>
<td>elems</td>
<td>A character string to be parsed</td>
</tr>
<tr>
<td>envir</td>
<td>An environment</td>
</tr>
</tbody>
</table>

Value

An object, parsed from a character string and and environment

Author(s)

Eliot McIntire
clearPlot

Clear plotting device

Description
Under some conditions, a device and its metadata need to be cleared manually. This can be done with either the new = TRUE argument within the call to Plot. Sometimes, the metadata of a previous plot will prevent correct plotting of a new Plot call. Use clearPlot to clear the device and all the associated metadata manually.

Usage
clearPlot(
  dev = dev.cur(),
  removeData = TRUE,
  force = FALSE,
  verbose = getOption("quickPlot.verbose")
)

## S4 method for signature 'numeric,logical'
clearPlot(
  dev = dev.cur(),
  removeData = TRUE,
  force = FALSE,
  verbose = getOption("quickPlot.verbose")
)

## S4 method for signature 'numeric,missing'
clearPlot(dev, force)

## S4 method for signature 'missing,logical'
clearPlot(removedata, force)

## S4 method for signature 'missing,missing'
clearPlot(dev, removedata, force)

Arguments
dev Numeric. Device number to clear.
removeData Logical indicating whether any data that was stored in the .quickPlotEnv should also be removed; i.e., not just the plot window wiped.
force Logical or "all". Sometimes the graphics state cannot be fixed by a simple clearPlot(). If TRUE, this will close the device and reopen the same device number. If "all", then all quickPlot related data from all devices will be cleared, in addition to device closing and reopening.
verbose Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0, most messages will be suppressed.
coordinates

Extract coordinates from a variety of spatial objects

Description

This will extract using terra::crds, sf::st_coordinates and raster::coordinates. Other packages can create methods, as this is generic.

Usage

## S4 method for signature 'ANY'
coordinates(obj, ...)

Arguments

obj An object from which to extract the coordinates (e.g., sf, sp)
...

Ignored.

Value

A 2 column matrix of coordinates (x and y)

Examples

library(terra)
caribou <- terra::vect(x = cbind(x = stats::runif(1e1, -50, 50), y = stats::runif(1e1, -50, 50)))coordinates(caribou)
Description
Switch to an existing plot device, or if not already open, launch a new graphics device based on operating system used. On Windows and macOS, if \( x \) is not provided, this will open or switch to the first non-RStudio device, which is much faster than the ‘png’-based RStudio plot device. Currently, this will not open anything new.

Usage
\[
dev(x, ..., verbose = getOption("quickPlot.verbose"))
\]

Arguments
- \( x \) The number of a plot device. If missing, will open a new non-RStudio plotting device
- \( ... \) Additional arguments passed to \texttt{newPlot()}.
- \( \text{verbose} \) Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0, most messages will be suppressed.

Details
For example, \( \text{dev}(6) \) switches the active plot device to device 6. If it does not exist, it opens it. If devices 1-5 don’t exist they will be opened too.

Value
Opens a new plot device on the screen. Invisibly returns the device number selected.

Author(s)
Eliot McIntire and Alex Chubaty

Examples
```r
## Not run:
dev(4)

## End(Not run)
```
**divergentColors**  

**Divergent colour palette**

**Description**

Creates a palette for the current session for a divergent-colour graphic with a non-symmetric range. Based on ideas from Maureen Kennedy, Nick Povak, and Alina Cansler.

**Usage**

```r
divergentColors(
  start.color,
  end.color,
  min.value,
  max.value,
  mid.value = 0,
  mid.color = "white"
)
```

```r
## S4 method for signature 'character,character,numeric,numeric'
divergentColors(
  start.color,
  end.color,
  min.value,
  max.value,
  mid.value = 0,
  mid.color = "white"
)
```

**Arguments**

- `start.color`  
  Start colour to be passed to `colorRampPalette`.

- `end.color`  
  End colour to be passed to `colorRampPalette`.

