Package ‘targets’

July 21, 2021

Title Dynamic Function-Oriented ’Make’-Like Declarative Workflows

Description As a pipeline toolkit for Statistics and data science in R, the ’targets’ package brings together function-oriented programming and ’Make’-like declarative workflows. It analyzes the dependency relationships among the tasks of a workflow, skips steps that are already up to date, runs the necessary computation with optional parallel workers, abstracts files as R objects, and provides tangible evidence that the results match the underlying code and data. The methodology in this package borrows from GNU ’Make’ (2015, ISBN: 978-9881443519) and ’drake’ (2018, <doi:10.21105/joss.00550>).

## targets-package

**targets: Dynamic Function-Oriented Make-Like Declarative Pipelines for R**

### Description

As a pipeline toolkit for Statistics and data science in R, the targets package brings together function-oriented programming and Make-like declarative pipelines. It analyzes the dependency relationships among the tasks of a workflow, skips steps that are already up to date, runs the necessary computations with optional parallel workers, abstracts files as R objects, and provides tangible evidence that the results match the underlying code and data. The methodology in this package borrows from GNU Make (2015, ISBN:978-9881443519) and drake by Will Landau (2018, doi: 10.21105/joss.00550).

---

### tar_assert

**Assertions**

### Description

These functions assert the correctness of user inputs and generate custom error conditions as needed. Useful for writing packages built on top of targets.
Usage

tar_assert_chr(x, msg = NULL)
tar_assert_dbl(x, msg = NULL)
tar_assert_df(x, msg = NULL)
tar_assert_equal_lengths(x, msg = NULL)
tar_assert_envir(x, msg = NULL)
tar_assert_expr(x, msg = NULL)
tar_assert_flag(x, choices, msg = NULL)
tar_assert_function(x, msg = NULL)
tar_assert_ge(x, threshold, msg = NULL)
tar_assert_identical(x, y, msg = NULL)
tar_assert_in(x, choices, msg = NULL)
tar_assert_not_dirs(x, msg = NULL)
tar_assert_not_dir(x, msg = NULL)
tar_assert_not_in(x, choices, msg = NULL)
tar_assert_inherits(x, class, msg = NULL)
tar_assert_int(x, msg = NULL)
tar_assert_internet(msg = NULL)
tar_assert_lang(x, msg = NULL)
tar_assert_le(x, threshold, msg = NULL)
tar_assert_list(x, msg = NULL)
tar_assert_lgl(x, msg = NULL)
tar_assert_name(x)
tar_assert_names(x, msg = NULL)
tar_assert_nonempty(x, msg = NULL)
tar_assert_not_expr(x, msg = NULL)

A valid assertion function.

Arguments

- **x**: R object, input to be validated. The kind of object depends on the specific assertion function called.
- **msg**: Character of length 1, a message to be printed to the console if x is invalid.
- **choices**: Character vector of choices of x for certain assertions.
- **threshold**: Numeric of length 1, lower/upper bound for assertions like tar_assert_le()/tar_assert_ge().
- **y**: R object, value to compare against x.
- **class**: Character vector of expected class names.
- **package**: Character of length 1, name of an R package.
- **path**: Character, file path.
- **pattern**: Character of length 1, a grep pattern for certain assertions.

See Also

Other utilities to extend targets: tar_condition, tar_dir(), tar_language, tar_test()

Examples

tar_assert_chr("123")
try(tar_assert_chr(123))
Description

Given a branching pattern, use available metadata to reconstruct branch names and the names of each branch’s dependencies. The metadata of each target must already exist and be consistent with the metadata of the other targets involved.

Usage

tar_branches(name, pattern, store = targets::tar_config_get("store"))

Arguments

name  Symbol, name of the target.

pattern  Language to define branching for a target. For example, in a pipeline with numeric vector targets x and y, tar_target(z, x + y, pattern = map(x, y)) implicitly defines branches of z that each compute x[1] + y[1], x[2] + y[2], and so on. See the user manual for details.

store  Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

The results from this function can help you retroactively figure out correspondences between upstream branches and downstream branches. However, it does not always correctly predict what the names of the branches will be after the next run of the pipeline. Dynamic branching happens while the pipeline is running, so we cannot always know what the names of the branches will be in advance (or even how many there will be).

Value

A tibble with one row per branch and one column for each target (including the branched-over targets and the target with the pattern.)

See Also

Other branching: tar_branch_index(), tar_branch_names_raw(), tar_branch_names(), tar_pattern()
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, head(letters, 2)),
        tar_target(z, head(LETTERS, 2)),
        tar_target(dynamic, c(x, y, z), pattern = cross(z, map(x, y)))
      ), ask = FALSE
    }, ask = FALSE)
  tar_make()
  tar_branches(dynamic, pattern = cross(z, map(x, y)))
}
```

---

**tar_branch_index**

**Integer branch indexes**

**Description**

Get the integer indexes of individual branch names within their corresponding dynamic branching targets.

**Usage**

```r
tar_branch_index(names, store = targets::tar_config_get("store"))
```

**Arguments**

- `names`: Character vector of branch names
- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

A named integer vector of branch indexes.

**See Also**

Other branching: `tar_branch_names_raw()`, `tar_branch_names()`, `tar_branches()`, `tar_pattern()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(
      list(
        tar_target(x, seq_len(4)),
        tar_target(y, 2 * x, pattern = map(x)),
        tar_target(z, y, pattern = map(y))
      ), ask = FALSE)
  }
  tar_make()
  names <- c(
    tar_meta(y, children)$children[[1]][c(2, 3)],
    tar_meta(z, children)$children[[1]][2]
  )
  names
  tar_branch_index(names) # c(2, 3, 2)
}
```

---

### Description

Get the branch names of a dynamic branching target using numeric indexes.

### Usage

```r
tar_branch_names(name, index, store = targets::tar_config_get("store"))
```

### Arguments

- **name**: Symbol, name of the dynamic branching target (pattern).
- **index**: Integer vector of branch indexes.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

### Value

A character vector of branch names.

### See Also

- Other branching: `tar_branch_index()`, `tar_branch_names_raw()`, `tar_branches()`, `tar_pattern()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(4)),
        tar_target(y, 2 * x, pattern = map(x)),
        tar_target(z, y, pattern = map(y))
      ), ask = FALSE)
    tar_make()
    tar_branch_names(z, c(2, 3))
  })
}
```

---

tar_branch_names_raw  Branch names (raw version)

Description

Get the branch names of a dynamic branching target using numeric indexes. Same as `tar_branch_names()` except name is a character of length 1.

Usage

```
tar_branch_names_raw(name, index, store = targets::tar_config_get("store"))
```

Arguments

- **name**: Character of length 1, name of the dynamic branching target (pattern).
- **index**: Integer vector of branch indexes.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A character vector of branch names.

See Also

Other branching: `tar_branch_index()`, `tar_branch_names()`, `tar_branches()`, `tar_pattern()`
Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
    tar_dir({ # tar_dir() runs code from a temporary directory.
        tar_script({
            list(
                tar_target(w, 1),
                tar_target(x, seq_len(4)),
                tar_target(y, 2 * x, pattern = map(x)),
                tar_target(z, y, pattern = map(y))
            ), ask = FALSE)
        tar_make()
        tar_branch_names_raw("z", c(2, 3))
    })
}

Description

Cancel a target mid-build under a custom condition.

Usage

tar_cancel(condition = TRUE)

Arguments

condition Logical of length 1, whether to cancel the target.

Details

Must be invoked by the target itself. tar_cancel() cannot interrupt a target from another process.

See Also

Other utilities: tar_envir(), tar_group(), tar_name(), tar_path(), tar_seed()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
    tar_dir({ # tar_dir() runs code from a temporary directory.
        tar_script(tar_target(x, tar_cancel(1 > 0)))
    tarmake() # Should cancel target x.
})
}
### tar_condition

**Conditions**

#### Description

These functions throw custom targets-specific error conditions. Useful for error handling in packages built on top of targets.

#### Usage

- `tar_message_run(...)`
- `tar_throw_file(...)`
- `tar_throw_run(...)`
- `tar_throw_validate(...)`
- `tar_warn_deprecate(...)`
- `tar_warn_run(...)`
- `tar_warn_validate(...)`

#### Arguments

- `...`  
  zero or more objects which can be coerced to character (and which are pasted together with no separator) or a single condition object.

#### See Also

Other utilities to extend targets: `tar_assert`, `tar_dir()`, `tar_language`, `tar_test()`

#### Examples

```
try(tar_throw_validate("something is not valid"))
```

### tar_config_get

**Get configuration settings from _targets.yaml.**

#### Description

Read the custom settings in the optional _targets.yaml configuration file at the current project.

#### Usage

```
tar_config_get(name, config = "_targets.yaml")
```
Arguments

name Character of length 1, name of the specific configuration setting to retrieve. If name is "config", then instead of retrieving a specific setting, then tar_config_get() will return the path to the YAML file where those settings are stored for the current R session (default: _targets.yaml).

config Character of length 1, path to the YAML file with all the configuration settings (default: _targets.yaml).

Details

Each project can have an optional YAML configuration file (default: _targets.yaml) with settings specific to a given project. You can write it by hand or modify it with tar_config_set(). The currently supported configuration settings are documented as the arguments of tar_config_set().

Value

The value of the configuration setting from the YAML configuration file (default: _targets.yaml) or the default value if the setting is not available. The data type of the return value depends on your choice of name.

See Also

Other configuration: tar_config_set(), tar_envvars(), tar_option_get(), tar_option_reset(), tar_option_set()

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(list(tar_target(x, 1 + 1)))
    tar_config_get("store") # ".targets"
    store_path <- tempfile()
    tar_config_set(store = store_path)
    tar_config_get("store") # Shows a temp file.
    tar_make() # Writes to the custom data store identified in _targets.yaml.
    tar_read(x) # tar_read() knows about _targets.yaml too.
    file.exists("_targets") # FALSE
    file.exists(store_path) # TRUE
  })
}
```

**tar_config_set**  
Write configuration settings to _targets.yaml.

**Description**

tar_config_set() writes special custom settings to an optional project-level YAML configuration file (default: _targets.yaml). Most of these settings are default arguments shared across multiple functions called outside _targets.R.
Usage

tar_config_set(
    config = "_targets.yaml",
    reporter_make = NULL,
    reporter_outdated = NULL,
    store = NULL,
    shortcut = NULL,
    script = NULL,
    workers = NULL
)

Arguments

config Character of length 1, path to the YAML file with all the configuration settings (default: _targets.yaml).

reporter_make Character of length 1, reporter argument to tar_make() and related functions that run the pipeline.

reporter_outdated Character of length 1, reporter argument to tar_outdated() and related functions that do not run the pipeline.

store Character of length 1, path to the data store of the pipeline. If NULL, the store setting is left unchanged in the YAML configuration file (default: _targets.yaml). Usually, the data store lives at _targets. Set store to a custom directory to specify a path other than _targets/. The path need not exist before the pipeline begins, and it need not end with "_targets", but it must be writeable. For optimal performance, choose a storage location with fast read/write access.

shortcut logical of length 1, default shortcut argument to tar_make() and related functions.

script Character of length 1, path to the target script file that defines the pipeline (_targets.R by default). This path should be either an absolute path or a path relative to the project root where you will call tar_make() and other functions. When tar_make() and friends run the script from the current working directory.

workers Positive numeric of length 1, workers argument of tar_make_clustermq() and related functions that run the pipeline with parallel computing among targets.

