Package ‘raws.profile’

January 4, 2019

Type    Package
Title   Managing Profiles on Amazon Web Service
Version 0.1.0
Maintainer Samuel Macedo <samuelmacedo@recife.ifpe.edu.br>
Description This is an R wrapper from the AWS Command Line Interface that provides methods to manage the user configuration on Amazon Web Service. You can create as many profiles as you want, manage them, and delete them. The profiles created with this tool work with all AWS products such as S3, Glacier, and EC2. It also provides a function to automatically install AWS CLI, but you can download it and install it manually if you prefer.
License GPL (>= 2)

Index 6
aws_cli_install  
*Install AWS CLI*

**Description**

This function download and install the AWS CLI for windows, linux or mac. For Linux and Mac is necessary Python 2.6.5 or greater. You can also install the CLI manually, see [https://aws.amazon.com/cli/](https://aws.amazon.com/cli/)

**Usage**

```python
aws_cli_install()
```

aws_profile  
*User profile configuration*

**Description**

Functions to configure and visualize the user credentials. You can see a profile settings using `profile_settings()` and visualize all profiles created using `list_profiles()`. The AWS CLI saves your credentials in `~/.aws` folder, so, for security reasons, delete your credentials when you finish your work using `delete_all_profiles()`.

**Usage**

```python
create_profile(profile = "default", access_key = nullL access_key = null, region = null)
profile_settings(profile = "default")
```

**Arguments**

- **profile**  
The profile-name. If profile was not supplied `create_profile()` will create a default profile.
- **access_key**  
The access key create by AWS.
- **secret_key**  
The secret key create by AWS.
- **region**  
The default region
**aws_version**

**Examples**

```bash
## Not run:
# To run these examples you need the AWS CLI, use
# aws_cli_install() if it is not installed.

# create a default user
create_profile(access_key = "my_access_key_1",
               secret_key = "123456789",
               region = "us-east-1")

# verify if the user was created
profile_settings()

# you can also create a user with a profile name
create_profile(profile = "my_access_key_2",
               access_key = "my_access_key_2",
               secret_key = "987654321",
               region = "us-west-1")

# verify if the user was created
profile_settings(profile = "my_access_key_2")

# remove your credentials from this computer
delete_all_profiles()

## End (Not run)
```

<table>
<thead>
<tr>
<th>aws_version</th>
<th>AWS CLI version</th>
</tr>
</thead>
</table>

**Description**

This function provides the version of AWS CLI installed. A message to use `aws_cli_install()` will be exhibit if the AWS CLI was not found.

**Usage**

```bash
aws_version()
```

<table>
<thead>
<tr>
<th>delete_profile</th>
<th>Delete profiles</th>
</tr>
</thead>
</table>

**Description**

These functions delete the profiles created. Use `delete_profile()` to delete one or more profiles and use `delete_all_profiles()` if you want to delete all of them.
Usage

delete_profile(profile = "default")

delete_all_profiles()

Arguments

profile A string or a vector of strings with the profiles to delete.

Examples

## Not run:
# To run these examples you need the AWS CLI, use
# aws_cli_install() if it is not installed.

# default user
create_profile(access_key = "my_access_key_1",
secret_key = "123456789",
region = "us-east-1")

# profile_name1
create_profile(profile = "profile_name1",
access_key = "my_access_key_2",
secret_key = "987654321",
region = "us-west-1")

# profile_name2
create_profile(profile = "profile_name2",
access_key = "my_access_key_3",
secret_key = "12344321",
region = "us-west-1")

# profile_name3
create_profile(profile = "profile_name3",
access_key = "my_access_key_3",
secret_key = "98766789",
region = "us-east-1")

# profile_name4
create_profile(profile = "profile_name4",
access_key = "my_access_key_4",
secret_key = "192837465",
region = "us-west-1")

# profile_name5
create_profile(profile = "profile_name5",
access_key = "my_access_key_5",
secret_key = "546372819",
region = "us-east-1")

# delete default profile
delete_profile()
list_profiles  

# delete one profile  
delete_profile("profile_name1")  

# delete two profiles  
delete_profile(c("profile_name2", "profile_name3"))  

# remove your credentials from this computer  
delete_all_profiles()  

## End(Not run)

---

| list_profiles | The profile names saved |

### Description

The AWs CLI creates two profile files: credentials and config. This function return the profiles availables in both files.

### Usage

list_profiles()

### Value

A tibble with the profile names available.

### Examples

```r  
## Not run:  
# use this for profile names available  
list_profiles()  

## End(Not run)
