Package ‘srvyr’

March 28, 2021

Type Package

Title 'dplyr'-Like Syntax for Summary Statistics of Survey Data

Description Use piping, verbs like 'group_by' and 'summarize', and other 'dplyr' inspired syntactic style when calculating summary statistics on survey data using functions from the 'survey' package.

Version 1.0.1

Date 2021-03-28

BugReports https://github.com/gergness/srvyr/issues

Depends R (>= 3.1.2)

Imports dplyr (>= 0.7), magrittr, rlang, survey, tibble, tidyverse, tidyselect

License GPL-2 | GPL-3

Suggests convey, DBI, dbplyr, ggplot2, knitr, laeken, Matrix, rmarkdown (>= 2.2.2), pander, RSQLite, survival, testthat

Encoding UTF-8

VignetteBuilder knitr

RoxygenNote 7.1.1

NeedsCompilation no

as_survey Create a tbl_svy from a data.frame

Description

as_survey can be used to create a tbl_svy using design information (as_survey_design), replicate weights (as_survey_rep), or a two phase design (as_survey_twophase), or an object created by the survey package.
as_survey

Usage

as_survey(.data, ...)

## S3 method for class 'tbl_svy'
as_survey(.data, ...)

## S3 method for class 'data.frame'
as_survey(.data, ...)

## S3 method for class 'tbl_lazy'
as_survey(.data, ...)

## S3 method for class 'survey.design2'
as_survey(.data, ...)

## S3 method for class 'svyrep.design'
as_survey(.data, ...)

## S3 method for class 'twophase2'
as_survey(.data, ...)

Arguments

.data a data.frame or an object from the survey package
... other arguments, see other functions for details

Details

See vignette("databases",package = "dplyr") for more information on setting up databases in dplyr.

Value

a tbl_svy

Examples

# Examples from ?survey::svydesign
library(survey)
library(dplyr)
data(api)

# stratified sample
dstrata <- apistrat %>%
    as_survey(strata = stype, weights = pw)

# Examples from ?survey::svrepdesign
data(scd)
# use BRR replicate weights from Levy and Lemeshow
scd$rep1 <- 2 * c(1, 0, 1, 0, 1, 0)
as_survey_design

Create a tbl_svy survey object using sampling design

Description

Create a survey object with a survey design.

Usage

as_survey_design(.data, ...)

## S3 method for class 'data.frame'
as_survey_design(
  .data,
  ids = NULL,
  probs = NULL,
  strata = NULL,
  variables = NULL,
  fpc = NULL,
  nest = FALSE,
  check_strata = !nest,
  weights = NULL,
  pps = FALSE,
  variance = c("HT", "YG"),
)
as_survey_design

... )

## S3 method for class 'survey.design2'
as_survey_design(.data, ...)

## S3 method for class 'tbl_lazy'
as_survey_design(
  .data,
  ids = NULL,
  probs = NULL,
  strata = NULL,
  variables = NULL,
  fpc = NULL,
  nest = FALSE,
  check_strata = !nest,
  weights = NULL,
  pps = FALSE,
  variance = c("HT", "YG"),
  ...
)

Arguments

.data A data frame (which contains the variables specified below)

... ignored

ids Variables specifying cluster ids from largest level to smallest level (leaving the argument empty, NULL, 1, or 0 indicate no clusters).

probs Variables specifying cluster sampling probabilities.

strata Variables specifying strata.

variables Variables specifying variables to be included in survey. Defaults to all variables in .data.

fpc Variables specifying a finite population correct, see svydesign for more details.

nest If TRUE, relabel cluster ids to enforce nesting within strata.

check_strata If TRUE, check that clusters are nested in strata.

weights Variables specifying weights (inverse of probability).

pps "brewer" to use Brewer's approximation for PPS sampling without replacement. "overton" to use Overton's approximation. An object of class HR to use the Hartley-Rao approximation. An object of class ppsmat to use the Horvitz-Thompson estimator.

variance For pps without replacement, use variance="YG" for the Yates-Grundy estimator instead of the Horvitz-Thompson estimator.
Details

If provided a data.frame, it is a wrapper around `svydesign`. All survey variables must be included in the data.frame itself. Variables are selected by using bare column names, or convenience functions described in `select`.

If provided a `survey.design2` object from the survey package, it will turn it into a srvyr object, so that srvyr functions will work with it.

Value

An object of class `tbl_svy`

Examples

```r
# Examples from ?survey::svydesign
library(survey)
data(api)

data(strata <- apistrat %>%
as_survey_design(strata = stype, weights = pw)

data(dclus1 <- apiclus1 %>%
as_survey_design(dnum, weights = pw, fpc = fpc)

data(dclus2 <- apiclus2 %>%
as_survey_design(c(dnum, snum), fpc = c(fpc1, fpc2))

## multistage sampling has no effect when fpc is not given, so
## these are equivalent.
dclus2wr <- apiclus2 %>%
dplyr::mutate(weights = weights(dclus2)) %>%
as_survey_design(c(dnum, snum), weights = weights)

dclus2wr2 <- apiclus2 %>%
dplyr::mutate(weights = weights(dclus2)) %>%
as_survey_design(c(dnum, snum), weights = weights)

## syntax for stratified cluster sample
## (though the data weren't really sampled this way)
apistrat %>% as_survey_design(dnum, strata = stype, weights = pw, 

## PPS sampling without replacement
data(election)
dpps <- election_pps %>%
as_survey_design(fpc = p, pps = "brewer")

# dplyr 0.7 introduced new style of NSE called quosures
# See `vignette("programming", package = "dplyr")` for details
st <- quo(stype)
wt <- quo(pw)
dstrata <- apistrat %>%
  as_survey_design(strata = !!st, weights = !!wt)

---

**as_survey_rep**

Create a `tbl_svy` survey object using replicate weights

**Description**

Create a survey object with replicate weights.

**Usage**

