Package ‘scorecard’

August 5, 2021

Version 0.3.4

Title Credit Risk Scorecard

Description The ‘scorecard’ package makes the development of credit risk scorecard
easier and efficient by providing functions for some common tasks,
such as data partition, variable selection, woe binning, scorecard scaling,
performance evaluation and report generation. These functions can also used
in the development of machine learning models.

**Description**

This function provides descriptive statistic for exploratory data analysis.

**Usage**

`describe(dt)`

**Arguments**

- `dt`  
  A data frame.

**Examples**

```r
library(data.table)

data("germancredit")
dat = rbind(
  setDT(germancredit),
  data.table(credibility=sample(c("good","bad"),100,replace=TRUE)),
```
Description

gains_table creates a data frame including distribution of total, negative, positive, positive rate and approval rate by score bins. It provides both equal width and equal frequency intervals on score binning.

Usage

gains_table(score, label, bin_num = 10, method = "freq", width_by = NULL, breaks_by = NULL, positive = "bad1", ...)

Arguments

score A list of credit score for actual and expected data samples. For example, score = list(actual = scoreA, expect = scoreE).

label A list of label value for actual and expected data samples. For example, label = list(actual = labelA, expect = labelE).

bin_num Integer, the number of score bins. Defaults to 10. If it is 'max', then individual scores are used as bins.

method The score is binning by equal frequency or equal width. Accepted values are 'freq' and 'width'. Defaults to 'freq'.

width_by Number, increment of the score breaks when method is set as 'width'. If it is provided the above parameter bin_num will not be used. Defaults to NULL.

breaks_by The name of data set to create breakpoints. Defaults to the first data set. Or numeric values to set breakpoints manually.

positive Value of positive class, Defaults to "bad1".

Value

A data frame

---

**German Credit Data**

**Description**
Credit data that classifies debtors described by a set of attributes as good or bad credit risks. See source link below for detailed information.

**Usage**
data(germancredit)

**Format**
A data frame with 21 variables (numeric and factors) and 1000 observations.

**Source**
http://archive.ics.uci.edu/ml/datasets/Statlog+(German+Credit+Data)

**Examples**

# load German credit data
data(germancredit)

# structure of germancredit
str(germancredit)

# summary of germancredit
# lapply(germancredit, summary)

iv  Information Value

Description

This function calculates information value (IV) for multiple x variables. It treats each unique value in x variables as a group. If there is a zero number of y class, it will be replaced by 0.99 to make sure woe/iv is calculable.

Usage

iv(dt, y, x = NULL, positive = "bad|1", order = TRUE)

Arguments

dt  A data frame with both x (predictor/feature) and y (response/label) variables.
y  Name of y variable.
x  Name of x variables. Defaults to NULL. If x is NULL, then all columns except y are counted as x variables.
positive  Value of positive class, Defaults to "bad|1".
order  Logical, Defaults to TRUE. If it is TRUE, the output will descending order via iv.

Details

IV is a very useful concept for variable selection while developing credit scorecards. The formula for information value is shown below:

\[ IV = \sum (\text{DistributionPositive}_i - \text{DistributionNegative}_i) \times \ln\left(\frac{\text{DistributionPositive}_i}{\text{DistributionNegative}_i}\right). \]

The log component in information value is defined as weight of evidence (WOE), which is shown as

\[ \text{Weight of Evidence} = \ln\left(\frac{\text{DistributionPositive}_i}{\text{DistributionNegative}_i}\right). \]

The relationship between information value and predictive power is as follows:

<table>
<thead>
<tr>
<th>Information Value</th>
<th>Predictive Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 0.02</td>
<td>useless for prediction</td>
</tr>
<tr>
<td>0.02 to 0.1</td>
<td>Weak predictor</td>
</tr>
<tr>
<td>0.1 to 0.3</td>
<td>Medium predictor</td>
</tr>
<tr>
<td>&gt; 0.3</td>
<td>Strong predictor</td>
</tr>
</tbody>
</table>
### one_hot

**Value**

A data frame with columns for variable and info_value

**Examples**

```r
# Load German credit data
data(germancredit)

# information values
info_value = iv(germancredit, y = "creditability")

str(info_value)
```

---

### Description

One-hot encoding on categorical variables and replace missing values. It is not needed when creating a standard scorecard model, but required in models that without doing woe transformation.