Details

Each project can have an optional YAML configuration file (default: _targets.yaml at the project root) with settings specific to a given project. You can either write it by hand or modify it with tar_config_set(), but tar_config_set() is recommended because it has guardrails to validate user input. The currently supported configuration settings are documented as the arguments of tar_config_set().

tar_config_set() always writes a YAML file with a full set of configuration settings even when no arguments are supplied. To reset options completely, simply call tar_config_set(config = "_targets.yaml") and remove _targets.yaml if it exists.
**tar_cue**

Value

NULL (invisibly)

See Also

Other configuration: `tar_config_get()`, `tar_envvars()`, `tar_option_get()`, `tar_option_reset()`, `tar_option_set()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(list(tar_target(x, 1 + 1)))
    tar_config_get("store") # NULL (data store defaults to ",_targets/"
    store_path <- tempfile()
    tar_config_set(store = store_path)
    tar_config_get("store") # Shows a temp file.
    tar_make() # Writes to the custom data store identified in _targets.yaml.
    tar_read(x) # tar_read() knows about _targets.yaml too.
    file.exists("_targets") # FALSE
    file.exists(store_path) # TRUE
  })
}
```

---

**tar_cue**

Declare the rules that cue a target.

Description

Declare the rules that mark a target as outdated.

Usage

```r
tar_cue(
  mode = c("thorough", "always", "never"),
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  iteration = TRUE,
  file = TRUE
)
```

Arguments

- **mode**
  - Cue mode. If "thorough", all the cues apply unless individually suppressed. If "always", then the target always runs. If "never", then the target does not run unless the metadata does not exist or the last run errored.

- **command**
  - Logical, whether to rerun the target if command changed since last time.
depend Logical, whether to rerun the target if the value of one of the dependencies changed.

format Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through `tar_target()` or `tar_option_set()`.

iteration Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through `tar_target()` or `tar_option_set()`.

file Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

Target invalidation rules

targets uses internal metadata and special cues to decide whether a target is up to date (can skip) or is outdated/invalidated (needs to rerun). By default, targets moves through the following list of cues and declares a target outdated if at least one is cue activated.

1. There is no metadata record of the target.
2. The target errored last run.
3. The target has a different class than it did before.
4. The cue mode equals "always".
5. The cue mode does not equal "never".
6. The command metadata field (the hash of the R command) is different from last time.
7. The depend metadata field (the hash of the immediate upstream dependency targets and global objects) is different from last time.
8. The storage format is different from last time.
9. The iteration mode is different from last time.
10. A target’s file (either the one in _targets/objects/ or a dynamic file) does not exist or changed since last time.

The user can suppress many of the above cues using the `tar_cue()` function, which creates the cue argument of `tar_target()`. Cues objects also constitute more nuanced target invalidation rules. The tarchetypes package has many such examples, including `tar_age()`, `tar_download()`, `tar_cue_age()`, `tar_cue_force()`, and `tar_cue_skip()`.

Dependency-based invalidation and user-defined functions

If the cue of a target has depend = TRUE (default) then the target is marked invalidated/ outdated when its upstream dependencies change. A target’s dependencies include upstream targets, user-defined functions, and other global objects populated in the target script file (default: _targets.R). To determine if a given dependency changed since the last run of the pipeline, targets computes hashes. The hash of a target is computed on its files in storage (usually a file in _targets/objects/). The hash of a non-function global object dependency is computed directly on its in-memory data. User-defined functions arehashed in the following way:

1. Deparse the function with `targets:::tar_deparse_safe()`. This function computes a string representation of the function body and arguments. This string representation is invariant to changes in comments and whitespace, which means trivial changes to formatting do not cue targets to rerun.
2. Manually remove any literal pointers from the function string using `targets::mask_pointers()`. Such pointers arise from inline compiled C/C++ functions.

3. Using static code analysis (i.e. `tar_deps()`, which is based on `codetools::findGlobals()`) identify any user-defined functions and global objects that the current function depends on. Append the hashes of those dependencies to the string representation of the current function.

4. Compute the hash of the final string representation using `targets::digest_chr64()`.

Above, (3) is important because user-defined functions have dependencies of their own, such as other user-defined functions and other global objects. (3) ensures that a change to a function’s dependencies invalidates the function itself, which in turn invalidates any calling functions and any targets downstream with the `depend` cue turned on.

See Also

Other targets: `tar_target_raw()`, `tar_target()`

Examples

```r
# The following target will always run when the pipeline runs.
x <- tar_target(x, download_data(), cue = tar_cue(mode = "always"))
```

---

**tar_delete**

*Delete locally stored target return values.*

Delete the return values of targets in `_targets/objects/`. but keep the records in `_targets/meta/meta`. Dynamic files and cloud data (e.g. `format = "file"` and `format = "aws_parquet"`) are not deleted.

**Usage**

```
tar_delete(names, store = targets::tar_config_get("store"))
```

**Arguments**

- **names**: Names of the targets to remove from `_targets/objects/`. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

For patterns recorded in the metadata, all the branches will be deleted. For patterns no longer in the metadata, branches are left alone.
See Also

Other clean: `tar_destroy()`, `tar_invalidate()`, `tar_prune()`

Examples

```
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      ), ask = FALSE)
    tar_make()
    tar_delete(starts_with("y")) # Only deletes y1 and y2.
    tar_make() # y1 and y2 rebuild but return same values, so z is up to date.
  })
}
```

---

`tar_deps`

**Code dependencies**

**Description**

List the dependencies of a function or expression.

**Usage**

`tar_deps(expr)`

**Arguments**

`expr` A quoted R expression or function.

**Details**

`targets` detects the dependencies of commands using static code analysis. Use `tar_deps()` to run the code analysis and see the dependencies for yourself.

**Value**

Character vector of the dependencies of a function or expression.

**See Also**

Other inspect: `tar_deps_raw()`, `tar_glimpse()`, `tar_manifest()`, `tar_network()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`, `tar_visnetwork()`
Examples

tar_deps(x <- y + z)
tar_deps({
  x <- 1
  x + a
})
tar_deps(function(a = b) map_dfr(data, ~do_row(.x)))

Description

Same as `tar_deps()` except `expr` must already be an unquoted function or expression object.

Usage

tar_deps_raw(expr)

Arguments

expr An R expression object or function.

Value

Character vector of the dependencies of a function or expression.

See Also

Other inspect: `tar_deps()`, `tar_glimpse()`, `tar_manifest()`, `tar_network()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`, `tar_visnetwork()`

Examples

tar_deps_raw(quote(x <- y + z))
tar_deps_raw(
  quote({
    x <- 1
    x + a
  })
)
tar_deps_raw(function(a = b) map_dfr(data, ~do_row(.x)))
**Description**

Destroy all or part of the data store written by `tar_make()` and similar functions.

**Usage**

```r
 tar_destroy(
   destroy = c("all", "meta", "process", "progress", "objects", "scratch", "workspaces"),
   ask = NULL,
   store = targets::tar_config_get("store")
)
```

**Arguments**

- **destroy**: Character of length 1, what to destroy. Choices:
  - "all": destroy the entire data store (default: _targets/)
  - "meta": just delete the metadata file at meta/meta in the data store, which invalidates all the targets but keeps the data.
  - "process": just delete the progress data file at meta/process in the data store, which resets the metadata of the main process.
  - "progress": just delete the progress data file at meta/progress in the data store, which resets the progress tracking info.
  - "objects": delete all the target return values in objects/ in the data store but keep progress and metadata. Dynamic files are not deleted this way.
  - "scratch": temporary files saved during `tar_make()` that should automatically get deleted except if R crashed.
  - "workspaces": compressed files in workspaces/ in the data store with the saved workspaces of targets. See `tar_workspace()` for details.

- **ask**: Logical of length 1, whether to pause with a menu prompt before deleting files. To disable this menu, set the TAR_ASK environment variable to "false". `usethis::edit_r_environ()` can help set environment variables.

- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to _targets/. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

Nothing.
**tar_dir**

Execute code in a temporary directory.

---

### Description

Runs code inside a new `tempfile()` directory in order to avoid writing to the user's file space. Used in examples and tests in order to comply with CRAN policies.

### Usage

```
tar_dir(code)
```

### Arguments

- **code**: User-defined code.

### Value

Return value of the user-defined code.

### See Also

Other utilities to extend targets: `tar_assert`, `tar_condition`, `tar_language`, `tar_test()`

### Examples

```
tar_dir(file.create("only_exists_in_tar_dir"))
file.exists("only_exists_in_tar_dir")
```
**tar_edit**

*Open the target script file for editing.*

**Description**

Open the target script file for editing. Requires the `usethis` package.

**Usage**

```r
tar_edit(script = targets::tar_config_get("script"))
```

**Arguments**

- **script**
  
  Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**Details**

The target script file is an R code file that defines the pipeline. The default path is `_targets.R`, but the default for the current project can be configured with `tar_config_set()`.

**See Also**

Other scripts: `tar_github_actions()`, `tar_helper_raw()`, `tar_helper()`, `tar_renv()`, `tar_script()`

---

**tar_engine_knitr**

*Target Markdown knitr engine*

**Description**

`knitr` language engine that runs `{targets}` code chunks in Target Markdown.

**Usage**