```r
as_survey_rep(.data, ...)
```

```r
## S3 method for class 'data.frame'
as_survey_rep(
  .data,
  variables = NULL,
  repweights = NULL,
  weights = NULL,
  type = c("BRR", "Fay", "JK1", "JKn", "bootstrap", "other"),
  combined_weights = TRUE,
  rho = NULL,
  bootstrap_average = NULL,
  scale = NULL,
  rscales = NULL,
  fpc = NULL,
  fpctype = c("fraction", "correction"),
  mse = getOption("survey.replicates.mse"),
  ...
)
```

```r
## S3 method for class 'tbl_lazy'
as_survey_rep(
  .data,
  variables = NULL,
  repweights = NULL,
  weights = NULL,
  type = c("BRR", "Fay", "JK1", "JKn", "bootstrap", "other"),
  combined_weights = TRUE,
  rho = NULL,
  bootstrap_average = NULL,
  scale = NULL,
  rscales = NULL,
```
fpc = NULL,
fpctype = c("fraction", "correction"),
mse = getOption("survey.replicates.mse"),
...
)

## S3 method for class 'svyrep.design'
as_survey_rep(.data, ...)

## S3 method for class 'survey.design2'
as_survey_rep(
  .data,
type = c("auto", "JK1", "JKn", "BRR", "bootstrap", "subbootstrap", "mrbbootstrap", "Fay"),
rho = 0,
fpc = NULL,
fpctype = NULL,
..., compress = TRUE,
mse = getOption("survey.replicates.mse")
)

## S3 method for class 'tbl_svy'
as_survey_rep(
  .data,
type = c("auto", "JK1", "JKn", "BRR", "bootstrap", "subbootstrap", "mrbbootstrap", "Fay"),
rho = 0,
fpc = NULL,
fpctype = NULL,
..., compress = TRUE,
mse = getOption("survey.replicates.mse")
)

Arguments

- `.data` A data frame (which contains the variables specified below)
- `...` ignored
- `variables` Variables to include in the design (default is all)
- `repweights` Variables specifying the replication weight variables
- `weights` Variables specifying sampling weights
- `type` Type of replication weights
- `combined_weights` TRUE if the `repweights` already include the sampling weights. This is usually the case.
- `rho` Shrinkage factor for weights in Fay’s method
**as_survey_rep**

`bootstrap_average`  
For `type = "bootstrap"`, if the bootstrap weights have been averaged, gives the number of iterations averaged over.

`scale, rscales`  
Scaling constant for variance, see `svrepdesign` for more information.

`fpc, fpctype`  
Finite population correction information

`mse`  
if TRUE, compute variances based on sum of squares around the point estimate, rather than the mean of the replicates

`compress`  
if TRUE, store replicate weights in compressed form (if converting from design)

**Details**

If provided a data.frame, it is a wrapper around `svrepdesign`. All survey variables must be included in the data.frame itself. Variables are selected by using bare column names, or convenience functions described in `select`.

If provided a `svyrep.design` object from the survey package, it will turn it into a `srvyr` object, so that `srvyr` functions will work with it.

If provided a survey design (`survey::design2` or `tbl_svy`), it is a wrapper around `as.svrepdesign`, and will convert from a survey design to replicate weights.

**Value**

An object of class `tbl_svy`

**Examples**

```r
# Examples from ?survey::svrepdesign()  
library(survey)  
library(dplyr)  
data(scd)  
# use BRR replicate weights from Levy and Lemeshow  
scd <- scd %>%
  mutate(rep1 = 2 * c(1, 0, 1, 0, 1, 0),
         rep2 = 2 * c(1, 0, 0, 1, 0, 1),
         rep3 = 2 * c(0, 1, 1, 0, 0, 1),
         rep4 = 2 * c(0, 1, 0, 1, 0))

scdrep <- scd %>%
  as_survey_rep(type = "BRR", repweights = starts_with("rep"),
                combined_weights = FALSE)