- `min.value`  
  Numeric minimum value corresponding to `start.colour`. If attempting to change the colour of a `RasterLayer`, this can be set to `minFn(RasterObject)`.

- `max.value`  
  Numeric maximum value corresponding to `end.colour`. If attempting to change the colour of a `RasterLayer`, this can be set to `maxFn(RasterObject)`.

- `mid.value`  
  Numeric middle value corresponding to `mid.colour`. Default is 0.

- `mid.color`  
  Middle colour to be passed to `colorRampPalette`. Defaults to "white".

**Value**

A diverging colour palette.

**Author(s)**

Eliot McIntire and Alex Chubaty
**equalExtent**

See Also

- `colorRampPalette()`

Examples

```r
divergentColors("darkred", "darkblue", -10, 10, 0, "white")
```

---

**equalExtent**

Assess whether a list of extents are all equal

Description

Assess whether a list of extents are all equal

Usage

```r
equalExtent(extents)
```

## S4 method for signature 'list'

equalExtent(extents)

Arguments

- `extents` list of extents objects

Author(s)

Eliot McIntire

Examples

```r
library(terra)
files <- system.file("maps", package = "quickPlot")
files <- dir(files, full.names = TRUE, pattern = "tif")
maps <- lapply(files, function(x) terra::rast(x))
names(maps) <- sapply(basename(files), function(x) {
  strsplit(x, split = "\."))[1][1]
})
extnts <- lapply(maps, terra::ext)
equalExtent(extnts) # TRUE
```
getColors

Get extent of a variety of spatial objects

Description

This is a wrapper around `terra::ext`, `sf::st_bbox`, and `raster::extent`.

Usage

```r
## S4 method for signature 'ANY'
extent(x, ...)
```

Arguments

- `x`: The spatial object from which to extract the extent.
- `...`: Not used.

Value

Returns a list of length 4 with elements `xmin`, `xmax`, `ymin`, and `ymax`, in that order.

getColors

Get and set colours for plotting Raster* objects

Description

Get and set colours for plotting Raster* objects

setColors works as a replacement method or a normal function call. This function can accept `RColorBrewer` colours by name. See examples.

Usage

```r
getColors(object)

setColors(object, ..., n, verbose = getOption("quickPlot.verbose")) <- value
setColors(object, value, n, verbose = getOption("quickPlot.verbose"))
```
getColors

Arguments

- **object**: A Raster* object.
- **...**: Additional arguments to `colorRampPalette`.
- **n**: An optional vector of values specifying the number of levels from which to interpolate the colour palette.
- **verbose**: Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0, most messages will be suppressed.
- **value**: Named list of hex colour codes (e.g., from `RCOLORBrewer::brewer.pal`), corresponding to the names of `RasterLayers` in `x`.

Value

- Returns a named list of colours.
- Returns a Raster with the `colortable` slot set to values.

Author(s)

Alex Chubaty

See Also

- `setColors<-()`, `brewer.pal()`, `RCOLORBrewer::ColorBrewer`
- `brewer.pal()`, `RCOLORBrewer::ColorBrewer`, `colorRampPalette()`.

Examples

```r
library(terra)

ras <- rast(matrix(c(0, 0, 1, 2), ncol = 2, nrow = 2))

getColors(ras) ## none

# Use replacement method
setColors(ras, n = 3) <- c("red", "blue", "green")
getColors(ras)

clearPlot()
Plot(ras)

# Use function method
ras <- setColors(ras, n = 3, c("red", "blue", "yellow"))
getColors(ras)

clearPlot()
Plot(ras)

# Using the wrong number of colors, e.g., here 2 provided,
# for a raster with 3 values... causes interpolation, which may be surprising
ras <- setColors(ras, c("red", "blue"))
```
clearPlot()
Plot(ras)

# Real number rasters - interpolation is used
ras <- rast(matrix(runif(9), ncol = 3, nrow = 3)) |>
  setColors(c("red", "yellow")) # interpolates when real numbers, gives warning

clearPlot()
Plot(ras)