```r
tar_engine_knitr(options)
```

**Arguments**

- **options**
  
  A named list of `knitr` chunk options.

**Value**

Character, output generated from `knitr::engine_output()`.
Target Markdown chunk options

Target Markdown introduces the following knitr code chunk options. Most other standard knitr code chunk options should just work.

- **tarGlobals**: Logical of length 1, whether to define globals or targets. If TRUE, the chunk code defines functions, objects, and options common to all the targets. If FALSE or NULL (default), then the chunk returns formal targets for the pipeline.

- **tarInteractive**: Logical of length 1, whether to run in interactive mode or non-interactive mode. Defaults to the return value of interactive().

- **tarName**: name to use for writing helper script files (e.g. _targets_r/targets/target_script.R) and specifying target names if the tarSimple chunk option is TRUE. All helper scripts and target names must have unique names, so please do not set this option globally with knitr::opts_chunk$set().

- **tarScript**: Character of length 1, where to write the target script file in non-interactive mode. Most users can skip this option and stick with the default _targets.R script path. Helper script files are always written next to the target script in a folder with an "_r" suffix. The tarScript path must either be absolute or be relative to the project root (where you call tar_make() or similar). If not specified, the target script path defaults to tar_config_get("script") (default: _targets.R; helpers default: _targets_r/). When you run tar_make() etc. with a non-default target script, you must select the correct target script file either with the script argument or with tar_config_set(script = ...). The function will source() the script file from the current working directory (i.e. with chdir = FALSE in source()).

- **tarSimple**: Logical of length 1. Set to TRUE to define a single target with a simplified interface. In code chunks with tarSimple equal to TRUE, the chunk label (or the tarName chunk option if you set it) becomes the name, and the chunk code becomes the command. In other words, a code chunk with label targetname and command mycommand() automatically gets converted to tar_target(name = targetname,command = mycommand()). All other arguments of tar_target() remain at their default values (configurable with tar_option_set() in a tarGlobals = TRUE chunk).

See Also

https://books.ropensci.org/targets/markdown.html

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  # Register the engine.
  if (requireNamespace("knitr", quietly = TRUE)) {
    knitr::knit_engines$set(targets = targets::tar_engine_knitr)
  }
  # Then, [targets] code chunks in a knitr report will run
  # as described at https://books.ropensci.org/targets/markdown.html.
}
tar_envir

For developers only: get the environment of the current target.

Description

For developers only: get the environment where a target runs its command. Inherits from tar_option_get("envir").

Usage

tar_envir(default = parent.frame())

Arguments

default Environment, value to return if tar_envir() is called on its own outside a targets pipeline. Having a default lets users run things without tar_make(), which helps peel back layers of code and troubleshoot bugs.

Details

Users should not call tar_envir() directly because accidental modifications to parent.env(tar_envir()) could break the pipeline. tar_envir() only exists in order to support third-party interface packages such as tarchetypes.

Value

If called from a running target, tar_envir() returns the environment where the target runs its command. If called outside a pipeline, the return value is whatever the user supplies to default (which defaults to parent.frame()).

See Also

Other utilities: tar_cancel(), tar_group(), tar_name(), tar_path(), tar_seed()

Examples

tar_envir()
tar_envir(default = new.env(parent = emptyenv()))
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir(# tar_dir() runs code from a temporary directory.
tar_script(tar_target(x, tar_envir(default = parent.frame())))
tar_make(x)
tar_read(x)
}
**Description**

You can customize the behavior of targets with special environment variables. The sections in this help file describe each environment variable, and the `tar_envvars()` function lists their current values.

**Usage**

```r
tar_envvars(unset = "")
```

**Arguments**

- **unset** Character of length 1, value to return for any environment variable that is not set.

**Details**

If you modify environment variables, please set them in project-level `.Renviron` file so you do not lose your configuration when you restart your R session. Modify the project-level `.Renviron` file with `usethis::edit_r_environ(scope = "project")`. Restart your R session after you are done editing.

**Value**

A data frame with one row per environment variable and columns with the name and current value of each. An unset environment variable will have a value of "" by default. (Customize with the unset argument).

**TAR_ASK**

The `TAR_ASK` environment variable accepts values "true" and "false". If `TAR_ASK` is not set, or if it is set to "true", then `targets` asks permission in a menu before overwriting certain files, such as the target script file (default: _targets.R) in `tar_script()`. If `TAR_ASK` is "false", then `targets` overwrites the old files with the new ones without asking. Once you are comfortable with `tar_script()`, `tar_github_actions()`, and similar functions, you can safely set `TAR_ASK` to "false" in either a project-level or user-level `.Renviron` file.

**TAR_WARN**

The `TAR_WARN` environment variable accepts values "true" and "false". If `TAR_WARN` is not set, or if it is set to "true", then `targets` throws warnings in certain edge cases, such as target/global name conflicts and dangerous use of `devtools::load_all()`. If `TAR_WARN` is "false", then `targets` does not throw warnings in these cases. These warnings are harmless, and they can detect potentially serious issues with your pipeline, so please do not set `TAR_WARN` unless your use case absolutely requires it.

\textbf{tar\_exist\_meta} \hspace{1cm} \textit{Check if target metadata exists.}

Description

Check if the target metadata file \_targets/meta/meta exists for the current project.

Usage

tar\_exist\_meta(store = targets::tar\_config\_get("store"))

Arguments

\begin{itemize}
  \item \texttt{store} \hspace{1cm} Character of length 1, path to the \texttt{targets} data store. Defaults to \texttt{tar\_config\_get("store")}, which in turn defaults to \_targets/\. When you set this argument, the value of \texttt{tar\_config\_get("store")} is temporarily changed for the current function call. See \texttt{tar\_config\_get()} and \texttt{tar\_config\_set()} for details about how to set the data store path persistently for a project.
\end{itemize}

Details

To learn more about local storage in \texttt{targets}, visit \url{https://books.ropensci.org/targets/files.html#internal-files}.

Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: \texttt{tar\_exist\_objects()}, \texttt{tar\_exist\_process()}, \texttt{tar\_exist\_progress()}, \texttt{tar\_exist\_script()}

Examples

tar\_exist\_meta()
```
tar_exist_objects  Check if local output data exists for one or more targets.
```

**Description**

Check if the local data files exist in `_targets/objects/` for one or more targets.

**Usage**

```
tar_exist_objects(names, store = targets::tar_config_get("store"))
```

**Arguments**

- `names`  Character vector of target names.
- `store`  Character of length 1, path to the `targets` data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

To learn more about local storage in `targets`, visit [https://books.ropensci.org/targets/files.html#internal-files](https://books.ropensci.org/targets/files.html#internal-files).

**Value**

Logical of length `length(names)`, whether each given target has an existing file in `_targets/objects/` for the current project.

**See Also**

Other existence: `tar_exist_meta()`, `tar_exist_process()`, `tar_exist_progress()`, `tar_exist_script()`

**Examples**

```
tar_exist_objects(c("target1", "target2"))
```
tar_exist_process  

Check if process metadata exists.

Description

Check if the process metadata file _targets/meta/process exists for the current project.

Usage

```
tar_exist_process(store = targets::tar_config_get("store"))
```

Arguments

store  

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to _targets/. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

To learn more about local storage in targets, visit [https://books.ropensci.org/targets/files.html#internal-files](https://books.ropensci.org/targets/files.html#internal-files).

Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_progress()`, `tar_exist_script()`

Examples

```
tar_exist_process()
```

Prepare to punctuate
**tar_exist_script**

Arguments

- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

To learn more about local storage in targets, visit https://books.ropensci.org/targets/files.html#internal-files.

Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_process()`, `tar_exist_script()`

Examples

```r
tar_exist_script()
```

**Description**

Check if the target script file exists for the current project. The target script is `_targets.R` by default, but the path can be configured for the current project using `tar_config_set()`.

**Usage**

```r
tar_exist_script(script = targets::tar_config_get("script"))
```

Arguments

- **script**: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

Value

Logical of length 1, whether the current project’s metadata exists.
**See Also**

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_process()` , `tar_exist_progress()`

**Examples**

```r
tar_exist_script()
```

---

**tar_github_actions**  
*Set up GitHub Actions to run a targets pipeline*

**Description**

Writes a GitHub Actions workflow file so the pipeline runs on every push to GitHub. Historical runs accumulate in the `targets-runs` branch, and the latest output is restored before `tar_make()` so up-to-date targets do not rerun.

**Usage**

```r
tar_github_actions(
  path = file.path(".github", "workflows", "targets.yaml"),
  ask = NULL
)
```

**Arguments**

- `path`  
  Character of length 1, file path to write the GitHub Actions workflow file.
- `ask`  
  Logical, whether to ask before writing if the workflow file already exists. If `NULL`, defaults to `Sys.getenv("TAR_ASK")`. (Set to "true" or "false" with `Sys.setenv()`). If `ask` and the `TAR_ASK` environment variable are both indeterminate, defaults to `interactive()`.

**Details**

Steps to set up continuous deployment:

1. Ensure your pipeline stays within the resource limitations of GitHub Actions and repositories, both for storage and compute. For storage, you may wish to reduce the burden with AWS-backed storage formats like "aws_qs".
2. Ensure Actions are enabled in your GitHub repository. You may have to visit the Settings tab.
3. Call `targets::tar_renv(extras = character(0))` to expose hidden package dependencies.
4. Set up renv for your project (with `renv::init()` or `renv::snapshot()`). Details at [https://rstudio.github.io/renv/articles/ci.html](https://rstudio.github.io/renv/articles/ci.html).
5. Commit the `renv.lock` file to the main (recommended) or master Git branch.
6. Run `tar_github_actions()` to create the workflow file. Commit this file to main (recommended) or master in Git.
7. Push your project to GitHub. Verify that a GitHub Actions workflow runs and pushes results to `targets-runs`. Subsequent runs will only recompute the outdated targets.
Value

Nothing (invisibly). This function writes a GitHub Actions workflow file as a side effect.

See Also

Other scripts: `tar_edit()` , `tar_helper_raw()` , `tar_helper()` , `tar_renv()` , `tar_script()`

Examples

```
tar_glimpse( tempfile() )
```

---

**Description**

Analyze the pipeline defined in the target script file (default: `_targets.R`) and visualize the directed acyclic graph of targets. Unlike `tar_visnetwork()`, `tar_glimpse()` does not account for metadata or progress information, which means the graph renders faster. Also, `tar_glimpse()` omits functions and other global objects by default (but you can include them with `targets_only = FALSE`).

**Usage**