**Usage**

```r
one_hot(dt, var_skip = NULL, var_encode = NULL, nacol_rm = FALSE, ...)
```

**Arguments**

- `dt`: A data frame.
- `var_skip`: Name of categorical variables that will skip for one-hot encoding. Defaults to NULL.
- `var_encode`: Name of categorical variables to be one-hot encoded. Defaults to NULL. If it is NULL, then all categorical variables except in var_skip are counted.
- `nacol_rm`: Logical. One-hot encoding on categorical variable contains missing values, whether to remove the column generated to indicate the presence of NAs. Defaults to FALSE.
- `...`: Additional parameters.

**Value**

A data frame
Examples

```r
# load germancredit data
data(germancredit)
library(data.table)
dat = rbind(
  setDT(germancredit)[, c(sample(20,3),21)],
  data.table(creditability=sample(c("good","bad"),10,replace=TRUE)),
  fill=TRUE)

# one hot encoding
## keep na columns from categorical variable
dat_onehot1 = one_hot(dat, var_skip = 'creditability', nacol_rm = FALSE) # default
str(dat_onehot1)
## remove na columns from categorical variable
dat_onehot2 = one_hot(dat, var_skip = 'creditability', nacol_rm = TRUE)
str(dat_onehot2)
```

---

**perf_cv**

**Cross Validation**

Description

`perf_cv` provides cross validation on logistic regression and other binomial classification models.

Usage

```r
perf_cv(dt, y, x = NULL, no_folds = 5, seeds = NULL,
  binomial_metric = "ks", positive = "bad|1", breaks_list = NULL, ...)
```

Arguments

- **dt**: A data frame with both x (predictor/feature) and y (response/label) variables.
- **y**: Name of y variable.
- **x**: Name of x variables. Defaults to NULL. If x is NULL, then all columns except y are counted as x variables.
- **no_folds**: Number of folds for K-fold cross-validation. Defaults to 5.
- **seeds**: The seeds to create multiple random splits of the input dataset into training and validation data by using `split_df` function. Defaults to NULL.
- **binomial_metric**: Defaults to ks.
- **positive**: Value of positive class, defaults to "bad|1".
- **breaks_list**: List of break points, defaults to NULL. If it is NULL, then using original values of the input data to fitting model, otherwise converting into woe values based on training data.
- **...**: Additional parameters.
Value

A list of data frames of binomial metrics for each datasets.

Examples

## Not run:
data("germancredit")

dt = var_filter(germancredit, y = 'creditability')
bins = woebin(dt, y = 'creditability')
dt_woe = woebin_ply(dt, bins)

perf1 = perf_cv(dt_woe, y = 'creditability', no_folds = 5)

perf2 = perf_cv(dt_woe, y = 'creditability', no_folds = 5,
                seeds = sample(1000, 10))

perf3 = perf_cv(dt_woe, y = 'creditability', no_folds = 5,
                binomial_metric = c('ks', 'auc'))

## End(Not run)

perf_eva  Binomial Metrics

Description

perf_eva calculates metrics to evaluate the performance of binomial classification model. It can also creates confusion matrix and model performance graphics.

Usage

perf_eva(pred, label, title = NULL, binomial_metric = c("mse", "rmse",
"logloss", "r2", "ks", "auc", "gini"), confusion_matrix = FALSE,
threshold = NULL, show_plot = c("ks", "lift"), pred_desc = TRUE,
positive = "bad|1", ...)

Arguments

pred  A list or vector of predicted probability or score.
label A list or vector of label values.
title The title of plot. Defaults to NULL.
binomial_metric  Defaults to c('mse', 'rmse', 'logloss', 'r2', 'ks', 'auc', 'gini'). If it is NULL, then no metric will calculated.
confusion_matrix
Logical, whether to create a confusion matrix. Defaults to TRUE.

threshold
Confusion matrix threshold. Defaults to the pred on maximum F1.

show_plot
Defaults to c('ks', 'roc'). Accepted values including c('ks', 'lift', 'gain', 'roc', 'lz', 'pr', 'f1', 'density').

pred_desc
whether to sort the argument of pred in descending order. Defaults to TRUE.

positive
Value of positive class. Defaults to "bad|1".

... Additional parameters.