# Factor rasters, can be contiguous (numerically) or not, in this case not:
ras <- rast(matrix(sample(c(1, 3, 6), size = 9, replace = TRUE), ncol = 3, nrow = 3))
levels(ras) <- data.frame(ID = c(1, 3, 6), Names = c("red", "purple", "yellow"))
ras <- setColors(ras, n = 3, c("red", "purple", "yellow"))
getColors(ras)

clearPlot()
Plot(ras)

# if a factor raster, and not enough labels are provided, then a warning
# will be given, and colors will be interpolated
# The level called purple is not purple, but interpolated between red and yellow
suppressWarnings({
  ras <- setColors(ras, c("red", "yellow"))
clearPlot()
Plot(ras)
})

# use RColorBrewer colors
setColors(ras) <- "Reds"
clearPlot()
Plot(ras)

---

gpar

*Importing some grid functions*

**Description**

Currently only the `gpar` function is imported. This is a convenience so that users can change `Plot` arguments without having to load the entire grid package.

**Usage**

gpar(...)  

**Arguments**

... Any number of named arguments.
isRstudioServer

Determine if current session is RStudio Server

Usage

isRstudioServer()

Examples

isRstudioServer() # returns FALSE or TRUE

layerNames

Extract the layer names of Spatial Objects

Description

There are already methods for Raster* objects. This adds methods for SpatialPoints*, SpatialLines*, and SpatialPolygons*, returning an empty character vector of length 1. This function was created to give consistent, meaningful results for all classes of objects plotted by Plot.

Usage

layerNames(object)

## S4 method for signature 'ANY'
layerNames(object)

Arguments

object  A Raster*, SpatialPoints*, SpatialLines*, or SpatialPolygons* object; or list of these.

Author(s)

Eliot McIntire
Examples

library(terra)

## RasterLayer objects
files <- system.file("maps", package = "quickPlot")
files <- dir(files, full.names = TRUE, pattern = "tif")
maps <- lapply(files, function(x) terra::rast(x))
names(maps) <- eapply(basename(files), function(x) {
            strsplit(x, split = "\."))[1][1]
})
layerNames(maps)

## SpatVector objects
caribou <- terra::vect(cbind(x = stats::runif(1e2, -50, 50),
                          y = stats::runif(1e2, -50, 50)))
layerNames(caribou)

makeLines

Make SpatialLines object from two SpatialPoints objects

Description
The primary conceived usage of this is to draw arrows following the trajectories of agents.

Usage
makeLines(from, to)

Arguments
from    Starting spatial coordinates (SpatialPointsDataFrame).
to      Ending spatial coordinates (SpatialPointsDataFrame).

Value
A SpatialLines object. When this object is used within a Plot call and the length argument is specified, then arrow heads will be drawn. See examples.

Author(s)
Eliot McIntire
Examples

```r
library(terra)
# Make 2 objects
caribou1 <- terra::vect(cbind(x = stats::runif(10, -50, 50),
y = stats::runif(10, -50, 50)))
caribou2 <- terra::vect(cbind(x = stats::runif(10, -50, 50),
y = stats::runif(10, -50, 50)))
caribouTraj <- makeLines(caribou1, caribou2)

if (interactive())
  Plot(caribouTraj, length = 0.1) # shows arrows

# or to a previous Plot
files <- dir(system.file("maps", package = "quickPlot"), full.names = TRUE, pattern = "tif")
maps <- lapply(files, terra::rast)
names(maps) <- lapply(maps, names)
caribouTraj <- makeLines(caribou1, caribou2)

if (interactive()) {
  clearPlot()
  Plot(maps$DEM)
  Plot(caribouTraj, addTo = "maps$DEM", length = 0.1)
}
```

---

### newPlot

*Open a new plotting window*

#### Description

Open a new plotting window

#### Usage

```r
newPlot(noRStudioGD = TRUE, ..., verbose = getOption("quickPlot.verbose"))
```

#### Arguments

- `noRStudioGD` Logical. Passed to `dev.new`. Default is `TRUE` to avoid using RStudio graphics device, which is slow.
- `...` Additional arguments.
- `verbose` Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0, most messages will be suppressed.
numLayers

useRSGD Logical indicating whether the default device should be the RStudio graphic device, or the platform default (quartz on macOS; windows on Windows; x11 on others, e.g., Linux).