# dplyr 0.7 introduced new style of NSE called quosures  
# See 'vignette("programming", package = "dplyr")' for details  
repwts <- quo(starts_with("rep"))  
scdrep <- scd %>%
  as_survey_rep(type = "BRR", repweights = !!repwts,
                combined_weights = FALSE)
```
as_survey_twophase

Create a tbl_svy survey object using two phase design

Description

Create a survey object by specifying the survey’s two phase design. It is a wrapper around twophase. All survey variables must be included in the data.frame itself. Variables are selected by using bare column names, or convenience functions described in select.

Usage

as_survey_twophase(.data, ...)

## S3 method for class 'data.frame'
as_survey_twophase(  
  .data,  
  id,  
  strata = NULL,  
  probs = NULL,  
  weights = NULL,  
  fpc = NULL,  
  subset,  
  method = c("full", "approx", "simple"),  
  ...  
)

## S3 method for class 'twophase2'
as_survey_twophase(.data, ...)

Arguments

.data  
A data frame (which contains the variables specified below)

...  
ignored

id  
list of two sets of variable names for sampling unit identifiers

strata  
list of two sets of variable names (or NULLs) for stratum identifiers

probs  
list of two sets of variable names (or NULLs) for sampling probabilities

weights  
Only for method = "approx", list of two sets of variable names (or NULLs) for sampling weights

fpc  
list of two sets of variables (or NULLs for finite population corrections

subset  
bare name of a variable which specifies which observations are selected in phase 2

method  
"full" requires (much) more memory, but gives unbiased variance estimates for general multistage designs at both phases. "simple" or "approx" use less memory, and is correct for designs with simple random sampling at phase one and stratified randoms sampling at phase two. See twophase for more details.
as_tibble

Value

An object of class tbl_svy

Examples

# Examples from ?survey::twophase
# two-phase simple random sampling.
data(pbc, package="survival")
library(dplyr)

    pbc <- pbc %>%
    mutate(randomized = !is.na(trt) & trt > 0,
           id = row_number())
    d2pbc <- pbc %>%
    as_survey_twophase(id = list(id, id), subset = randomized)

d2pbc %>% summarize(mean = survey_mean(bili))

# two-stage sampling as two-phase
library(survey)
data(mu284)

    mu284_1 <- mu284 %>%
    dplyr::slice(c(1:15, rep(1:5, n2[1:5] - 3))) %>%
    mutate(id = row_number(),
           sub = rep(c(TRUE, FALSE), c(15, 34-15)))

    dmu284 <- mu284 %>%
    as_survey_design(ids = c(id1, id2), fpc = c(n1, n2))
# first phase cluster sample, second phase stratified within cluster
    d2mu284 <- mu284_1 %>%
    as_survey_twophase(id = list(id1, id), strata = list(NULL, id1),
                       fpc = list(n1, NULL), subset = sub)

    dmu284 %>%
    summarize(total = survey_total(y1),
              mean = survey_mean(y1))

    d2mu284 %>%
    summarize(total = survey_total(y1),
              mean = survey_mean(y1))

# dplyr 0.7 introduced new style of NSE called quosures
# See `vignette("programming", package = "dplyr")` for details
    ids <- quo(list(id, id))
    d2pbc <- pbc %>%
    as_survey_twophase(id = !!ids, subset = "randomized")

as_tibble

Coerce survey variables to a data frame (tibble)
cascade

Description

Coerce survey variables to a data frame (tibble)

Arguments

x

A tbl_svy object

cascade Summarise multiple values into cascading groups

Description

cascade is similar to summarise, but calculates a summary statistics for the total of a group in addition to each group.

Usage

cascade(.data, ..., .dots, .fill = NA)

Arguments

.data, tbl A tbl_svy object

... Name-value pairs of summary functions

dots Used to work around non-standard evaluation. See vignette("nse",package = "dplyr") for details.

.fill Value to fill in for group summaries

Examples

library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)
dstrata_grp <- dstrata %>%
  group_by(stype)
dstrata_grp %>%
cascade(api99_mn = survey_mean(api99), api00_mn = survey_mean(api00), api_diff = survey_mean(api00 - api99))
**collect**

**Force computation of a database query**

**Description**

collect retrieves data from a database query (and when run on a tbl_svy object adjusts weights accordingly). Use collect when you want to run a function from the survey package on a srvyr db backed object. compute stores results in a remote temporary table.

**cur_svy**

**Get the survey data for the current context**

**Description**

This is a helper to allow srvyr's syntactic style. In particular, it tells functions inside of a summarize call what survey to use (for the current group with cur_svy() or the complete survey for cur_svy_full()). In general, users will not have to worry about getting (or setting) the current context's survey, unless they are trying to extend srvyr. See vignette("extending-srvyr") for more details. current_svy() is deprecated, but returns the same value as cur_svy().

**Usage**

cur_svy()

cur_svy_full()

current_svy()

**Value**

a tbl_svy (or error if called with no survey context)

**get_var_est**

**Get the variance estimates for a survey estimate**

**Description**

This is a helper to allow srvyr's syntactic style. In general, users will not have to worry about getting survey variance estimates directly unless they are trying to extend srvyr. This function helps convert from the result of a survey function into a data.frame with an estimate and measures of variance around it in a way that summarize expects. See vignette("extending-srvyr") for more details.
Usage

```r
get_var_est(
  stat,
  vartype,
  grps = "",
  level = 0.95,
  df = Inf,
  pre_calc_ci = FALSE,
  deff = FALSE
)
```

Arguments

- **stat**
  A survey statistic object, usually the result of a function from the survey package or svyby.

- **vartype**
  A vector indicating which variance estimates to calculate (options are se for standard error, ci for confidence interval, var for variance or cv for coefficient of variation). Multiples are allowed.

- **grps**
  A vector indicating the names of the grouping variables for grouped surveys ("" indicates no groups).

- **level**
  One or more levels to calculate a confidence interval.

- **df**
  Degrees of freedom, many survey functions default to Inf, but srvyr functions generally default to the result of calling degf on the survey object.

- **pre_calc_ci**
  Whether the confidence interval is pre-calculated (as in svyciprop)

- **deff**
  Whether to return the design effect (calculated using survey:::deff)

Value

A tbl_svy with the variables modified

Description

These functions do not perform non-standard evaluation, and so are useful when programming against tbl objects. ungroup is a convenient inline way of removing existing grouping.

Arguments

- **x**
  data tbl_df or tbl_svy object.

See Also

- **groups** for information.
group_by

Group a (survey) dataset by one or more variables.

Description

Most data operations are useful when done on groups defined by variables in the dataset. The `group_by` function takes an existing table (or `svy_table`) and converts it to a grouped version, where operations are performed "by group".

Arguments

- `.data` A tbl
- `...` variables to group by. All tbls accept variable names, some will also accept functions of variables. Duplicated groups will be silently dropped.
- `add` By default, when `add = FALSE`, `group_by` will override existing groups. To instead add to the existing groups, use `add = TRUE`.
- `.dots` Used to work around non-standard evaluation. See vignette("nse",package = "dplyr") for details.

Details

See `group_by` for more information about grouping regular data tables.

On `tbl_svy` objects, `group_by` sets up the object for operations similar to those allowed in `svyby`.

See Also

- `group_by` for information about `group_by` on normal data tables.

Examples