Details
Accuracy = true positive and true negative/total cases
Error rate = false positive and false negative/total cases
TPR, True Positive Rate(Recall or Sensitivity) = true positive/total actual positive
PPV, Positive Predicted Value(Precision) = true positive/total predicted positive
TNR, True Negative Rate(Specificity) = true negative/total actual negative = 1-FPR
NPV, Negative Predicted Value = true negative/total predicted negative

Value
A list of binomial metric, confusion matrix and graphics

# Example I # only total psi
psi1 = perf_psi(score = score_list, label = label_list)
psi1$psi # psi data frame
psi1$pic # pic of score distribution

# Example II # both total and variable psi
psi2 = perf_psi(score = score_list2, label = label_list)
# psi2$psi # psi data frame
# psi2$pic # pic of score distribution

##### gains_table examples #####
# Example I, input score and label can be a list or a vector
g1 = gains_table(score = score_list$train, label = label_list$train)
g2 = gains_table(score = score_list, label = label_list)

# Example II, specify the bins number and type
g3 = gains_table(score = score_list, label = label_list, bin_num = 20)
g4 = gains_table(score = score_list, label = label_list, method = 'width')
Description

perf_psi calculates population stability index (PSI) for total credit score and Characteristic Stability Index (CSI) for variables. It can also creates graphics to display score distribution and positive rate trends.

Usage

perf_psi(score, label = NULL, title = NULL, show_plot = TRUE, positive = "bad|1", threshold_variable = 20, var_skip = NULL, ...)

Arguments

score       A list of credit score for actual and expected data samples. For example, score = list(expect = scoreE, actual = scoreA).
label       A list of label value for actual and expected data samples. For example, label = list(expect = labelE, actual = labelA). Defaults to NULL.
title       Title of plot, Defaults to NULL.
show_plot   Logical. Defaults to TRUE.
positive    Value of positive class, Defaults to "bad|1".
threshold_variable  Integer. Defaults to 20. If the number of unique values > threshold_variable, the provided score will be counted as total credit score, otherwise, it is variable score.
var_skip    Name of variables that are not score, such as id column. It should be the same with the var_kp in scorecard_ply function. Defaults to NULL.
...          Additional parameters.

Details

The population stability index (PSI) formula is displayed below:

\[
PSI = \sum ((Actual\% - Expected\%) \times \ln \left( \frac{Actual\%}{Expected\%} \right)).
\]

The rule of thumb for the PSI is as follows: Less than 0.1 inference insignificant change, no action required; 0.1 - 0.25 inference some minor change, check other scorecard monitoring metrics; Greater than 0.25 inference major shift in population, need to delve deeper.

Characteristic Stability Index (CSI) formula is displayed below:

\[
CSI = \sum ((Actual\% - Expected\%) \times score).
\]
Value

A data frame of psi and graphics of credit score distribution

---

**replace_na**

**Replace Missing Values**

### Description

Replace missing values with a specified value or mean/median value.

### Usage

```r
replace_na(dt, repl)
```

### Arguments

- **dt**: A data frame or vector.
- **repl**: Replace missing values with a specified value such as -1, or the mean/median value for numeric variable and mode value for categorical variable if repl is mean or median.
Examples

# load germancredit data
data(germancredit)

library(data.table)
dat = rbind(
  setDT(germancredit)[, c(sample(20,3),21)],
  data.table(creditability=sample(c("good","bad"),10,replace=TRUE)),
  fill=TRUE)

## replace with -1
dat_repna1 = replace_na(dat, repl = -1)
## replace with median for numeric, and mode for categorical
dat_repna2 = replace_na(dat, repl = "median")
## replace with mean for numeric, and mode for categorical
dat_repna3 = replace_na(dat, repl = "mean")

Description

report creates a scorecard modeling report and save it as a xlsx file.

Usage

report(dt, y, x, breaks_list, special_values = NULL, seed = 618,
       save_report = "report", positive = "bad|1", ...)

Arguments

dt A data frame or a list of data frames that have both x (predictor/feature) and y (response/label) variables. If there are multiple data frames are provided, only the first data frame would be used for training, and the others would be used for testing/validation.

y Name of y variable.

x Name of x variables. Defaults to NULL. If x is NULL, then all columns except y are counted as x variables.

breaks_list A list of break points. It can be extracted from woebin and woebin_adj via the argument save_breaks_list.

special_values The values specified in special_values will be in separate bins. Defaults to NULL.

seed A random seed to split input data frame. Defaults to 618. If it is NULL, input dt will not split into two datasets.

save_report The name of xlsx file where the report is to be saved. Defaults to 'report'.

positive Value of positive class, default "bad|1".