Note

dev.new() is supposed to be the correct way to open a new window in a platform-generic way; however, does not work in RStudio (SpaDES#116). Use dev.useRSGD(FALSE) to avoid RStudio for the remainder of this session, and dev.useRSGD(TRUE) to use the RStudio graphics device. (This sets the default device via the device option.)

Author(s)

Eliot McIntire and Alex Chubaty

See Also
dev().

Examples

## Not run:
## set option to avoid using Rstudio graphics device
dev.useRSGD(FALSE)

## open new plotting window
newPlot()

## End(Not run)

numLayers Find the number of layers in an object

Description

A unified function for raster::nlayers, terra::nlyrs, or lists of these. Default function returns 1L for all other classes.

Usage

numLayers(x)

Arguments

x An object or list of objects.

Value

The number of layers in the object.
Author(s)

Eliot McIntire

Examples

```r
library(terra)
files <- system.file("maps", package = "quickPlot")
files <- dir(files, full.names = TRUE, pattern = "tif")
maps <- lapply(files, function(x) rast(x))
names(maps) <- sapply(basename(files), function(x) {
    strsplit(x, split = "\.["\][1]][1]
})
stck <- rast(maps)
numLayers(maps)
numLayers(stck)
```

Plot

Plot: Fast, optimally arranged, multi-panel plotting

Description

This can take objects of type Raster*, SpatialPoints*, SpatialPolygons*, and any combination of those. These can be provided as individual objects, or a named list. If a named list, the names either represent a different original object in the calling environment and that will be used, or if the names don’t exist in the calling environment, then they will be copied to .quickPlotEnv for reuse later. It can also handle ggplot2 objects or base::histogram objects created via call to exHist <- hist(1:10, plot = FALSE). It can also take arguments as if it were a call to plot. In this latter case, the user should be explicit about naming the plot area using addTo. Customization of the ggplot2 elements can be done as a normal ggplot2 plot, then added with Plot(ggplotObject).