```r
# Examples of svy_tbl group_by
library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw) %>%
  group_by(stype)

dstrata %>%
  summarise(api_diff = survey_mean(api00 - api99))
```
group_map_dfr

Apply a function to each group

Description

group_map(). group_walk and group_map_dfr are purrr-style functions that can be used to iterate on grouped survey objects (note that group_map_dfr replaces dplyr::group_modify because we are changing the data from a tbl_svy to a regular tibble).

Usage

group_map_dfr(.data, .f, ..., .keep = FALSE)

## S3 method for class 'tbl_svy'
group_map(.data, .f, ..., .keep = FALSE)

group_map_dfr(.data, .f, ..., .keep = FALSE)

Arguments

.data A tbl_svy object
.f A function or purrr-style formula to apply to each group
... Other arguments passed to .f
.keep Whether the grouping variables are kept when passed into .f

Value

For group_map a list, for group_map_dfr a ‘tbl_df’; and for group_walk invisibly the original tbl_svy.

Examples

data(api, package = "survey")
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)

results <- dstrata %>%
  group_by(both) %>
  group_map(~survey::svyglm(api00~api99 + stype, .))

# group_map_dfr calls `bind_rows` on the list returned and includes # grouping variables. This is most useful with a package like `broom` # but could also be used with survey package functions.
result_coef <- dstrata %>%
  group_by(both) %>
  group_map_dfr(~data.frame(
    api99_coef = coef(survey::svyglm(api00~api99 + stype, .))[["api99"]])
Single table verbs from dplyr and tidyr

Description

These are data manipulation functions designed to work on tbl_svy objects.

Details

- **mutate** and **transmute** can add or modify variables. See **mutate** for more details.
- **select**, **rename**, and **rename_with** keep or rename variables. See **select** for more details.
- **pull** extracts a variable as a vector (whereas **select** returns a tbl_svy). See **pull** for more details.
- **filter** keeps certain observations. See **filter** for more details.
- `# drop_na` drops observations containing missing values. See **drop_na** for more details.
- **arrange** is not implemented for tbl_svy objects. Nor are any two table verbs such as **bind_rows**, **bind_cols** or any of the joins (**full_join**, **left_join**, etc.). These data manipulations may require modifications to the survey variable specifications and so cannot be done automatically. Instead, use dplyr to perform them while the data is still stored in data.frames.

set_survey_vars

Set the variables for the current survey variable

Description

This is a helper to allow srvyr’s syntactic style. In general, users will not have to worry about setting variables in a survey object unless they are trying to extend srvyr. This function helps convert a vector to a variable in the correct part of a survey object’s structure so that functions can refer to it using the survey package’s formula notation. See vignette("extending-srvyr") for more details.

Usage

set_survey_vars(.svy, x, name = "__SRVYR_TEMP_VAR__", add = FALSE)

Arguments

- `.svy` A survey object
- `x` A vector to be included in the variables portion of the survey object
- `name` The name of the variable once it is added. Defaults to `__SRVYR_TEMP_VAR__` which is formatted weirdly to avoid name collisions.
- `add` FALSE, the default, overwrite all current variables. If TRUE, will add this variable instead.
Value

a tbl_svy with the variables modified

---

**srvyr**

*srvyr*: A package for 'dplyr'-Like Syntax for Summary Statistics of Survey Data.

---

**Description**

The srvyr package provides a new way of calculating summary statistics on survey data, based on the dplyr package. There are three stages to using srvyr functions, creating a survey object, manipulating the data, and calculating survey statistics.

**Functions to create a survey object**

*as_survey_design*, *as_survey_rep*, and *as_survey_twophase* are used to create surveys based on a data.frame and design variables, replicate weights or two phase design respectively. Each is based on a function in the survey package (*svydesign*, *svrepdesign*, *twophase*), and it is easy to modify code that uses the survey package so that it works with the srvyr package. See vignette("srvyr_vs_survey") for more details.

The function *as_survey* will choose between the other three functions based on the arguments given to save some typing.

**Functions to manipulate data in a survey object**

Once you've created a survey object, you can manipulate the data as you would using dplyr with a data.frame. *mutate* modifies or creates a variable, *select* and *rename* select or rename variables, and *filter* keeps certain observations.

Note that *arrange* and two table verbs such as *bind_rows*, *bind_cols*, or any of the joins are not usable on survey objects because they might require modifications to the definition of your survey. If you need to use these functions, you should do so before you convert the data.frame to a survey object.

**Functions to summarize a survey object**

Now that you have your data set up correctly, you can calculate summary statistics. To get the statistic over the whole population, use *summarise*, or to calculate it over a set of groups, use *group_by* first.

You can calculate the mean, (with *survey_mean*), the total (*survey_total*), the quantile (*survey_quantile*), or a ratio (*survey_ratio*). By default, srvyr will return the statistic and the standard error around it in a data.frame, but with the vartype parameter, you can also get a confidence interval ("ci"), variance ("var"), or coefficient of variation ("cv").

Within summarise, you can also use *unweighted*, which calculates a function without taking into consideration the survey weighting.
srvyr-se-deprecated

Deprecated SE versions of main srvyr verbs

Description
	srvyr has updated its standard evaluation semantics to match dplyr 0.7, so these underscore functions are no longer required (but are still supported for backward compatibility reasons). See `se-deprecated` or the dplyr vignette on programming (`vignette("programming", package = "dplyr")`) for more details.

Usage