```
tar_glimpse(
  targets_only = TRUE, 
  names = NULL, 
  shortcut = FALSE, 
  allow = NULL, 
  exclude = ".Random.seed",
  level_separation = NULL, 
  degree_from = 1L, 
  degree_to = 1L, 
  callr_function = callr::r, 
  callr_arguments = targets::callr_args_default(callr_function), 
  envir = parent.frame(), 
  script = targets::tar_config_get("script"), 
  store = targets::tar_config_get("store")
)
```

**Arguments**

- `targets_only` Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.

- `names` Names of targets. The graph visualization will operate only on these targets (and unless `shortcut` is TRUE, all the targets upstream as well). Selecting a small subgraph using `names` could speed up the load time of the visualization. Unlike `allow`, `names` is invoked before the graph is generated. Set to NULL to
check/build all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like `starts_with()`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

**shortcut**
Logical of length 1, how to interpret the `names` argument. If `shortcut` is `FALSE` (default) then the function checks all targets upstream of `names` as far back as the dependency graph goes. If `TRUE`, then the function only checks the targets in `names` and uses stored metadata for information about upstream dependencies as needed. `shortcut = TRUE` increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, `shortcut = TRUE` only works if you set `names`.

**allow**
Optional, define the set of allowable vertices in the graph. Unlike `names`, `allow` is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to `NULL` to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like `starts_with()`.

**exclude**
Optional, define the set of exclude vertices from the graph. Unlike `names`, `exclude` is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to `NULL` to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`.

**level_separation**
Numeric of length 1, `levelSeparation` argument of `visNetwork::visHierarchicalLayout()`. Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If `level_separation` is `NULL`, the `levelSeparation` argument of `visHierarchicalLayout()` defaults to 150.

**degree_from**
Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. `degree_from` controls the number of edges the neighborhood extends upstream.

**degree_to**
Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. `degree_to` controls the number of edges the neighborhood extends downstream.

**callr_function**
A function from `callr` to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.

**callr_arguments**
A list of arguments to `callr_function`.

**envir**
An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script.
**Description**

Like `dplyr::group_by()`, but for patterns. `tar_group()` allows you to map or cross over subsets of data frames. Requires `iteration = "group"` on the target. See the example.
Usage

tar_group(x)

Arguments

x  Grouped data frame from dplyr::group_by()

Details

The goal of tar_group() is to post-process the return value of a data frame target to allow downstream targets to branch over subsets of rows. It takes the groups defined by dplyr::group_by() and translates that information into a special tar_group column. tar_group is a vector of positive integers from 1 to the number of groups. Rows with the same integer in tar_group belong to the same group, and branches are arranged in increasing order with respect to the integers in tar_group. The assignment of tar_group integers to group levels depends on the orderings inside the grouping variables and not the order of rows in the dataset. dplyr::group_keys() on the grouped data frame shows how the grouping variables correspond to the integers in the tar_group column.

Value

A data frame with a special tar_group column that targets will use to find subsets of your data frame.

See Also

Other utilities: tar_cancel(), tar_envir(), tar_name(), tar_path(), tar_seed()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
# The tar_group() function simply creates
# a tar_group column to partition the rows
# of a data frame.
data.frame(
    x = seq_len(6),
id = rep(letters[seq_len(3)], each = 2)
) %>%
dplyr::group_by(id) %>%
tar_group()
# We use tar_group() below to branch over
# subsets of a data frame defined with dplyr::group_by().
tar_dir({ # tar_dir() runs code from a temporary directory.
tar_script({
library(dplyr)
list(
    tar_target(
        data,
data.frame(
            x = seq_len(6),
id = rep(letters[seq_len(3)], each = 2)
        )
    )
})
})
}
Write a helper R script.

Description
Write a helper R script for a targets pipeline. Could be supporting functions or the target script file (default: _targets.R) itself.

Usage
tar_helper(path = NULL, code = NULL, tidy_eval = TRUE, envir = parent.frame())

Arguments
- **path**: Character of length 1, path to write (or overwrite) code. If the parent directory does not exist, `tar_helper_raw()` creates it.
- **code**: Quoted code to write to path. `tar_helper()` overwrites the file if it already exists.
- **tidy_eval**: Logical, whether to use tidy evaluation on code. If turned on, you can substitute expressions and symbols using !! and !!!: See examples below.
- **envir**: Environment for tidy evaluation.

Details
tar_helper() is a specialized version of `tar_script()` with flexible paths and tidy evaluation.

Value
NULL (invisibly)
See Also

Other scripts: `tar_edit()`, `tar_github_actions()`, `tar_helper_raw()`, `tar_renv()`, `tar_script()`

Examples

```r
# Without tidy evaluation:
path <- tempfile()
tar_helper(path, x <- 1)
writelines(readlines(path))
# With tidy evaluation:
y <- 123
tar_helper(path, x <- !!y)
writelines(readlines(path))
```

---

tar_helper_raw  Write a helper R script (raw version).

Description

Write a helper R script for a targets pipeline. Could be supporting functions or the target script file (default: _targets.R) itself.

Usage

```r
 tar_helper_raw(path = NULL, code = NULL)
```

Arguments

- `path`: Character of length 1, path to write (or overwrite) code. If the parent directory does not exist, `tar_helper_raw()` creates it.
- `code`: Expression object. `tar_helper_raw()` deparses and writes this code to a file at `path`, overwriting it if the file already exists.

Details

`tar_helper_raw()` is a specialized version of `tar_script()` with flexible paths and tidy evaluation. It is like `tar_helper()` except that code is an "evaluated" argument rather than a quoted one.

Value

`NULL` (invisibly)

See Also

Other scripts: `tar_edit()`, `tar_github_actions()`, `tar_helper()`, `tar_renv()`, `tar_script()`
Examples

```r
path <- tempfile()
tar_helper_raw(path, quote(x <- 1))
writeLines(readLines(path))
```

tar_invalidate

Invalidate targets and global objects in the metadata.

Description

Delete the metadata of records in _targets/meta/meta but keep the return values of targets in _targets/objects/.

Usage

```r
tar_invalidate(names, store = targets::tar_config_get("store"))
```

Arguments

- **names**: Names of the targets to remove from the metadata list. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to _targets/. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

For patterns recorded in the metadata, all the branches will be invalidated. For patterns no longer in the metadata, branches are left alone.

See Also

Other clean: `tar_delete()`, `tar_destroy()`, `tar_prune()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      )
    }, ask = FALSE)
    tar_make()
  }
}

```r

 tar_invalidate(starts_with("y")) # Only invalidates y1 and y2.
 tar_make() # y1 and y2 rebuild but return same values, so z is up to date.
)
}

```

---

### `tar_language`

#### Description

These functions help with metaprogramming in packages built on top of targets.

#### Usage

- `tar_deparse_language(expr)`
- `tar_deparse_safe(expr, collapse = "\n", backtick = TRUE)`
- `tar_tidy_eval(expr, envir, tidy_eval)`
- `tar_tidyselect_eval(names_quosure, choices)`

#### Arguments

- `expr`: A language object to modify or deparse.
- `collapse`: Character of length 1, delimiter in deparsing.
- `backtick`: Logical indicating whether symbolic names should be enclosed in backticks if they do not follow the standard syntax.
- `envir`: An environment to find objects for tidy evaluation.
- `tidy_eval`: Logical of length 1, whether to apply tidy evaluation.
- `names_quosure`: An `rlang` quosure with `tidyselect` expressions.
- `choices`: A character vector of choices for character elements returned by tidy evaluation.

#### Details

- `tar_deparse_language()` is a wrapper around `tar_deparse_safe()` which leaves character vectors and NULL objects alone, which helps with subsequent user input validation.
- `tar_deparse_safe()` is a wrapper around `base::deparse()` with a custom set of fast default settings and guardrails to ensure the output always has length 1.
- `tar_tidy_eval()` applies tidy evaluation to a language object and returns another language object.
- `tar_tidyselect_eval()` applies tidyselect selection with some special guardrails around NULL inputs.
See Also

Other utilities to extend targets: `tar_assert`, `tar_condition`, `tar_dir()`, `tar_test()`

Examples

```r
#tar_deparse_language(quote(run_model()))
```

### Description

Load the return values of targets into the current environment (or the environment of your choosing). For a typical target, the return value lives in a file in `_targets/objects/`. For dynamic files (i.e. `format = "file"`) the paths loaded in place of the values.

### Usage

```r
tar_load(
  names,
  branches = NULL,
  meta = tar_meta(targets_only = TRUE, store = store),
  envir = parent.frame(),
  store = targets::tar_config_get("store")
)
```

### Arguments

- **names**: Names of the targets to load. You can supply symbols, a character vector, or `tidyselect` helpers like `all_of()` and `starts_with()`.
- **branches**: Integer of indices of the branches to load for any targets that are patterns.
- **meta**: Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.
- **envir**: Environment to put the loaded targets.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

### Value

Nothing.
Limited scope

`tar_read()` and `tar_load()` are only for exploratory analysis and literate programming, and `tar_read_raw()` and `tar_load_raw()` are only for exploratory analysis. `targets` automatically loads the correct dependencies into memory when the pipeline is running, so invoking these functions from inside a target is rarely advisable.

See Also

Other data: `tar_load_raw()`, `tar_meta()`, `tar_objects()`, `tar_pid()`, `tar_process()`, `tar_read_raw()`, `tar_read()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      ), ask = FALSE
    }, ask = FALSE)
  tar_make()
  tar_load(starts_with("y")) # see also all_of()
}
}
```

Description

Load user-defined packages, functions, global objects, and settings defined in the target script file (default: `_targets.R`). This function is for debugging, testing, and prototyping only. It is not recommended for use inside a serious pipeline or to report the results of a serious pipeline.

Usage

```r
tar_load Globals

args:

envir:
  Environment to source the target script (default: `_targets.R`). Defaults to the calling environment.
```

Usage

```r

tar_load Globals
Load globals for debugging, testing, and prototyping

Description

Load user-defined packages, functions, global objects, and settings defined in the target script file (default: `_targets.R`). This function is for debugging, testing, and prototyping only. It is not recommended for use inside a serious pipeline or to report the results of a serious pipeline.

Usage

```r

tar_load Globals

args:

envir:
  Environment to source the target script (default: `_targets.R`). Defaults to the calling environment.
```
**Description**

`tar_load_raw` Character of length 1, path to the target script file that defines the pipeline (_targets.R by default). This path should be either an absolute path or a path relative to the project root where you will call `tar_make()` and other functions. When `tar_make()` and friends run the script from the current working directory.

This function first sources the target script file (default: _targets.R) to loads all user-defined functions, global objects, and settings into the current R process. Then, it loads all the packages defined in `tar_option_get("packages")` (default: `.packages()`) using `library()` with `lib.loc` defined in `tar_option_get("library")` (default: NULL).

**Value**

NULL (invisibly).

**See Also**

Other debug: `tar_traceback()`, `tar_workspaces()`, `tar_workspace()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      tar_option_set(packages = "callr")
      analyze_data <- function(data) {
        summary(data)
        list(
          tar_target(x, 1 + 1),
          tar_target(y, 1 + 1)
        )
      }, ask = FALSE)
      tar_load_globals()
      print(analyze_data)
      print("callr" %in% (.packages()))
    })
  }
}
```

**Description**

Same as `tar_load()` except names is a character vector. Do not use in knitr or R Markdown reports with tarchetypes::tar_knit() or tarchetypes::tar_render().
Usage

tar_load_raw(
    names,
    branches = NULL,
    meta = tar_meta(store = store),
    envir = parent.frame(),
    store = targets::tar_config_get("store")
)

Arguments

names Character vector, names of the targets to build or check.
branches Integer of indices of the branches to load for any targets that are patterns.
meta Data frame of metadata from tar_meta(). tar_read() with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call tar_meta() beforehand and supply it to the meta argument, then successive calls to tar_read() may run much faster.
envir Environment to put the loaded targets.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

Nothing.

Limited scope

tar_read() and tar_load() are only for exploratory analysis and literate programming, and tar_read_raw() and tar_load_raw() are only for exploratory analysis. targets automatically loads the correct dependencies into memory when the pipeline is running, so invoking these functions from inside a target is rarely advisable.