Usage

```r
Plot(
    ..., 
    new = FALSE, 
    addTo = NULL, 
    gp = gpar(), 
    gpText = gpar(), 
    gpAxis = gpar(), 
    axes = FALSE, 
    speedup = 1, 
    size = 5, 
    cols = NULL, 
    col = NULL, 
    zoomExtent = NULL,
)```
visualSqueeze = NULL,
legend = TRUE,
legendRange = NULL,
legendText = NULL,
pch = 19,
title = NULL,
na.color = "#FFFFFF00",
zero.color = NULL,
length = NULL,
arr = NULL,
plotFn = "plot",
verbose = getOption("quickPlot.verbose")
)

## S4 method for signature 'ANY'
Plot(
    ...
)
Plot(
    ...,
    new = FALSE,
    addTo = NULL,
    gp = gpar(),
    gpText = gpar(),
    gpAxis = gpar(),
    axes = FALSE,
    speedup = 1,
    size = 5,
    cols = NULL,
    col = NULL,
    zoomExtent = NULL,
    visualSqueeze = NULL,
    legend = TRUE,
    legendRange = NULL,
    legendText = NULL,
pch = 19,
title = NULL,
na.color = "#FFFFFF00",
zero.color = NULL,
length = NULL,
arr = NULL,
plotFn = "plot",
verbose = getOption("quickPlot.verbose")
)

rePlot(
    toDev = dev.cur(),
    fromDev = dev.cur(),
clearFirst = TRUE,
    ...
)
verbose = getOption("quickPlot.verbose")
Arguments

... A combination of spatialObjects or non-spatial objects. For many object classes, there are specific Plot methods. Where there are no specific ones, the base plotting will be used internally. This means that for objects with no specific Plot methods, many arguments, such as addTo, will not work. See details.

new Logical. If TRUE, then the previous named plot area is wiped and a new one made; if FALSE, then the ... plots will be added to the current device, adding or rearranging the plot layout as necessary. Default is FALSE. This currently works best if there is only one object being plotted in a given Plot call. However, it is possible to pass a list of logicals to this, matching the length of the ... objects. Use clearPlot to clear the whole plotting device. NOTE if TRUE: Everything that was there, including the legend and the end points of the colour palette, will be removed and re-initiated.

addTo Character vector, with same length as .... This is for overplotting, when the overplot is not to occur on the plot with the same name, such as plotting a SpatialPoints* object on a RasterLayer.

gp A gpar object, created by gpar(), to change plotting parameters (see grid package).

gpText A gpar object for the title text. Default gpar(col = "black").

gpAxis A gpar object for the axes. Default gpar(col = "black").

axes Logical or "L", representing the left and bottom axes, over all plots.

speedup Numeric. The factor by which the number of pixels is divided by to plot rasters. See Details.

size Numeric. The size, in points, for SpatialPoints symbols, if using a scalable symbol.

cols (also col) Character vector or list of character vectors of colours. See details.

col (also cols) Alternative to cols to be consistent with plot. cols takes precedence, if both are provided.

zoomExtent An Extent object. Supplying a single extent that is smaller than the rasters will call a crop statement before plotting. Defaults to NULL. This occurs after any downsampling of rasters, so it may produce very pixelated maps.

visualSqueeze Numeric. The proportion of the white space to be used for plots. Default is 0.75.

legend Logical indicating whether a legend should be drawn. Default is TRUE.

legendRange Numeric vector giving values that, representing the lower and upper bounds of a legend (i.e., 1:10 or c(1, 10) will give same result) that will override the data bounds contained within the grobToPlot.

legendText Character vector of legend value labels. Defaults to NULL, which results in a pretty numeric representation. If Raster* has a Raster Attribute Table (rat; see raster package), this will be used by default. Currently, only a single vector is accepted. The length of this must match the length of the legend, so this is mostly useful for discrete-valued rasters.
pch

see \texttt{?par}.

title

Logical or character string. If logical, it indicates whether to print the object name as the title above the plot. If a character string, it will print this above the plot. \textbf{NOTE:} the object name is used with \texttt{addTo}, not the title. Default NULL, which means print the object name as title, if no other already exists on the plot, in which case, keep the previous title.

na.color

Character string indicating the colour for NA values. Default transparent.

zero.color

Character string indicating the colour for zero values, when zero is the minimum value, otherwise, zero is treated as any other colour. Default transparent.

length

Numeric. Optional length, in inches, of the arrow head.

arr

A vector of length 2 indicating a desired arrangement of plot areas indicating number of rows, number of columns. Default NULL, meaning let Plot function do it automatically.