```r
as_survey_(.data, ...)

as_survey_design_(
  .data,
  ids = NULL,
  probs = NULL,
  strata = NULL,
  variables = NULL,
  fpc = NULL,
  nest = FALSE,
  check_strata = !nest,
  weights = NULL,
  pps = FALSE,
  variance = c("HT", "YG")
)

as_survey_rep_(
  .data,
  variables = NULL,
  repweights = NULL,
  weights = NULL,
  type = c("BRR", "Fay", "JK1", "JKn", "bootstrap", "other"),
  combined_weights = TRUE,
  rho = NULL,
  bootstrap_average = NULL,
  scale = NULL,
  rscales = NULL,
  fpc = NULL,
  fpctype = c("fraction", "correction"),
  mse = getOption("survey.replicates.mse")
)

as_survey_twophase_(
  .data,
  id,
```
strata = NULL,
probs = NULL,
weights = NULL,
fpc = NULL,
subset,
method = c("full", "approx", "simple")
)

cascade_(.data, ..., .dots, .fill = NA)

Arguments

.data          a data.frame or an object from the survey package
...            other arguments, see other functions for details
ids            Variables specifying cluster ids from largest level to smallest level (leaving the
                argument empty, NULL, 1, or 0 indicate no clusters).
probs          Variables specifying cluster sampling probabilities.
strata          Variables specifying strata.
variables      Variables specifying variables to be included in survey. Defaults to all variables
                in .data
fpc            Variables specifying a finite population correct, see svydesign for more details.
nest           If TRUE, relabel cluster ids to enforce nesting within strata.
check_strata   If TRUE, check that clusters are nested in strata.
weights        Variables specifying weights (inverse of probability).
pps            "brewer" to use Brewer's approximation for PPS sampling without replacement.
                "overton" to use Overton's approximation. An object of class HR to use the
                Hartley-Rao approximation. An object of class ppsmat to use the Horvitz-
                Thompson estimator.
variance       For pps without replacement, use variance="YG" for the Yates-Grundy estima-
                tor instead of the Horvitz-Thompson estimator
repweights     Variables specifying the replication weight variables
type           Type of replication weights
combined_weights TRUE if the repweights already include the sampling weights. This is usually
                the case.
rho            Shrinkage factor for weights in Fay’s method
bootstrap_average For type = "bootstrap", if the bootstrap weights have been averaged, gives the
                number of iterations averaged over.
scale          Scaling constant for variance, see svrepdesign for more information.
rscales        Scaling constant for variance, see svrepdesign for more information.
fpctype         Finite population correction information
### summarise

Summarise multiple values to a single value.

#### Description

Summarise multiple values to a single value.

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>.data</code></td>
<td>tbl A tbl_svy object</td>
</tr>
<tr>
<td><code>...</code></td>
<td>Name-value pairs of summary functions</td>
</tr>
<tr>
<td><code>.groups</code></td>
<td>Defaults to &quot;drop_last&quot; in srvyr meaning that the last group is peeled off, but if there are more groups they will be preserved. Other options are &quot;drop&quot;, which drops all groups, &quot;keep&quot; which keeps all of them and &quot;rowwise&quot; which converts the object to a rowwise object (meaning calculations will be performed on each row).</td>
</tr>
<tr>
<td><code>.unpack</code></td>
<td>Whether to &quot;unpack&quot; named data.frame columns. srvyr predates dplyr’s support for data.frame columns so it does not treat them the same way by default.</td>
</tr>
</tbody>
</table>

#### Details

Summarise for tbl_svy objects accepts several specialized functions. Each of the functions a variable (or two, in the case of `survey_ratio`), from the data.frame and default to providing the measure and its standard error.

The argument `vartype` can choose one or more measures of uncertainty, `se` for standard error, `ci` for confidence interval, `var` for variance, and `cv` for coefficient of variation. `level` specifies the level for the confidence interval.

The other arguments correspond to the analogus function arguments from the survey package.

The available functions from srvyr are:

- `survey_mean` Calculate the survey mean of the entire population or by groups. Based on `svymean`.  

survey_total  Calculate the survey total of the entire population or by groups. Based on svytotal.
survey_ratio  Calculate the ratio of 2 variables in the entire population or by groups. Based on svyratio.
survey_quantile  Calculate quantiles in the entire population or by groups. Based on svyquantile.
survey_median  Calculate the median in the entire population or by groups. svyquantile.
unweighted  Calculate an unweighted estimate as you would on a regular tbl_df. Based on dplyr’s summarise.

Examples

library(survey)
data(api)

dstrata <- api strat %>%
as_survey_design(strata = stype, weights = pw)

dstrata %>%
summarise(api99_mn = survey_mean(api99), api00_mn = survey_mean(api00), api_diff = survey_mean(api00 - api99))

dstrata_grp <- dstrata %>%
group_by(stype)

dstrata_grp %>%
summarise(api99_mn = survey_mean(api99), api00_mn = survey_mean(api00), api_diff = survey_mean(api00 - api99))

summarise_all  Manipulate multiple columns.

Description

See summarize_all for more details. *_each functions will be deprecated in favor of *_all/_if/_at functions.

survey_mean  Calculate the mean and its variation using survey methods

Description

Calculate means and proportions from complex survey data. A wrapper around svymean, or if proportion = TRUE, svyciprop. survey_mean should always be called from summarise.
Usage