... Additional parameters.
Examples

```r
## Not run:
data("germancredit")

y = 'creditability'
x = c(
  "status.of.existing.checking.account",

    dt3=germancredit[sample(1000,500)]), y, x,
    breaks_list, special_values, seed=NULL, save_report='report5')

## End(Not run)

---

**scorecard**

**Creating a Scorecard**

**Description**

scorecard creates a scorecard based on the results from woebin and glm.

**Usage**

```r
scorecard(bins, model, points0 = 600, odds0 = 1/19, pdo = 50,
    basepoints_eq0 = FALSE, digits = 0)
```

**Arguments**

- **bins**: Binning information generated from woebin function.
- **model**: A glm model object.
- **points0**: Target points, default 600.
- **odds0**: Target odds, default 1/19. Odds = p/(1-p).
- **pdo**: Points to Double the Odds, default 50.
- **basepoints_eq0**: Logical. Defaults to FALSE. If it is TRUE, the basepoints will equally distribute to each variable.
- **digits**: The number of digits after the decimal point for points calculation. Default 0.
Value

A list of scorecard data frames

See Also

scorecard2 scorecard_ply

Examples

# load germancredit data
data("germancredit")

# filter variable via missing rate, iv, identical value rate
dt_sel = var_filter(germancredit, "creditability")

# woe binning -----
bins = woebin(dt_sel, "creditability")
dt_woe = woebin_ply(dt_sel, bins)

# glm -------
m = glm(creditability ~ ., family = binomial(), data = dt_woe)

# Select a formula-based model by AIC
m_step = step(m, direction="both", trace=FALSE)
m = eval(m_step$call)

# scorecard
# Example I # creat a scorecard
card = scorecard(bins, m)
card2 = scorecard2(bins=bins, dt=germancredit, y='creditability',
x=sub('_woe', '', names(coef(m))[-1]))

# credit score
# Example I # only total score
score1 = scorecard_ply(germancredit, card)

# Example II # credit score for both total and each variable
score2 = scorecard_ply(germancredit, card, only_total_score = FALSE)

Description

scorecard2 creates a scorecard based on the results from woebin. It has the same function of scorecard, but without model object input and provided adjustment for oversampling.
scorecard2

Usage

scorecard2(bins, dt, y, x = NULL, posprob_pop = NULL, points0 = 600, 
odds0 = 1/19, pdo = 50, basepoints_eq0 = FALSE, digits = 0, 
return_prob = FALSE, positive = "bad|1", ...)

bins = woebin(dt_sel, "creditability")
dt_woe = woebin_ply(dt_sel, bins)
scorecard_ply

Score Transformation

Description

scorecard_ply calculates credit score using the results from scorecard.

Usage

scorecard_ply(dt, card, only_total_score = TRUE, print_step = 0L, replace_blank_na = TRUE, var_kp = NULL)

Arguments

dt A data frame, which is the original dataset for training model.

card The scorecard generated from the function scorecard.

only_total_score Logical. Defaults to TRUE. If it is TRUE, then the output includes only total credit score; Otherwise, if it is FALSE, the output includes both total and each variable’s credit score.

print_step A non-negative integer. Defaults to 1. If print_step>0, print variable names by each print_step-th iteration. If print_step=0, no message is print.

replace_blank_na Logical. Replace blank values with NA. Defaults to TRUE. This argument should be the same with woebin’s.

var_kp Name of force kept variables, such as id column. Defaults to NULL.
**split_df**

*Split a Data Frame*

**Value**

A data frame in score values

**See Also**

`scorecard` `scorecard2`

**Examples**

```r
# load germancredit data
data(“germancredit”)

# filter variable via missing rate, iv, identical value rate
dt_sel = var_filter(germancredit, “creditability”)

# woe binning -----
bins = woebin(dt_sel, ”creditability”)
dt_woe = woebin_ply(dt_sel, bins)

# glm -----
m = glm(creditability ~ ., family = binomial(), data = dt_woe)

# Select a formula-based model by AIC
m_step = step(m, direction=”both”, trace=FALSE)
m = eval(m_step$call)

# scorecard
# Example I # creat a scorecard
card = scorecard(bins, m)
card2 = scorecard2(bins=bins, dt=germancredit, y=’creditability’,
    x=sub(’_woe’, ’’, names(coef(m))[-1]))