plotFn

An optional function name to do the plotting internally, e.g., "barplot" to get a \texttt{barplot()} call. Default \texttt{"plot"}.

verbose

Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0, most messages will be suppressed.

toDev

Numeric. Which device should the new replot be plotted to. Default is current device.

fromDev

Numeric. Which device should the replot information be taken from. Default is current device.

clearFirst

Logical. Should \texttt{clearPlot()} be run before replotting. Default TRUE.

\section*{Details}

\textbf{NOTE:} \texttt{Plot} uses the \texttt{grid} package; therefore, it is NOT compatible with base R graphics. Also, because it does not by default wipe the plotting device before plotting, a call to \texttt{clearPlot()} is helpful to resolve many errors. Careful use of the other device tools, such as \texttt{dev.off()} and \texttt{dev.list()} might also clear problems that may arise.

If \texttt{new = TRUE}, a new plot will be generated, but only in the figure region that has the same name as the object being plotted. This is different than calling \texttt{clearPlot()}; \texttt{Plot(Object)}, i.e., directly before creating a new \texttt{Plot}. \texttt{clearPlot()} will clear the entire plotting device. When \texttt{new = FALSE}, any plot that already exists will be overplotted, while plots that have not already been plotted will be added. This function rearranges the plotting device to maximize the size of all the plots, minimizing white space. If using the RStudio IDE, it is recommended to make and use a new device with \texttt{dev()}, because the built in device is not made for rapid redrawing. The function is based on the \texttt{grid} package.

Each panel in the multipanel plot must have a name. This name is used to overplot, rearrange the plots, or overlay using \texttt{addTo} when necessary. If the ... are named \texttt{spatialObjects}, then \texttt{Plot} will use these names. However, this name will not persist when there is a future call to \texttt{Plot} that forces a rearrangement of the plots. A more stable way is to use the object names directly, and any layer names (in the case of \texttt{RasterLayer} or \texttt{RasterStack} objects). If plotting a \texttt{RasterLayer} and the layer name is "layer" or the same as the object name, then, for simplicity, only the object name will be used. In other words, only enough information is used to uniquely identify the plot.
For modularity, Plot must have access to the original objects that were plotted. These objects will be used if a subsequent Plot event forces a rearrangement of the plot device. Rather than saving all the plot information (including the data) at each Plot call (this is generally too much data to constantly make copies), the function saves a pointer to the original R object. If the plot needs to be rearranged because of a future addition, then Plot will search for that original object that created the first plots, and replot them. This has several consequences. First, that object must still exist and in the same environment. Second, if that object has changed between the first time it is plot and any subsequent time it is replotted (via a forced rearrangement), then it will take the object as it exists, not as it existed. Third, if passing a named list of objects, Plot will either create a link to objects with those names in the calling environment (e.g., .GlobalEnv) or, if they do not exist, then Plot will make a copy in the hidden .quickPlotEnv for later reuse.

cols is a vector of colours that can be understood directly, or by colorRampPalette(), such as c("orange", "blue"), will give a colour range from orange to blue, interpolated. If a list, it will be used, in order, for each item to be plotted. It will be recycled if it is shorter than the objects to be plotted. Note that when this approach to setting colours is used, any overplotting will revert to the colortable slot of the object, or the default for rasters, which is terrain.color()
cols can also accept RColorBrewer colours by keyword if it is character vector of length 1, i.e., this cannot be used to set many objects by keyword in the same Plot call. Default terrain.color(). See Details.

Some colouring will be automatic. If the object being plotted is a Raster, then this will take the colorTable slot (can be changed via setColors() or other ways). If this is a SpatialPointsDataFrame, this function will use a column called colors and apply these to the symbols.

For SpatialPolygons, cols can accept RColorBrewer colours by keyword as a character vector of length 1. For more control, pass a vector of colours to cols or to gp = gpar(fill = vectorOfColours).