See Also

Other data: tar_load(), tar_meta(), tar_objects(), tar_pid(), tar_process(), tar_read_raw(), tar_read()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
      )
    })
  })
}
## Description

Run the pipeline you defined in the targets script file (default: `_targets.R`). `tar_make()` runs the correct targets in the correct order and stores the return values in `_targets/objects/`.

## Usage

```r
 tar_make(  
    names = NULL,  
    shortcut = targets::tar_config_get("shortcut"),  
    reporter = targets::tar_config_get("reporter_make"),  
    callr_function = callr::r,  
    callr_arguments = targets::callr_args_default(callr_function, reporter),  
    envir = parent.frame(),  
    script = targets::tar_config_get("script"),  
    store = targets::tar_config_get("store")  
)  
```

## Arguments

- **names**
  - Names of the targets to build or check. Set to `NULL` to check/build all the targets (default). Otherwise, you can supply symbols, a character vector, or tidyselect helpers like `all_of()` and `starts_with()`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) by not individual dynamic branches.

- **shortcut**
  - Logical of length 1, how to interpret the `names` argument. If `shortcut` is `FALSE` (default) then the function checks all targets upstream of `names` as far back as the dependency graph goes. `shortcut = TRUE` increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. `shortcut = TRUE` only works if you set `names`.

- **reporter**
  - Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to `tar_config_get("reporter_make")`. Choices:
• "verbose": print one message for each target that runs (default).
• "silent": print nothing.
• "timestamp": print a time-stamped message for each target that runs.
• "summary": print a running total of the number of each targets in each status category (queued, started, skipped, build, canceled, or errored). Also show a timestamp ("%H:%M %OS2" strptime() format) of the last time the progress changed and printed to the screen.

callr_function A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments A list of arguments to callr_function.

envir An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

See Also

Other pipeline: tar_make_clustermq(), tar_make_future()
Examples

tar_dir({ # tar_dir() runs code from a temporary directory.
tar_script(
    tar_option_set()
    list(tar_target(x, 1 + 1))
  )
tar_make()
tar_script{
    tar_option_set()
    list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
    )
}, ask = FALSE)
tar_make(starts_with("y")) # Only builds y1 and y2.
})

Description

This function is like `tar_make()` except that targets run in parallel with persistent `clustermq` workers. It requires that you set global options like `clustermq.scheduler` and `clustermq.template` inside the target script file (default: `_targets.R`). `clustermq` is not a strict dependency of `targets`, so you must install `clustermq` yourself.

Usage

tar_make_clustermq(
    names = NULL,
    shortcut = targets::tar_config_get("shortcut"),
    reporter = targets::tar_config_get("reporter_make"),
    workers = targets::tar_config_get("workers"),
    log_worker = FALSE,
    callr_function = callr::r,
    callr_arguments = targets::callr_args_default(callr_function, reporter),
    envir = parent.frame(),
    script = targets::tar_config_get("script"),
    store = targets::tar_config_get("store")
)

Arguments

names Names of the targets to build or check. Set to NULL to check/build all the targets (default). Otherwise, you can supply symbols, a character vector, or
tidyselect helpers like `all_of()` and `starts_with()`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) by not individual dynamic branches.

### shortcut
Logical of length 1, how to interpret the `names` argument. If `shortcut` is `FALSE` (default) then the function checks all targets upstream of `names` as far back as the dependency graph goes. `shortcut = TRUE` increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. `shortcut = TRUE` only works if you set `names`.

### reporter
Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to `tar_config_get("reporter_make")`. Choices:
- "verbose": print one message for each target that runs (default).
- "silent": print nothing.
- "timestamp": print a time-stamped message for each target that runs.
- "summary": print a running total of the number of each targets in each status category (queued, started, skipped, build, canceled, or errored). Also show a timestamp ("%H:%M %OS2" `strptime()` format) of the last time the progress changed and printed to the screen.

### workers
Positive integer, number of persistent `clustermq` workers to create.

### log_worker
Logical, whether to write a log file for each worker. Same as the `log_worker` argument of `clustermq::Q()` and `clustermq::workers()`.

### callr_function
A function from `callr` to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.

### callr_arguments
A list of arguments to `callr_function`.

### envir
An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

### script
Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.
**store**

Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

**Details**

To use with a cluster, you will need to set the global options clustermq.scheduler and clustermq.template inside the target script file (default: _targets.R). To read more about configuring clustermq for your scheduler, visit https://mschubert.github.io/clustermq/articles/userguide.html#configuration # nolint and navigate to the appropriate link under "Setting up the scheduler". Wildcards in the template file are filled in with elements from tar_option_get("resources")

**Value**

NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

**See Also**

Other pipeline: tar_make_future(), tar_make()

**Examples**

```r
if (!identical(tolower(Sys.info()["sysname"])), "windows") {
  if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
    tar_dir({ # tar_dir() runs code from a temporary directory.
      tar_script({
        options(clustermq.scheduler = "multicore") # Does not work on Windows.
        tar_option_set()
        list(tar_target(x, 1 + 1))
      }, ask = FALSE)
      tar_make_clustermq()
    })
  } else {
  }
}
```

---

**tar_make_future**

Run a pipeline of targets in parallel with transient future workers.

**Description**

This function is like tar_make() except that targets run in parallel with transient future workers. It requires that you declare your future::plan() inside the target script file (default: _targets.R). future is not a strict dependency of targets, so you must install future yourself.
Usage

```r
tar_make_future(
    names = NULL,
    shortcut = targets::.tar_config_get("shortcut"),
    reporter = targets::.tar_config_get("reporter_make"),
    workers = targets::.tar_config_get("workers"),
    `callr_function` = `callr::r`,
    `callr_arguments` = targets::.callr_args_default(`callr_function`, reporter),
    envir = parent.frame(),
    `script` = targets::.tar_config_get("script"),
    `store` = targets::.tar_config_get("store")
)
```

Arguments

- **names**: Names of the targets to build or check. Set to NULL to check/build all the targets (default). Otherwise, you can supply symbols, a character vector, or tidyselect helpers like `all_of()` and `starts_with()`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) by not individual dynamic branches.

- **shortcut**: Logical of length 1, how to interpret the `names` argument. If `shortcut` is FALSE (default) then the function checks all targets upstream of `names` as far back as the dependency graph goes. `shortcut = TRUE` increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. `shortcut = TRUE` only works if you set `names`.

- **reporter**: Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to `tar_config_get("reporter_make")`. Choices:
  - "verbose": print one message for each target that runs (default).
  - "silent": print nothing.
  - "timestamp": print a time-stamped message for each target that runs.
  - "summary": print a running total of the number of each targets in each status category (queued, started, skipped, build, canceled, or errored). Also show a timestamp ("%H:%M %S" strftime() format) of the last time the progress changed and printed to the screen.

- **workers**: Positive integer, maximum number of transient future workers allowed to run at any given time.

- **callr_function**: A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be NULL for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be NULL for serious reproducible work.

- **callr_arguments**: A list of arguments to `callr_function`. 
envir  An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get(“envir”) in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script  Character of length 1, path to the target script file. Defaults to tar_config_get(“script”), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get(“script”) is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store  Character of length 1, path to the targets data store. Defaults to tar_config_get(“store”), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get(“store”) is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

To configure tar_make_future() with a computing cluster, see the future.batchtools package documentation.

Value

NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

See Also

Other pipeline: tar_make_clustermq(), tar_make()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      future::plan(future::multisession, workers = 2)
      list(
        tar_target(x, 1 + 1),
        tar_target(y, 1 + 1)
      )
    }, ask = FALSE)
    tar_make_future()
  })
}
Produce a data frame of information about your targets.

Description

Along with `tar_visnetwork()` and `tar_glimpse()`, `tar_manifest()` helps check that you constructed your pipeline correctly.

Usage

```r
# Usage Example

# tar_manifest

tar_manifest(
  names = NULL,
  fields = c("name", "command", "pattern"),
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script")
)
```

Arguments

- **names**: Names of the targets to show. Set to `NULL` to show all the targets (default). Otherwise, you can supply symbols, a character vector, or `tidyselect` helpers like `all_of()` and `starts_with()`.

- **fields**: Names of the fields, or columns, to show. Set to `NULL` to show all the fields (default). Otherwise, you can supply symbols, a character vector, or `tidyselect` helpers like `starts_with()`. Set to `NULL` to print all the fields. The name of the target is always included as the first column regardless of the selection. Possible fields are below. All of them can be set in `tar_target()`, `tar_target_raw()`, or `tar_option_set()`.
  - `name`: Name of the target.
  - `command`: the R command that runs when the target builds.
  - `pattern`: branching pattern of the target, if applicable.
  - `format`: Storage format.
  - `iteration`: Iteration mode for branching.
  - `error`: Error mode, what to do when the target fails.
  - `memory`: Memory mode, when to keep targets in memory.
  - `storage`: Storage mode for high-performance computing scenarios.
  - `retrieval`: Retrieval mode for high-performance computing scenarios.
  - `deployment`: Where/whether to deploy the target in high-performance computing scenarios.
  - `priority`: Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).
tar_manifest

• resources: A list of target-specific resource requirements for tar_make_future().
• cue_mode: Cue mode from tar_cue().
• cue_depend: Depend cue from tar_cue().
• cue_expr: Command cue from tar_cue().
• cue_file: File cue from tar_cue().
• cue_format: Format cue from tar_cue().
• cue_iteration: Iteration cue from tar_cue().
• packages: List columns of packages loaded before building the target.
• library: List column of library paths to load the packages.

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

envir
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

Value

A data frame of information about the targets in the pipeline. Rows appear in topological order (the order they will run without any influence from parallel computing or priorities).

---

tar_meta  

*Read a project’s metadata.*

Description

Read the metadata of all recorded targets and global objects.