# credit score
# Example I # only total score
score1 = scorecard_ply(germancredit, card)

# Example II # credit score for both total and each variable
score2 = scorecard_ply(germancredit, card, only_total_score = FALSE)
```

**Description**

Split a data frame into multiple data sets according to the specified ratios.
Usage

\[
\text{split\_df}(dt, y = \text{NULL}, \text{ratios} = c(0.7, 0.3), \text{name\_dfs} = c(\text{"train", "test"}), \text{seed} = 618, \ldots)
\]

Arguments

- **dt**: A data frame.
- **y**: Name of y variable, Defaults to NULL. The input data will split based on the predictor y, if it is provided.
- **ratios**: A numeric vector indicating the ratio of total rows contained in each split, defaults to c(0.7, 0.3).
- **name\_dfs**: Name of returned data frames. Its length should equal to the ratios’. Defaults to train and test.
- **seed**: A random seed, Defaults to 618.
- **...**: Additional parameters.

Value

A list of data frames

Examples

```r
# load German credit data
data(germancredit)

# Example I
dt_list = split\_df(germancredit, y="creditability")

# dimensions of each split data sets
lapply(dt_list, dim)

# Example II
dt_list2 = split\_df(germancredit, y="creditability",
  ratios = c(0.5, 0.3, 0.2),
  name\_dfs = c(\text{"train", "test", "valid"}))
lapply(dt_list2, dim)
```

---

**var\_filter**

**Variable Filter**

Description

This function filters variables based on specified conditions, such as information value, missing rate, identical value rate.
Usage

```r
var_filter(dt, y, x = NULL, iv_limit = 0.02, missing_limit = 0.95,
    identical_limit = 0.95, var_rm = NULL, var_kp = NULL,
    return_rm_reason = FALSE, positive = "bad|1")
```

Arguments

- `dt`: A data frame with both `x` (predictor/feature) and `y` (response/label) variables.
- `y`: Name of `y` variable.
- `x`: Name of `x` variables. Defaults to `NULL`. If `x` is `NULL`, then all columns except `y` are counted as `x` variables.
- `iv_limit`: The information value of kept variables should \( \geq \) `iv_limit`. The Defaults to 0.02.
- `missing_limit`: The missing rate of kept variables should \( \leq \) `missing_limit`. The Defaults to 0.95.
- `identical_limit`: The identical value rate (excluding NAs) of kept variables should \( \leq \) `identical_limit`. The Defaults to 0.95.
- `var_rm`: Name of force removed variables, Defaults to `NULL`.
- `var_kp`: Name of force kept variables, Defaults to `NULL`.
- `return_rm_reason`: Logical, Defaults to `FALSE`.
- `positive`: Value of positive class, Defaults to "bad|1".

Value

A data frame with columns for `y` and selected `x` variables, and a data frame with columns for remove reason if `return_rm_reason == TRUE`.

Examples

```r
# Load German credit data
data(germancredit)

# variable filter
dt_sel = var_filter(germancredit, y = "creditability")
dim(dt_sel)

# return the reason of variable removed
dt_sel2 = var_filter(germancredit, y = "creditability", return_rm_reason = TRUE)
lapply(dt_sel2, dim)

str(dt_sel2$dt)
str(dt_sel2$rm)

# keep columns manually, such as rowid
germancredit$rowid = row.names(germancredit)
dt_sel3 = var_filter(germancredit, y = "creditability", var_kp = 'rowid')
```
# remove columns manually
dt_sel4 = var_filter(germancredit, y = "creditability", var_rm = 'rowid')

### var_scale

**Variable Scaling**

**Description**

scaling variables using standardization or normalization

**Usage**

```r
var_scale(dt, var_skip = NULL, type = "standard", ...)
```

**Arguments**

- `dt`: a data frame or vector
- `var_skip`: Name of variables that will skip for scaling Defaults to NULL.
- `type`: type of scaling method, including standard or minmax.
- `...`: Additional parameters.

**Examples**

```r
data("germancredit")

# standardization
dts1 = var_scale(germancredit, type = "standard")

# normalization/minmax
dts2 = var_scale(germancredit, type = "minmax")
dts2 = var_scale(germancredit, type = "minmax", new_range = c(-1, 1))
```

### vif

**Variance Inflation Factors**

**Description**

vif calculates variance-inflation and generalized variance-inflation factors for linear, generalized linear.

**Usage**