In this second approach, the length of the vectorOfColours can be either less then or equal to the number of polygons in the SpatialPolygons object – each polygon within a Polygons object will share the same colour – or it can be greater than this number to give a different colour to each Polygon (of which there can be MANY more than Polygons. Plot will recycle these colours if there are not enough. The order provided will be the order assigned to each Polygons or Polygon object.

Silently, one hidden object is made, .quickPlot in the .quickPlotEnv environment, which is used for arranging plots in the device window, and identifying the objects to be replotted if rearranging is required, subsequent to a new = FALSE additional plot.

This function is optimized to allow modular Plotting. This means that several behaviours will appear unusual. For instance, if a first call to Plot is made, the legend will reflect the current colour scheme. If a second or subsequent call to Plot is made with the same object but with different colours (e.g., with cols), the legend will not update. This behaviour is made with the decision that the original layer takes precedence and all subsequent plots to that same frame are over-plots only.
speedup is not a precise number because it is faster to plot an non-resampled raster if the new resampling is close to the original number of pixels. At the moment, for rasters, this is set to 1/3 of the original pixels. In other words, speedup will not do anything if the factor for speeding up is not high enough (i.e., >3). If no sub-sampling is desired, use a speedup value less than 0.1.

These gp* parameters will specify plot parameters that are available with gpar(). gp will adjust plot parameters, gpText will adjust title and legend text, gpAxis will adjust the axes. size adjusts point size in a SpatialPoints object. These will persist with the original Plot call for each individual object. Multiple entries can be used, but they must be named list elements and they must
match the ... items to plot. This is true for a RasterStack also, i.e., the list of named elements must be the same length as the number of layers being plotted. The naming convention used is: RasterStackName$layerName, i.e, landscape$DEM.

### Value

Invisibly returns the .quickPlot class object. If this is assigned to an object, say obj, then this can be plotted again with Plot(obj). This object is also stored in the locked .quickPlotEnv, so can simply be replotted with rePlot() or on a new device with rePlot(n), where n is the new device number.

**quickPlotClasses**

**quickPlot classes**

**Description**

quickPlot uses S4 classes. "Dot" classes are not exported and are therefore intended for internal use only.

**Plotting classes - used within Plot**

**New classes**

- `.arrangement()` The layout or "arrangement" of plot objects
- `.quickPlot()` Main class for Plot - contains .quickGrob and .arrangement objects
- `.quickPlotGrob()` GRaphical OBject used by quickPlot - smallest unit

**Unions of existing classes:**

- `.quickPlottables` The union of all object classes Plot can accept
- `.quickPlotObjects` The union of spatialObjects and several others

Plot()

---

**sample-maps**

*Dummy maps included with quickPlot*

---

**Description**

All maps included here are randomly generated maps created using `SpaDES.tools::gaussMap()`. These are located within the `maps` folder of the package, and are used in the vignettes. Use `system.file("maps", package = "quickPlot")` to locate the `maps/` directory on your system.

**Format**

raster

**Details**

- DEM.tif: converted to a small number of discrete levels (in 100m hypothetical units).
- habitatQuality.tif: made to look like a continuous habitat surface, rescaled to 0 to 1.
- forestAge.tif: rescaled to possible forest ages in a boreal forest setting.
- forestCover.tif: rescaled to possible forest cover in a boreal forest setting.
- percentPine.tif: rescaled to percentages.

---

**sp2sl**

*Convert pairs of coordinates to SpatialLines*

---

**Description**

This will convert 2 objects whose coordinates can be extracted with `coordinates` (e.g., `sp::SpatialPoints*`) to a single `SpatialLines` object. The first object is treated as the "to" (destination), and the second object the "from" (source). This can be used to represent directional `SpatialLines`, especially with arrow heads, as in `Plot(sl, length = 0.1)`.

**Usage**

`sp2sl(sp1, from)`
Arguments

sp1 a SpatialPoints* object
from a SpatialPoints* object. Optional. If not provided, then the function will attempt to find the "previous" coordinates as columns (prevX, prevY) in the sp1 object.

Examples

caribou <- terra::vect(x = cbind(x = stats::runif(1e1, -50, 50),
                           y = stats::runif(1e1, -50, 50))
caribouFrom <- terra::vect(x = cbind(x = stats::runif(1e1, -50, 50),