```r
survey_mean(
  x,
  na.rm = FALSE,
  vartype = c("se", "ci", "var", "cv"),
  level = 0.95,
  proportion = FALSE,
  prop_method = c("logit", "likelihood", "asin", "beta", "mean"),
  deff = FALSE,
  df = NULL,
  ...
)
```

```r
survey_prop(
  vartype = c("se", "ci", "var", "cv"),
  level = 0.95,
  proportion = FALSE,
  prop_method = c("logit", "likelihood", "asin", "beta", "mean"),
  deff = FALSE,
  df = NULL,
  ...
)
```

Arguments

- **x** A variable or expression, or empty
- **na.rm** A logical value to indicate whether missing values should be dropped
- **vartype** Report variability as one or more of: standard error ("se", default), confidence interval ("ci"), variance ("var") or coefficient of variation ("cv").
- **level** (For `vartype = "ci"` only) A single number or vector of numbers indicating the confidence level
- **proportion** Use methods to calculate the proportion that may have more accurate confidence intervals near 0 and 1. Based on `svyciprop`.
- **prop_method** Type of proportion method to use if proportion is TRUE. See `svyciprop` for details.
- **deff** A logical value to indicate whether the design effect should be returned.
- **df** (For `vartype = "ci"` only) A numeric value indicating the degrees of freedom for t-distribution. The default (NULL) uses `deff`, but Inf is the usual survey package's default (except in `svyciprop`.
- **...** Ignored

Examples

```r
library(survey)
data(api)
```
survey_quantile <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)

dstrata %>%
  summarise(api99_mn = survey_mean(api99),
             api_diff = survey_mean(api00 - api99, vartype = c("ci", "cv")))

dstrata %>%
  group_by(awards) %>%
  summarise(api00 = survey_mean(api00))

# Leave x empty to calculate the proportion in each group

dstrata %>%
  group_by(awards) %>%
  summarise(pct = survey_mean())

# Setting proportion = TRUE uses a different method for calculating confidence intervals

dstrata %>%
  summarise(high_api = survey_mean(api00 > 875, proportion = TRUE, vartype = "ci"))

# level takes a vector for multiple levels of confidence intervals

dstrata %>%
  summarise(api99 = survey_mean(api99, vartype = "ci", level = c(0.95, 0.65)))

# Note that the default degrees of freedom in srvyr is different from
# survey, so your confidence intervals might not be exact matches. To
# Replicate survey's behavior, use df = Inf

dstrata %>%
  summarise(survey_default = survey_mean(api99, vartype = "ci"),
             srvyr_default = survey_mean(api99, vartype = "ci", df = Inf))

comparison <- survey::svymean(~api99, dstrata)
confint(comparison) # survey's default
confint(comparison, df = survey::degf(dstrata)) # srvyr's default

survey_quantile

Calculate the quantile and its variation using survey methods

Description

Calculate quantiles from complex survey data. A wrapper around svyquantile. survey_quantile
and survey_median should always be called from summarise.

Usage

survey_quantile(
  x,
  quantiles,
  na.rm = FALSE,
survey_quantile

vartype = c("se", "ci", "var", "cv"),
level = 0.95,
q_method = "linear",
f = 1,
interval_type = c("Wald", "score", "betaWald", "probability", "quantile"),
ties = c("discrete", "rounded"),
df = NULL,
...)

survey_median(
  x,
  na.rm = FALSE,
  vartype = c("se", "ci"),
  level = 0.95,
  q_method = "linear",
  f = 1,
  interval_type = c("Wald", "score", "betaWald", "probability", "quantile"),
  ties = c("discrete", "rounded"),
  df = NULL,
  ...)

Arguments

  x             A variable or expression
  quantiles    A vector of quantiles to calculate
  na.rm         A logical value to indicate whether missing values should be dropped
  vartype       NULL to report no variability (default), otherwise one or more of: standard
e               error ("se") confidence interval ("ci") (variance and coefficient of variation not
available).
  level         A single number indicating the confidence level (only one level allowed)
  q_method      See "method" in approxfun
  f             See approxfun
  interval_type See svyquantile
  ties          See svyquantile
  df            A number indicating the degrees of freedom for t-distribution. The default, Inf
               uses the normal distribution (matches the survey package). Also, has no effect
               for type = "betaWald".
  ...           Ignored

Examples

library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)

dstrata %>%
  summarise(api99 = survey_quantile(api99, c(0.25, 0.5, 0.75)),
             api00 = survey_median(api00, vartype = c("ci")))

dstrata %>%
  group_by(awards) %>%
  summarise(api00 = survey_median(api00))

---

**survey_ratio**

*Calculate the ratio and its variation using survey methods*

**Description**

Calculate ratios from complex survey data. A wrapper around *svyratio*. *survey_ratio* should always be called from *summarise*.

**Usage**