```r
vif(model, merge_coef = FALSE)
```
woebin

Arguments

model A model object.
merge_coef Logical, whether to merge with coefficients of model summary matrix. Defaults to FALSE.

Value

A data frame with columns for variable and gvif, or additional columns for df and gvif^(1/(2*df)) if provided model uses factor variable.

See Also

https://cran.r-project.org/package=car

Examples

data(germancredit)

# Example I
fit1 = glm(creditability~ age.in.years + credit.amount +
    present.residence.since, family = binomial(), data = germancredit)
vif(fit1)
vif(fit1, merge_coef=TRUE)

# Example II
fit2 = glm(creditability~ status.of.existing.checking.account +
    credit.history + credit.amount, family = binomial(), data = germancredit)
vif(fit2)
vif(fit2, merge_coef=TRUE)

woebin WOE Binning

Description

woebin generates optimal binning for numerical, factor and categorical variables using methods including tree-like segmentation or chi-square merge. woebin can also customizing breakpoints if the breaks_list was provided. The default woe is defined as ln(Pos_i/Neg_i). If you prefer ln(Neg_i/Pos_i), please set the argument positive as negative value, such as '0' or 'good'. If there is a zero frequency class when calculating woe, the zero will replaced by 0.99 to make the woe calculable.
Usage

```r
woebin(dt, y, x = NULL, var_skip = NULL, breaks_list = NULL,
special_values = NULL, stop_limit = 0.1, count_distr_limit = 0.05,
bin_num_limit = 8, positive = "bad|1", no_cores = NULL,
print_step = 0L, method = "tree", save_breaks_list = NULL,
ignore_const_cols = TRUE, ignore_datetime_cols = TRUE,
check_cate_num = TRUE, replace_blank_inf = TRUE, ...)
```

Arguments

dt
A data frame with both x (predictor/feature) and y (response/label) variables.
y
Name of y variable.
x
Name of x variables. Defaults to NULL. If x is NULL, then all columns except y and var_skip are counted as x variables.
var_skip
Name of variables that will skip for binning. Defaults to NULL.
brakes_list
List of break points. Defaults to NULL. If it is not NULL, variable binning will be based on the provided breaks.
special_values
the values specified in special_values will be in separate bins. Defaults to NULL.
stop_limit
Stop binning segmentation when information value gain ratio less than the 'stop_limit' if using tree method; or stop binning merge when the chi-square of each neighbor bins are larger than the threshold under significance level of 'stop_limit' and freedom degree of 1 if using chimerge method. Accepted range: 0-0.5; Defaults to 0.1. If it is 'N', each x value is a bin.
count_distr_limit
The minimum count distribution percentage. Accepted range: 0.01-0.2; Defaults to 0.05.
bin_num_limit
Integer. The maximum number of binning. Defaults to 8.
positive
Value of positive class, defaults to "bad|1".
no_cores
Number of CPU cores for parallel computation. Defaults to 90 percent of total cpu cores.
print_step
A non-negative integer. Defaults to 1. If print_step>0, print variable names by each print_step-th iteration. If print_step=0 or no_cores>1, no message is print.
method
Four methods are provided, "tree" and "chimerge" for optimal binning that support both numerical and categorical variables, and 'width' and 'freq' for equal binning that support numerical variables only. Defaults to "tree".
save_breaks_list
A string. The file name to save breaks_list. Defaults to None.
ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.
ignore_datetime_cols
Logical. Ignore datetime columns. Defaults to TRUE.
check_cate_num
Logical. Check whether the number of unique values in categorical columns larger than 50. It might make the binning process slow if there are too many unique categories. Defaults to TRUE.
replace_blank_inf
Logical. Replace blank values with NA and infinite with -1. Defaults to TRUE.

Value
A list of data frames include binning information for each x variables.

  purpose = c("education", "others%,%missing")
)
bins_cus_brk = woebin(dat, y="creditability",
  x=c("age.in.years","credit.amount","housing","purpose"),
  breaks_list=breaks_list, special_values=special_values)

# Example V
# save breaks_list as a R file
bins2 = woebin(germancredit, y="creditability",
  x=c("credit.amount","housing"), save_breaks_list="breaks_list")

# Example VI
# setting bin closed on the right
options(scorecard.bin_close_right = TRUE)
binsRight = woebin(germancredit, y = 'creditability', x = 'age.in.years')
# setting bin close on the left, the default setting
options(scorecard.bin_close_right = FALSE)

## End(Not run)

woebin_adj

WOE Binning Adjustment

Description

woebin_adj interactively adjust the binning breaks.

Usage

woebin_adj(dt, y, bins, adj_all_var = TRUE, special_values = NULL,
  method = "tree", save_breaks_list = NULL, count_distr_limit = 0.05,
  to = "breaks_list", ...)
Arguments

dt      A data frame.
y      Name of y variable.
bins    A list of data frames. Binning information generated from woebin.
adj_all_var Logical, whether to show variables have monotonic woe trends. Defaults to TRUE
special_values The values specified in special_values will in separate bins. Defaults to NULL.
method    Optimal binning method, it should be "tree" or "chimerge". Defaults to "tree".
save_breaks_list A string. The file name to save breaks_list. Defaults to None.
count_distr_limit The minimum count distribution percentage. Accepted range: 0.01-0.2; Defaults to 0.05. This argument should be the same with woebin’s.
to       Adjusting bins into breaks_list or bins_list. Defaults to breaks_list.
...      Additional parameters.

Value

A list of modified break points of each x variables.

## End(Not run)
woebin_plot  

**WOE Binning Visualization**

**Description**

`woebin_plot` creates plots of count distribution and positive probability for each bin. The binning information is generated by `woebin`.

**Usage**