Usage

```r
tar_meta(
  names = NULL,
  fields = NULL,
  targets_only = FALSE,
  complete_only = FALSE,
  store = targets::tar_config_get("store")
)
```

Arguments

- `names` Optional, names of the targets. If supplied, `tar_meta()` only returns metadata on these targets. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. If NULL, all names are selected.
- `fields` Optional, names of columns/fields to select. If supplied, `tar_meta()` only returns the selected metadata columns. If NULL, all fields are selected. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. The `name` column is always included first no matter what you select. Choices:
  - `name`: name of the target or global object.
• **type**: type of the object: either "function" or "object" for global objects, and "stem", "branch", "map", or "cross" for targets.
• **data**: hash of the output data.
• **command**: hash of the target’s deparsed command.
• **depend**: hash of the immediate upstream dependencies of the target.
• **seed**: random number generator seed with which the target was built. A target’s random number generator seed is a deterministic function of its name. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target,seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.
• **path**: A list column of paths to target data. Usually, each element is a single path, but there could be multiple paths per target for dynamic files (i.e. `tar_target(format = "file")`).
• **time**: POSIXct object with the time the target's data in storage was last modified. If the target stores no local file, then the time stamp corresponds to the time the target last ran successfully. Only targets that run commands have time stamps: just non-branching targets and individual dynamic branches. Displayed in the current time zone of the system. If there are multiple outputs for that target, as with file targets, then the maximum time is shown.
• **size**: hash of the sum of all the bytes of the files at path.
• **bytes**: total file size in bytes of all files in path.
• **format**: character, one of the admissible data storage formats. See the `format` argument in the `tar_target()` help file for details.
• **iteration**: character, either "list" or "vector" to describe the iteration and aggregation mode of the target. See the `iteration` argument in the `tar_target()` help file for details.
• **parent**: for branches, name of the parent pattern.
• **children**: list column, names of the children of targets that have them. These include buds of stems and branches of patterns.
• **seconds**: number of seconds it took to run the target.
• **warnings**: character string of warning messages from the last run of the target.
• **error**: character string of the error message if the target errored.

**targets_only** Logical, whether to just show information about targets or also return metadata on functions and other global objects.

**complete_only** Logical, whether to return only complete rows (no NA values).

**store** Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store pathpersistently for a project.
Details

A metadata row only updates when the target is built. `tar_progress()` shows information on targets that are running. That is why the number of branches may disagree between `tar_meta()` and `tar_progress()` for actively running pipelines.

Value

A data frame with one row per target/object and the selected fields.

See Also

Other data: `tar_load_raw()`, `tar_load()`, `tar_objects()`, `tar_pid()`, `tar_process()`, `tar_read_raw()`, `tar_read()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      ),
      ask = FALSE
    } n = FALSE)
    tar_make()
    tar_meta()
    tar_meta(starts_with("y_")) # see also all_of()
  })
}
```

---

tar_name

Get the name of the target currently running.

Description

Get the name of the target currently running.

Usage

```r
tar_name(default = "target")
```

Arguments

- `default` Character, value to return if `tar_name()` is called on its own outside a targets pipeline. Having a default lets users run things without `tar_make()`, which helps peel back layers of code and troubleshoot bugs.
**tar_network**

**Value**

Character of length 1. If called inside a pipeline, `tar_name()` returns name of the target currently running. Otherwise, the return value is default.

**See Also**

Other utilities: `tar_cancel()`, `tar_envir()`, `tar_group()`, `tar_path()`, `tar_seed()

**Examples**

```r
tar_name()
tar_name(default = "custom_target_name")
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir()
  tar_script(tar_target(x, tar_name()), ask = FALSE)
  tar_make()
  tar_read(x)
}
```

---

**tar_network**

*Return the vertices and edges of a pipeline dependency graph.*

**Description**

Analyze the pipeline defined in the target script file (default: `_targets.R`) and return the vertices and edges of the directed acyclic graph of dependency relationships.

**Usage**

```r
tar_network(
  targets_only = FALSE,
  names = NULL,
  shortcut = FALSE,
  allow = NULL,
  exclude = NULL,
  outdated = TRUE,
  reporter = targets::tar_config_get("reporter_outdated"),
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```
Arguments

targets_only Logical, whether to restrict the output to just targets (FALSE) or to also include imported global functions and objects.

names Names of targets. The graph visualization will operate only on these targets (and unless shortcut is TRUE, all the targets upstream as well). Selecting a small subgraph using names could speed up the load time of the visualization. Unlike allow, names is invoked before the graph is generated. Set to NULL to check/build all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

shortcut Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

allow Optional, define the set of allowable vertices in the graph. Unlike names, allow is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with().

exclude Optional, define the set of exclude vertices from the graph. Unlike names, exclude is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like all_of() and starts_with().

outdated Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and build progress.

reporter Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:
- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

callr_function A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments A list of arguments to callr_function.

envir An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function
should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

**script**

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to _targets_. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to _targets_/ . When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

A list with two data frames: vertices and edges. The vertices data frame has one row per target with fields to denote the type of the target or object (stem, branch, map, cross, function, or object) and the target's status (up to date, outdated, started, canceled, or errored). The edges data frame has one row for every edge and columns `to` and `from` to mark the starting and terminating vertices.

**See Also**

Other inspect: `tar_deps_raw()`, `tar_deps()`, `tar_glimpse()`, `tar_manifest()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()` , `tar_visnetwork()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      tar_option_set()
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      )
    }, ask = FALSE)
  tar_network(targets_only = TRUE)
}
}
```
**tar_newer**

*List new targets*

**Description**

List all the targets whose last successful run occurred after a certain point in time.

**Usage**

```r
tar_newer(
  time,
  names = NULL,
  inclusive = FALSE,
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **time**: A POSIXct object of length 1, time threshold. Targets newer than this time stamp are returned. For example, if `time = Sys.time() - as.difftime(1, units = "weeks")` then `tar_newer()` returns targets newer than one week ago.
- **names**: Names of eligible targets. Targets excluded from `names` will not be returned even if they are newer than the given time. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. If NULL, all names are eligible.
- **inclusive**: Logical of length 1, whether to include targets built at exactly the time given.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

Only applies to targets with recorded time stamps: just non-branching targets and individual dynamic branches. As of targets version 0.6.0, these time stamps are available for these targets regardless of storage format. Earlier versions of targets do not record time stamps for remote storage formats such as "url" or any of the "aws_*" formats.

**Value**

A character vector of names of old targets with recorded timestamp metadata.

**See Also**

Other time: `tar_older()`, `tar_timestamp_raw()`, `tar_timestamp()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(tar_target(x, seq_len(2)))
    }, ask = FALSE)
    tar_make()
    # targets newer than 1 week ago
    tar_newer(Sys.time() - as.difftime(1, units = "weeks"))
    # targets newer than 1 week from now
    tar_newer(Sys.time() + as.difftime(1, units = "weeks"))
    # Everything is still up to date.
    tar_make()
    # Invalidate all targets targets newer than 1 week ago
    # so they run on the next tar_make().
    invalidate_these <- tar_newer(Sys.time() - as.difftime(1, units = "weeks"))
    tar_invalidate(all_of(invalidate_these))
    tar_make()
  })
}
```

---

tar_objects

**List saved targets**

**Description**

List targets currently saved to _targets/objects_. Does not include dynamic files or cloud storage.

**Usage**

```
tar_objects(names = NULL, store = targets::tar_config_get("store"))
```

**Arguments**

- **names**
  - Optional tidyselect selector such as `all_of()` or `starts_with()` to return a tactical subset of target names. If `NULL`, all names are selected.

- **store**
  - Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

Character vector of targets saved to _targets/objects_.

See Also

Other data: `tar_load_raw()`, `tar_load()`, `tar_meta()`, `tar_pid()`, `tar_process()`, `tar_read_raw()`, `tar_read()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(tar_target(x, "value"))
    }, ask = FALSE)
    tar_make()
    tar_objects()
    tar_objects(starts_with("x")) # see also all_of()
  })
}
```

```

### `tar_older`

**List old targets**

List all the targets whose last successful run occurred before a certain point in time. Combine with `tar_invalidate()`, you can use `tar_older()` to automatically rerun targets at regular intervals. See the examples for a demonstration.

**Usage**

```r
tax_older(
  time,
  names = NULL,
  inclusive = FALSE,
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **time**: A POSIXct object of length 1, time threshold. Targets older than this time stamp are returned. For example, if `time = Sys.time() - as.difftime(1, units = "weeks")` then `tar_older()` returns targets older than one week ago.
- **names**: Names of eligible targets. Targets excluded from names will not be returned even if they are old. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. If NULL, all names are eligible.
- **inclusive**: Logical of length 1, whether to include targets built at exactly the time given.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.
Details

Only applies to targets with recorded time stamps: just non-branching targets and individual dynamic branches. As of targets version 0.6.0, these time stamps are available for these targets regardless of storage format. Earlier versions of targets do not record time stamps for remote storage formats such as "url" or any of the "aws_*" formats.

Value

A character vector of names of old targets with recorded timestamp metadata.

See Also

Other time: tar_newer(), tar_timestamp_raw(), tar_timestamp()

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(tar_target(x, seq_len(2)))
    }, ask = FALSE)
    tar_make()
    # targets older than 1 week ago
    tar_older(Sys.time() - as.difftime(1, units = "weeks"))
    # targets older than 1 week from now
    tar_older(Sys.time() + as.difftime(1, units = "weeks"))
    # Everything is still up to date.
    tar_make()
    # Invalidate all targets targets older than 1 week from now
    # so they run on the next tar_make().
    invalidate_these <- tar_older(Sys.time() + as.difftime(1, units = "weeks"))
    tar_invalidate(all_of(invalidate_these))
    tar_make()
  })
}
```
Arguments

name          Character of length 1, name of an option to get. Must be one of the argument names of `tar_option_set()`.

option       Deprecated, use the name argument instead.

Details

This function goes well with `tar_target_raw()` when it comes to defining external interfaces on top of the `targets` package to create pipelines.

Value

Value of a target option.

See Also

Other configuration: `tar_config_get()`, `tar_config_set()`, `tar_envvars()`, `tar_option_reset()`, `tar_option_set()`

Examples

```r
tar_option_get("format") # default format before we set anything
tar_target(x, 1)$settings$format
tar_option_set(format = "fst_tbl") # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format
tar_option_reset() # reset the format
tar_target(x, 1)$settings$format
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir({ # tar_dir() runs code from a temporary directory.
tar_script({
  tar_option_set(cue = tar_cue(mode = "always")) # All targets always run.
  list(tar_target(x, 1), tar_target(y, 2))
})
tar_make()
tar_make()
})
}
```