```r
survey_ratio(
  numerator,
  denominator,
  na.rm = FALSE,
  vartype = c("se", "ci", "var", "cv"),
  level = 0.95,
  deff = FALSE,
  df = NULL,
  ...)
```

**Arguments**

- **numerator**: The numerator of the ratio
- **denominator**: The denominator of the ratio
- **na.rm**: A logical value to indicate whether missing values should be dropped
- **vartype**: Report variability as one or more of: standard error ("se", default), confidence interval ("ci"), variance ("var") or coefficient of variation ("cv").
- **level**: A single number or vector of numbers indicating the confidence level
- **deff**: A logical value to indicate whether the design effect should be returned.
- **df** (For `vartype = "ci"` only) A numeric value indicating the degrees of freedom for t-distribution. The default (NULL) uses `degf`, but Inf is the usual survey package's default (except in `svyciprop`).
- **...**: Ignored
Examples

```r
library(survey)
data(api)

dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)

  dstrata %>%
  summarise(enroll = survey_ratio(api00, api99, vartype = c("ci", "cv")))

  dstrata %>%
  group_by(awards) %>%
  summarise(api00 = survey_ratio(api00, api99))

  # level takes a vector for multiple levels of confidence intervals
  dstrata %>%
  summarise(enroll = survey_ratio(api99, api00, vartype = "ci", level = c(0.95, 0.65)))

  # Note that the default degrees of freedom in srvyr is different from
  # survey, so your confidence intervals might not exactly match. To
  # replicate survey's behavior, use df = Inf
  dstrata %>%
  summarise(srvyr_default = survey_total(api99, vartype = "ci"),
            survey_default = survey_total(api99, vartype = "ci", df = Inf))

comparison <- survey::svytotal(~api99, dstrata)
confint(comparison) # survey's default
confint(comparison, df = survey::degf(dstrata)) # srvyr's default
```

### survey_tally

**Count/tally survey weighted observations by group**

**Description**

Analogous to `tally` and `count`, calculates the survey weighted count of observations. `survey_tally` will call `survey_total` empty (resulting in the count of each group) or on `wt` if it is specified (resulting in the survey weighted total of `wt`). `survey_count` is similar, but calls `group_by` before calculating the count and then returns the data to the original groupings.

**Usage**

```r
survey_tally(
  x,
  wt,
  sort = FALSE,
  name = "n",
  vartype = c("se", "ci", "var", "cv")
)
```
survey_count(
  x,
  ..., 
  wt = NULL,
  sort = FALSE,
  name = "n",
  .drop = dplyr::group_by_drop_default(x),
  vartype = c("se", "ci", "var", "cv")
)

Arguments

x  A tbl_svy object, as created by as_survey and related functions.
wt (Optional) A variable to weight on (in addition to the survey weights, which are always used). If left unspecified, tally() will use a variable named "n" if one exists, but count() will not. Override this behavior by specifying wt = NULL.
sort Whether to sort the results (defaults to FALSE)
name Name of count variable created (defaults to n). If the variable already exists, will add "n" to the end until it does not.
vartype What types variation estimates to calculate, passed to survey_total.
... Variables to group by, passed to group_by().
.drop When .drop = TRUE, empty groups are dropped, see group_by documentation for more details.

Details

If n already exists, tally will use it as the weight, but count will not.

Examples

library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)
dstrata %>%
  group_by(awards) %>%
survey_tally()
dstrata %>%
survey_count(awards)
survey_total  

*Calculate the total and its variation using survey methods*

**Description**

Calculate totals from complex survey data. A wrapper around `svytotal`. `survey_total` should always be called from `summarise`.

**Usage**

```r
survey_total(
  x,
  na.rm = FALSE,
  vartype = c("se", "ci", "var", "cv"),
  level = 0.95,
  deff = FALSE,
  df = NULL,
  ...
)
```

**Arguments**

- `x`  
  A variable or expression, or empty
- `na.rm`  
  A logical value to indicate whether missing values should be dropped
- `vartype`  
  Report variability as one or more of: standard error ("se", default), confidence interval ("ci"), variance ("var") or coefficient of variation ("cv").
- `level`  
  A single number or vector of numbers indicating the confidence level
- `deff`  
  A logical value to indicate whether the design effect should be returned.
- `df`  
  (For `vartype` = "ci" only) A numeric value indicating the degrees of freedom for t-distribution. The default (NULL) uses `degf`, but Inf is the usual survey package's default.
- `...`  
  Ignored

**Examples**

```r
library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)
dstrata %>%
  summarise(enroll_tot = survey_total(enroll),
             tot_meals = survey_total(enroll * meals / 100, vartype = c("ci", "cv")))
```
group_by(awards) %>%
  summarise(api00 = survey_total(enroll))

# Leave x empty to calculate the total in each group
dstrata %>%
  group_by(awards) %>%
  summarise(pct = survey_total())

# level takes a vector for multiple levels of confidence intervals
dstrata %>%
  summarise(enroll = survey_total(enroll, vartype = "ci", level = c(0.95, 0.65)))

# Note that the default degrees of freedom in srvyr is different from
data, so your confidence intervals might not exactly match. To
# replicate survey's behavior, use df = Inf
dstrata %>%
  summarise(srvyr_default = survey_total(api99, vartype = "ci"),
            survey_defualt = survey_total(api99, vartype = "ci", df = Inf))

comparison <- survey::svytotal(~api99, dstrata)
confint(comparison) # survey's default
confint(comparison, df = survey::degf(dstrata)) # srvyr's default

---

**survey_var**

*Calculate the population variance and its variation using survey methods*

**Description**

Calculate population variance from complex survey data. A wrapper around `svyvar`. `survey_var` should always be called from `summarise`.

**Usage**

```r
survey_var(
x,
  na.rm = FALSE,
  vartype = c("se", "ci", "var"),
  level = 0.95,
  df = NULL,
  ...
)
```