```r
woebin_plot(bins, x = NULL, title = NULL, show_iv = TRUE, line_value = "posprob", ...)
```

**Arguments**

- `bins`: A list of data frames. Binning information generated by `woebin`.
- `x`: Name of x variables. Defaults to `NULL`. If `x` is `NULL`, then all columns except `y` are counted as x variables.
- `title`: String added to the plot title. Defaults to `NULL`.
- `show_iv`: Logical. Defaults to `TRUE`, which means show information value in the plot title.
- `line_value`: The value displayed as line. Accepted values are 'posprob' and 'woe'. Defaults to positive probability.
- `...`: Additional parameters

**Value**

A list of binning graphics.

**See Also**

`woebin`, `woebin_ply`, `woebin_adj`

**Examples**

```r
# Load German credit data
data(germancredit)

# Example I
bins1 = woebin(germancredit, y="creditability", x="credit.amount")

pl = woebin_plot(bins1)
print(pl)

# modify line value
pl_w = woebin_plot(bins1, line_value = 'woe')
print(pl_w)
```
# modify colors
p1_c = woebin_plot(bins1, line_color='#FC8D59', bar_color=c('#FFFFBF', '#99D594'))
print(p1_c)

# show iv, line value, bar value
p1_iv = woebin_plot(bins1, show_iv = FALSE)
print(p1_iv)
p1_lineval = woebin_plot(bins1, show_lineval = FALSE)
print(p1_lineval)
p1_barval = woebin_plot(bins1, show_barval = FALSE)
print(p1_barval)

# Example II
bins = woebin(germancredit, y="creditability")
plotlist = woebin_plot(bins)
print(plotlist$credit.amount)

# # save binning plot
# for (i in 1:length(plotlist)) {
#   ggsave(
#     paste0(names(plotlist[[i]]), ".png"), plotlist[[i]],
#     width = 15, height = 9, units="cm" )
# }

woebin_ply  WOE/BIN Transformation

Description

woebin_ply converts original values of input data into woe or bin based on the binning information generated from woebin.

Usage

woebin_ply(dt, bins, to = "woe", no_cores = NULL, print_step = 0L, replace_blank_inf = TRUE, ...)

Arguments

dt  A data frame.

bins  Binning information generated from woebin.

to  Converting original values to woe or bin. Defaults to woe.

no_cores  Number of CPU cores for parallel computation. Defaults to 90 percent of total cpu cores.
print_step A non-negative integer. Defaults to 1. If print_step > 0, print variable names by each print_step-th iteration. If print_step = 0 or no_cores > 1, no message is print.

replace_blank_inf Logical. Replace blank values with NA and infinite with -1. Defaults to TRUE. This argument should be the same with woebin's.

Value
A data frame with columns for variables converted into woe values.