```
tar_option_reset  Reset all target options.
```

Description

Reset all target options you previously chose with `tar_option_set()`. These options are mostly configurable default arguments to `tar_target()` and `tar_target_raw()`.
Usage

tar_option_set()

Value

NULL (invisibly).

See Also

Other configuration: tar_config_get(), tar_config_set(), tar_envvars(), tar_option_get(),
tar_option_set()

Examples

tar_option_get("format") # default format before we set anything
tar_target(x, 1)$settings$format

tar_option_set(format = "fst_tbl") # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format

tar_option_reset() # reset all options
tar_target(x, 1)$settings$format

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir({ # tar_dir() runs code from a temporary directory.
tar_script({
  tar_option_set(cue = tar_cue(mode = "always"))
  tar_option_reset() # Undo option above.
  list(tar_target(x, 1), tar_target(y, 2))
})
tar_make()
tar_make()
})
}

---

tar_option_set Set target options.

Description

Set target options, including default arguments to tar_target() such as packages, storage format,
iteration type, and cue. Only the non-null arguments are actually set as options. See currently set
options with tar_option_get(). To use tar_option_set() effectively, put it in your workflow’s
target script file (default: _targets.R) before calls to tar_target() or tar_target_raw().

Usage

tar_option_set(
  tidy_eval = NULL,
  packages = NULL,
imports = NULL,
library = NULL,
envir = NULL,
format = NULL,
iteration = NULL,
error = NULL,
memory = NULL,
garbage_collection = NULL,
deployment = NULL,
priority = NULL,
backoff = NULL,
resources = NULL,
storage = NULL,
retrieval = NULL,
cue = NULL,
debug = NULL,
workspaces = NULL,
workspace_on_error = NULL
)

Arguments

- **tidy_eval** Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

- **packages** Character vector of packages to load right before the target builds. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

- **imports** Character vector of package names to track global dependencies. For example, if you write `tar_option_set(imports = "yourAnalysisPackage")` early in your target script file (default: _targets.R) then `tar_make()` will automatically rerun or skip targets in response to changes to the R functions and objects defined in yourAnalysisPackage. Does not account for low-level compiled code such as C/C++ or Fortran. If you supply multiple packages, e.g. `tar_option_set(imports = c("p1","p2"))`, then the objects in p1 override the objects in p2 if there are name conflicts. Similarly, objects in `tar_option_get("envir")` override everything in `tar_option_get("imports")`.

- **library** Character vector of library paths to try when loading packages.

- **envir** Environment containing functions and global objects common to all targets in the pipeline. The envir argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then envir2 will be used.

If envir is the global environment, all the promise objects are diffused before sending the data to parallel workers in `tar_make_future()` and `tar_make_clustermq()`,
but otherwise the environment is unmodified. This behavior improves performance by decreasing the size of data sent to workers.

If `envir` is not the global environment, then it should at least inherit from the global environment or base environment so `targets` can access attached packages. In the case of a non-global `envir`, `targets` attempts to remove potentially high memory objects that come directly from `targets`. That includes `tar_target()` objects of class "tar_target", as well as objects of class "tar_pipeline" or "tar_algorithm". This behavior improves performance by decreasing the size of data sent to workers.

Package environments should not be assigned to `envir`. To include package objects as upstream dependencies in the pipeline, assign the package to the packages and imports arguments of `tar_option_set()`.

**format**

Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

**iteration**

Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[[]] and aggregation happens with list().
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with dplyr::group_by().

**error**

Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)

**memory**

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files such as `format = "aws_file"`, this memory strategy applies to temporary local copies of the file in _targets/scratch/: "persistent" means they remain until the end of the pipeline, and "transient" means they get deleted from the file system as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection**

Logical, whether to run `base::gc()` just before the target runs.
**deployment** Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

**priority** Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

**backoff** Numeric of length 1, must be greater than or equal to 0.01. Maximum upper bound of the random polling interval for the priority queue (seconds). In high-performance computing (e.g. `tar_make_clustermq()` and `tar_make_future()`), it can be expensive to repeatedly poll the priority queue if no targets are ready to process. The number of seconds between polls is `runif(1, 0.001, max(backoff, 0.001 * 1.5 ^ index))`, where index is the number of consecutive polls so far that found no targets ready to skip or run. (If no target is ready, index goes up by 1. If a target is ready, index resets to 0. For more information on exponential backoff, visit [https://en.wikipedia.org/wiki/Exponential_backoff](https://en.wikipedia.org/wiki/Exponential_backoff)). Raising backoff is kinder to the CPU etc. but may incur delays in some instances.

**resources** Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

**storage** Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "main", the target's return value is sent back to the host machine and saved locally. If "worker", the worker saves the value.

**retrieval** Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "main", the target's dependencies are loaded on the host machine and sent to the worker before the target builds. If "worker", the worker loads the targets dependencies.

**cue** An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**debug** Character vector of names of targets to run in debug mode. To use effectively, you must set `callr_function = NULL` and restart your R session just before running. You should also `tar_make()`, `tar_make_clustermq()`, or `tar_make_future()`. For any target mentioned in debug, targets will force the target to build locally (with `tar_cue(mode = "always")` and `deployment = "main"` in the settings) and pause in an interactive debugger to help you diagnose problems. This is like inserting a `browser()` statement at the beginning of the target's expression, but without invalidating any targets.

**workspaces** Character vector of target names. Could be non-branching targets, whole dynamic branching targets, or individual branch names. `tar_make()` and friends will save workspace files for these targets even if the targets are skipped. Workspace files help with debugging. See `tar_workspace()` for details about workspaces.

**workspace_on_error** Logical of length 1, whether to save a workspace file for each target that throws an error. Workspace files help with debugging. See `tar_workspace()` for details about workspaces.
Value

NULL (invisibly).

See Also

Other configuration: `tar_config_get()`, `tar_config_set()`, `tar_envvars()`, `tar_option_get()`, `tar_option_reset()`

Examples

tar_option_get("format")  # default format before we set anything
tar_target(x, 1)$settings$format
tar_option_set(format = "fst_tbl")  # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format
tar_option_reset()  # reset the format
tar_target(x, 1)$settings$format

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir({  # tar_dir() runs code from a temporary directory.
tar_script({
  tar_option_set(cue = tar_cue(mode = "always"))  # All targets always run.
  list(tar_target(x, 1), tar_target(y, 2))
})
tar_make()
tar_make()
})

Description

Checks for outdated targets in the pipeline, targets that will be rerun automatically if you call `tar_make()` or similar. See `tar_cue()` for the rules that decide whether a target needs to rerun.

Usage

tar_outdated(
  names = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  branches = FALSE,
  targets_only = TRUE,
  reporter = targets::tar_config_get("reporter_outdated"),
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
Arguments

names
Names of the targets. `tar_outdated()` will check these targets and all upstream ancestors in the dependency graph. Set names to NULL to check/build all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) by not individual dynamic branches.

shortcut
Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

branches
Logical of length 1, whether to include branch names. Including branches could get cumbersome for large pipelines. Individual branch names are still omitted when branch-specific information is not reliable: for example, when a pattern branches over an outdated target.

targets_only
Logical of length 1, whether to just restrict to targets or to include functions and other global objects from the environment created by running the target script file (default: _targets.R).

reporter
Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:

- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

envir
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then envir2 will be used.
**tar_path**

`Identify the file path where a target will be stored.`

**Description**

Identify the file path where a target will be stored after the target finishes running in the pipeline.

**script**

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

Requires that you define a pipeline with a target script file (default: `_targets.R`). (See `tar_script()` for details.)

**Value**

Names of the outdated targets.

**See Also**

Other inspect: `tar_deps_raw()`, `tar_deps()`, `tar_glimpse()`, `tar_manifest()`, `tar_network()`, `tar_sitrep()`, `tar_validate()`, `tar_visnetwork()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir(# tar_dir() runs code from a temporary directory.
  tar_script(list(tar_target(x, 1 + 1)))
  tar_outdated()
  tar_script({
    list(
      tar_target(y1, 1 + 1),
      tar_target(y2, 1 + 1),
      tar_target(z, y1 + y2)
    ), ask = FALSE)
  tar_outdated()
}
```
Usage

tar_path(
    name = NULL,
    default = NA_character_,
    store = targets::tar_config_get("store")
)

Arguments

name Symbol, name of a target. If NULL, tar_path() returns the path of the target currently running in a pipeline.
default Character, value to return if tar_path() is called on its own outside a targets pipeline. Having a default lets users run things without tar_make(), which helps peel back layers of code and troubleshoot bugs.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

tar_path(name = your_target) just returns _targets/objects/your_target, the file path where your_target will be saved unless format is equal to "file" or any of the supported cloud-based storage formats.
If you call tar_path() with no arguments while target x is running, the name argument defaults to the name of the target, so tar_path() returns _targets/objects/x.

Value

Character, file path to a hypothetical target.

See Also

Other utilities: tar_cancel, tar_envir, tar_group, tar_name, tar_seed

Examples

tar_path()
tar_path(your_target)
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(tar_target(returns_path, tar_path()), ask = FALSE)
    tar_make()
    tar_read(returns_path)
  })
}
**Description**

Emulate the dynamic branching process outside a pipeline. `tar_pattern()` can help you understand the overall branching structure that comes from the `pattern` argument of `tar_target()`.

**Usage**

```r
tar_pattern(pattern, ..., seed = 0L)
```

**Arguments**

- `pattern`: Function call with the pattern specification.
- `...`: Named integers, each of length 1. Each name is the name of a dependency target, and each integer is the length of the target (number of branches or slices). Names must be unique.
- `seed`: Integer of length 1, random number generator seed to emulate the pattern reproducibly. (The `sample()` pattern is random). In a real pipeline, the seed is automatically generated from the target name in deterministic fashion.

**Details**

Dynamic branching is a way to programmatically create multiple new targets based on the values of other targets, all while the pipeline is running. Use the `pattern` argument of `tar_target()` to get started. `pattern` accepts a function call composed of target names and any of the following patterns:

- `map()`: iterate over one or more targets in sequence.
- `cross()`: iterate over combinations of slices of targets.
- `slice()`: select one or more slices by index, e.g. `slice(x, index = c(3,4))` selects the third and fourth slice or branch of `x`.
- `head()`: restrict branching to the first few elements.
- `tail()`: restrict branching to the last few elements.
- `sample()`: restrict branching to a random subset of elements.

**Value**

A tibble showing the kinds of dynamic branches that `tar_target()` would create in a real pipeline with the given pattern. Each row is a dynamic branch, each column is a dependency target, and each element is the name of an upstream bud or branch that the downstream branch depends on. Buds are pieces of non-branching targets (‘stems’) and branches are pieces of patterns. The returned bud and branch names are not the actual ones you will see when you run the pipeline, but they do communicate the branching structure of the pattern.
See Also

Other branching: `tar_branch_index()`, `tar_branch_names_raw()`, `tar_branch_names()`, `tar_branches()`

Examples

```r
# To use dynamic map for real in a pipeline,
# call map() in a target's pattern.
# The following code goes at the bottom of
# your target script file (default: `\_targets.R`).
list(
  tar_target(x, seq_len(2)),
  tar_target(y, head(letters, 2)),
  tar_target(dynamic, c(x, y), pattern = map(x, y)) # 2 branches
)
# Likewise for more complicated patterns.
list(
  tar_target(x, seq_len(2)),
  tar_target(y, head(letters, 2)),
  tar_target(z, head(LETTERS, 2)),
  tar_target(dynamic, c(x, y, z), pattern = cross(z, map(x, y))) # 4 branches
)
# But you can emulate dynamic branching without running a pipeline
# in order to understand the patterns you are creating. Simply supply
# the pattern and the length of each dependency target.
# The returned data frame represents the branching structure of the pattern:
# One row per new branch, one column per dependency target, and
# one element per bud/branch in each dependency target.

tar_pattern(
  cross(x, map(y, z)),
  x = 2,
  y = 3,
  z = 3
)
tar_pattern(
  head(cross(x, map(y, z)), n = 2),
  x = 2,
  y = 3,
  z = 3
)
```

---

**tar_pid**  
*Get main process ID.*

**Description**

Get the process ID (PID) of the most recent main R process to orchestrate the targets of the current project.
Usage

tar_pid(store = targets::tar_config_get("store"))

Arguments

store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

The main process is the R process invoked by tar_make() or similar. If callr_function is not NULL, this is an external process, and the pid in the return value will not agree with Sys.getpid() in your current interactive session. The process may or may not be alive. You may want to check it with ps::ps_is_running(ps::ps_handle(targets::tar_pid())) before running another call to tar_make() for the same project.