```r
survey_sd(x, na.rm = FALSE, ...)
```

**Arguments**

- **x**: A variable or expression, or empty
survey_var

na.rm A logical value to indicate whether missing values should be dropped
vartype Report variability as one or more of: standard error ("se", default) or variance ("var") (confidence intervals and coefficient of variation not available).
level (For vartype = "ci" only) A single number or vector of numbers indicating the confidence level.
df (For vartype = "ci" only) A numeric value indicating the degrees of freedom for t-distribution. The default (Inf) is equivalent to using normal distribution and in case of population variance statistics there is little reason to use any other values (see Details).

... Ignored

Details

Be aware that confidence intervals for population variance statistic are computed by package survey using t or normal (with df=Inf) distribution (i.e. symmetric distributions). **This could be a very poor approximation** if even one of these conditions is met:

- there are few sampling design degrees of freedom,
- analyzed variable isn’t normally distributed,
- there is huge variation in sampling probabilities of the survey design.

Because of this be very careful using confidence intervals for population variance statistics especially while performing analysis within subsets of data or using grouped survey objects.

Sampling distribution of the variance statistic in general is asymmetric (chi-squared in case of simple random sampling of normally distributed variable) and if analyzed variable isn’t normally distributed or there is huge variation in sampling probabilities of the survey design (or both) it could converge to normality only very slowly (with growing number of survey design degrees of freedom).

Examples

library(survey)
data(api)
dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)
dstrata %>%
  summarise(api99_var = survey_var(api99),
              api99_sd = survey_sd(api99))
dstrata %>%
  group_by(awards) %>%
  summarise(api00_var = survey_var(api00),
             api00_sd = survey_sd(api00))

# standard deviation and variance of the population variance estimator
# are available with vartype argument
# (but not for the population standard deviation estimator)
dstrata %>%
  summarise(api99_variance = survey_var(api99, vartype = c("se", "var")))
### svychisq

**Chisquared tests of association for survey data.**

#### Description

Chisquared tests of association for survey data.

#### Arguments

- `formula` See details in `svychisq`
- `design` See details in `svychisq`
- `na.rm` See details in `svychisq`
- `...` See details in `svychisq`

### tbl_svy

**tbl_svy object.**

#### Description

A `tbl_svy` wraps a locally stored svydesign and adds methods for dplyr single-table verbs like `mutate`, `group_by` and `summarise`. Create a `tbl_svy` using `as_survey_design`.

#### Methods

`tbl_df` implements these methods from dplyr.

- `select` or `rename` Select or rename variables in a survey’s dataset.
- `mutate` or `transmute` Modify and create variables in a survey’s dataset.
- `group_by` and `summarise` Get descriptive statistics from survey.

#### Examples

```r
library(survey)
library(dplyr)
data(api)
svy <- as_survey_design(apiistrat, strata = stype, weights = pw)
svy

# Data manipulation verbs -----------------------------------------------
filter(svy, pcttest > 95)
select(svy, starts_with("acs")) # variables used in survey design are automatically kept
summarise(svy, col.grad = survey_mean(col.grad))
mutate(svy, api_diff = api00 - api99)

# Group by operations -----------------------------------------------------
```

# To calculate survey
svy_group <- group_by(svy, dname)
summarise(svy, col.grad = survey_mean(col.grad),
api00 = survey_mean(api00, vartype = "ci"))

## tbl_vars

**tbl_vars**

*List variables produced by a tbl.*

### Description

List variables produced by a tbl.

### Arguments

- **x**
  
  A tbl object

## unweighted

**unweighted**

*Calculate the an unweighted summary statistic from a survey*

### Description

Calculate unweighted summaries from a survey dataset, just as on a normal data.frame with `summarise`. Though it is possible to use regular functions directly, because the survey package doesn’t always remove rows when filtering (instead setting the weight to 0), this can sometimes give bad results. See examples for more details.

### Usage

`unweighted(x, ...)`

### Arguments

- **x**
  
  A variable or expression

- **...**
  
  Ignored

### Details

Uses tidy evaluation semantics and so if you want to use wrapper functions based on variable names, you must use tidy evaluation, see the examples here, documentation in `nse-force`, or the dplyr vignette called `programming` for more information.
Examples

```r
library(survey)
library(dplyr)

data(api)

dstrata <- apistrat %>%
  as_survey_design(strata = stype, weights = pw)

dstrata %>%
  summarise(api99_unw = unweighted(mean(api99)),
           n = unweighted(n()))

dstrata %>%
  group_by(stype) %>%
  summarise(api_diff_unw = unweighted(mean(api00 - api99)))

# Some survey designs, like ones with raked weights, are not removed
# when filtered to preserve the structure. So if you don't use `unweighted`
# your results can be wrong.
# Declare basic clustered design ----
cluster_design <- as_survey_design(
  .data = apiclus1,
  id = dnum,
  weights = pw,
  fpc = fpc)

# Add raking weights for school type ----
pop.types <- data.frame(stype=c("E","H","M"), Freq=c(4421,755,1018))
pop.schwide <- data.frame(sch.wide=c("No","Yes"), Freq=c(1072,5122))
raked_design <- rake(
  cluster_design,
  sample.margins = list(~stype,~sch.wide),
  population.margins = list(pop.types, pop.schwide))

raked_design %>%
  filter(cname != "Alameda") %>%
  group_by(cname) %>%
  summarize(
    direct_unw_mean = mean(api99),
    wrapped_unw_mean = unweighted(mean(api99))
  ) %>%
  filter(cname == "Alameda")

# Notice how the results are different when using `unweighted()`
```