                                   y = stats::runif(1e1, -50, 50))
caribouLines <- sp2sl(caribou, caribouFrom)
if (interactive()) {
  clearPlot()
  Plot(caribouLines, length = 0.1)
}

Description

For visualizing, it is sometimes useful to remove points in Spatial* objects. This will change the geometry, so it is not recommended for computation. This is similar to sf::st_simplify, but faster (see examples) for large shapefiles, particularly if returnDataFrame is TRUE. thin will not attempt to preserve topology. It is strictly for making smaller polygons for the (likely) purpose of visualizing more quickly.

Usage

thin(
  x, 
  tolerance, 
  returnDataFrame, 
  minCoordsToThin, 
  ..., 
  verbose = getOption("quickPlot.verbose")
)

thnSpatialPolygons(
  x, 
  tolerance = NULL, 
  returnDataFrame = FALSE, 
  minCoordsToThin = 1e+05, 
  maxNumPolygons = getOption("quickPlot.maxNumPolygons", 3000), 
  ..., 
)
whereInStack

verbose = getOption("quickPlot.verbose")
)

## Default S3 method:
thin(
  x,
  tolerance,
  returnDataFrame,
  minCoordsToThin,
  maxNumPolygons,
  ...
)
  verbose = getOption("quickPlot.verbose")
)

Arguments

x               A Spatial* object
tolerance       Maximum allowable distance for a point to be removed.
returnDataFrame If TRUE, this will return a list of 3 elements, xyOrd, hole, and idLength. If
                 FALSE (default), it will return a SpatialPolygons object.
minCoordsToThin If the number of coordinates is smaller than this number, then thin will just pass
                 through, though it will take the time required to calculate how many points there
                 are (which is not NROW(coordinates(x)) for a SpatialPolygon)
...
  Passed to methods (e.g., maxNumPolygons)
verbose         Numeric or logical. If TRUE or >0, then messages will be shown. If FALSE or 0,
                 most messages will be suppressed.
maxNumPolygons  For speed, thin can also simply remove some of the polygons. This is likely
                 only a reasonable thing to do if there are a lot of polygons being plotted in a small
                 space. Current default is taken from options('quickPlot.maxNumPolygons'),
                 with a message.

whereInStack  Find the environment in the call stack that contains an object by name

Description

This is similar to pryr::where, except instead of working up the search() path of packages, it
searches up the call stack for an object. Ostensibly similar to base::dynGet, but it will only return
the environment, not the object itself and it will try to extract just the object name from name, even
if supplied with a more complicated name (e.g., if obj$firstElement@slot1$size is supplied,
the function will only search for obj). The function is fairly fast. This function is an important
component to the Plot function.
Usage

\texttt{whereInStack(name, whFrame = -1)}

Arguments

\begin{itemize}
  \item \texttt{name} \hspace{1cm} An object name to find in the call stack
  \item \texttt{whFrame} \hspace{1cm} A numeric indicating which \texttt{sys.frame} (by negative number) to start searching in.
\end{itemize}

Details

The difference between this and what \texttt{get} and \texttt{exists} do, is that these other functions search up the enclosing environments, i.e., it matters where the functions were defined. \texttt{whereInStack} looks up the call stack environments. See the example for the difference.

Value

The environment that is in the call stack where the object exists, that is closest to the frame in which this function is called.

Examples

\begin{verbatim}
b <- 1
inner <- function(y) {
objEnv <- whereInStack("b")
  get("b", envir = objEnv)
}
findB <- function(x) {
b <- 2
  inner()
}
findB() # Finds 2 because it is looking up the call stack, i.e., the user's perspective # defined outside of \texttt{findB2}, so its enclosing environment is the same as \texttt{findB2}
innerGet <- function(y) {
  get("b")
}
findB2 <- function(x) {
b <- 2
  innerGet()
}
findB2() # Finds 1 because \texttt{b} has a value of 1 in the enclosing environment of \texttt{innerGet}
b <- 3
findB2() # Finds 3 because \texttt{b} has a value of 3 in the enclosing environment of \texttt{innerGet}, # i.e., the environment in which \texttt{innerGet} was defined
findB() # Still finds 2 because the call stack hasn't changed
# compare base::\texttt{dynGet}
findB3 <- function(x) {
b <- 2
  dynGet("b")
}\end{verbatim}
findB3() # same as findB(), but marginally faster, because it omits the stripping on
    # sub elements that may be part of the name argument

b <- list()
findB3 <- function() {
  b$a <- 2
  dynGet("b$a")
}
testthat::expect_error(findB3()) # fails because not an object name

findB <- function() {
  b$a <- 2
  env <- whereInStack("b$a")
  env
}
findB() # finds it