Value

Integer with the process ID (PID) of the most recent main R process to orchestrate the targets of the current project.

See Also

Other data: tar_load_raw(), tar_load(), tar_meta(), tar_objects(), tar_process(), tar_read_raw(), tar_read()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      )
    }, ask = FALSE)
    tar_make()
    Sys.getpid()
    tar_pid() # Different from the current PID.
  })
}
Repeately poll progress in the R console.

Description

Print the information in tar_progress_summary() at regular intervals.

Usage

tar_poll(
  interval = 1,
  timeout = Inf,
  fields = c("skipped", "started", "built", "errored", "canceled", "since"),
  store = targets::tar_config_get("store")
)

Arguments

interval Number of seconds to wait between iterations of polling progress.
timeout How many seconds to run before exiting.
fields Optional, names of progress data columns to read. Set to NULL to read all fields.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store").

See Also

Other progress: tar_progress_branches(), tar_progress_summary(), tar_progress(), tar_watch_server(), tar_watch_ui(), tar_watch()

Examples

if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(100)),
        tar_target(y, Sys.sleep(0.1), pattern = map(x))
      ),
    ask = FALSE)
    px <- tar_make(callr_function = callr::r_bg, reporter = "silent")
    tar_poll()
  })
}
Description

Get info on the most recent main R process to orchestrate the targets of the current project.

Usage

tar_process(names = NULL, store = targets::tar_config_get("store"))

Arguments

- **names**: Optional, names of the data points to return. If supplied, `tar_process()` returns only the rows of the names you select. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. If NULL, all names are selected.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

The main process is the R process invoked by `tar_make()` or similar. If `callr_function` is not NULL, this is an external process, and the pid in the return value will not agree with `Sys.getpid()` in your current interactive session. The process may or may not be alive. You may want to check the status with `tar_pid() %in% ps::ps_pids()` before running another call to `tar_make()` for the same project.

Value

A data frame with metadata on the most recent main R process to orchestrate the targets of the current project. The output includes the `pid` of the main process.

See Also

Other data: `tar_load_raw()`, `tar_load()`, `tar_meta()`, `tar_objects()`, `tar_pid()`, `tar_read_raw()`, `tar_read()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
    }
  })
```
tar_progress

Description

Read a project’s target progress data for the most recent run of `tar_make()` or similar. Only the most recent record is shown.

Usage

```r
tar_progress(
  names = NULL,
  fields = "progress",
  store = targets::tar_config_get("store")
)
```

Arguments

- **names**: Optional, names of the targets. If supplied, `tar_progress()` only returns progress information on these targets. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`.
- **fields**: Optional, names of progress data columns to read. Set to `NULL` to read all fields.
- **store**: Character of length 1, path to the `targets` data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A data frame with one row per target and the following columns:

- **name**: name of the target.
- **type**: type of target: "stem" for non-branching targets, "pattern" for dynamically branching targets, and "branch" for dynamic branches.
- **parent**: name of the target’s parent. For branches, this is the name of the associated pattern. For other targets, the pattern is just itself.
- **branches**: number of dynamic branches of a pattern. 0 for non-patterns.
- **progress**: the most recent progress update of that target. Could be "started", "built", "canceled", or "errored".
See Also

Other progress: `tar_poll()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_watch_server()`, `tar_watch_ui()`, `tar_watch()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({  # tar_dir() runs code from a temporary directory.
    tar_script({
      tar_target(x, seq_len(2)),
      tar_target(y, 2 * x, pattern = map(x))
    }), ask = FALSE)
  tar_make()
  tar_progress()
  tar_progress(starts_with("y_"))  # see also all_of()
}
```

Description

Read a project’s target progress data for the most recent run of the pipeline and display the tabulated status of dynamic branches. Only the most recent record is shown.

Usage

```r
tar_progress_branches(
  names = NULL,
  fields = NULL,
  store = targets::tar_config_get("store")
)
```

Arguments

- `names` Optional, names of the targets. If supplied, `tar_progress()` only returns progress information on these targets. You can supply symbols or tidyselect helpers like `starts_with()`.
- `fields` Optional, names of progress data columns to read. Set to `NULL` to read all fields.
- `store` Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.
**Value**

A data frame with one row per target per progress status and the following columns.

- **name**: name of the pattern.
- **progress**: progress status: "started", "built", "cancelled", or "errored".
- **branches**: number of branches in the progress category.
- **total**: total number of branches planned for the whole pattern. Values within the same pattern should all be equal.

**See Also**

Other progress: `tar_poll()`, `tar_progress_summary()`, `tar_progress()`, `tar_watch_server()`, `tar_watch_ui()`, `tar_watch()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({  # tar_dir() runs code from a temporary directory.
    tar_script(
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, x, pattern = map(x)),
        tar_target(z, stopifnot(y < 1.5), pattern = map(y))
      ), ask = FALSE)
    try(tar_make())
    tar_progress_branches()
  })
}
```

---

**tar_progress_summary**  *Summarize target progress.*

**Description**

Summarize the progress of a run of the pipeline.

**Usage**

```r
tar_progress_summary(
  fields = c("skipped", "started", "built", "errored", "canceled", "since"),
  store = targets::tar_config_get("store")
)
```
Arguments

fields  Optional, names of progress data columns to read. Set to NULL to read all fields.
store   Character of length 1, path to the targets data store. Defaults to \(\text{tar\_config\_get("store")}\),
in turn defaults to \_targets/\. When you set this argument, the value of \text{tar\_config\_get("store")}\ is temporarily changed for the current function call. See \text{tar\_config\_get()}\ and \text{tar\_config\_set()}\ for details about how to set the data store path persistently for a project.

Value

A data frame with one row and the following optional columns that can be selected with fields. (time is omitted by default.)

- started: number of targets that started and did not (yet) finish.
- built: number of targets that completed without error or cancellation.
- errored: number of targets that threw an error.
- canceled: number of canceled targets (see \text{tar\_cancel()}\).
- since: how long ago progress last changed (\text{Sys.time()} - time).
- time: the time when the progress last changed (modification timestamp of the \_targets/meta/progress file).

See Also

Other progress: \text{tar\_poll()}, \text{tar\_progress\_branches()}, \text{tar\_progress()}, \text{tar\_watch\_server()}, \text{tar\_watch\_ui()}, \text{tar\_watch()}

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, x, pattern = map(x)),
        tar_target(z, stopifnot(y < 1.5), pattern = map(y), error = "continue")
      )
    }, ask = FALSE)
    try(tar_make())
    tar_progress_summary()
  })
}
```
tar_prune  Remove targets that are no longer part of the pipeline.

Description

Remove target values from _targets/objects/ and target metadata from _targets/meta/meta for targets that are no longer part of the pipeline. Global objects and dynamic files outside the data store are unaffected. Also removes _targets/scratch/, which is only needed while tar_make(), tar_make_clustermq(), or tar_make_future() is running.

Usage

tar_prune(
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)

Arguments

callr_function  A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments  A list of arguments to callr_function.

envir  An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script  Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.
**Description**

Read a target's return value from its file in _targets/objects/. For dynamic files (i.e. `format = "file"`) the paths are returned.

**Usage**

```r
name,
branches = NULL,
meta = tar_meta(store = store),
store = targets::tar_config_get("store")
```

**Value**

NULL except if `callr_function = callr::r_bg()`, in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

**See Also**

Other clean: `tar_delete()`, `tar_destroy()`, `tar_invalidate()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      )
    ), ask = FALSE)
  tar_make()
  # Remove some targets from the pipeline.
  tar_script(list(tar_target(y1, 1 + 1)), ask = FALSE)
  # Keep only the remaining targets in the data store.
  tar_prune()
}
```
Arguments

name Symbol, name of the target to read.
branches Integer of indices of the branches to load if the target is a pattern.
meta Data frame of metadata from tar_meta(). tar_read() with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call tar_meta() beforehand and supply it to the meta argument, then successive calls to tar_read() may run much faster.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

The target’s return value from its file in _targets/objects/, or the paths to the custom files and directories if format = "file" was set.

Limited scope

tar_read() and tar_load() are only for exploratory analysis and literate programming, and tar_read_raw() and tar_load_raw() are only for exploratory analysis. targets automatically loads the correct dependencies into memory when the pipeline is running, so invoking these functions from inside a target is rarely advisable.

See Also

Other data: tar_load_raw(), tar_load(), tar_meta(), tar_objects(), tar_pid(), tar_process(), tar_read_raw()

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
    tar_make()
    tar_read(x)
  })
}
```

Description

Like tar_read() except name is a character string. Do not use in knitr or R Markdown reports with tarchetypes::tar_knit() or tarchetypes::tar_render().
tar_read_raw

Usage

tar_read_raw(
  name,
  branches = NULL,
  meta = tar_meta(store = store),
  store = targets::tar_config_get("store")
)

Arguments

name Character, name of the target to read.
branches Integer of indices of the branches to load if the target is a pattern.
meta Data frame of metadata from tar_meta(). tar_read() with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call tar_meta() beforehand and supply it to the meta argument, then successive calls to tar_read() may run much faster.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

The target’s return value from its file in _targets/objects/, or the paths to the custom files and directories if format = "file" was set.

Limited scope

tar_read() and tar_load() are only for exploratory analysis and literate programming, and tar_read_raw() and tar_load_raw() are only for exploratory analysis. targets automatically loads the correct dependencies into memory when the pipeline is running, so invoking these functions from inside a target is rarely advisable.

See Also

Other data: tar_load_raw(), tar_load(), tar_meta(), tar_objects(), tar_pid(), tar_process(), tar_read()

Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
    tar_make()
    tar_read_raw("x")
  })
}
}
**tar_renv**

*Set up package dependencies for compatibility with renv*

**Description**

Write package dependencies to a script file (by default, named `_targets_packages.R` in the root project directory). Each package is written to a separate line as a standard `library()` call (e.g. `library(package)`) so renv can identify them automatically.

**Usage**

```r
tar_renv(
  extras = c("bs4Dash", "clustermq", "future", "gt", "markdown", "pingr", "rstudioapi", "shiny", "shinybusy", "shinyWidgets", "visNetwork"),
  path = "_targets_packages.R",
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script")
)
```

**Arguments**

- **extras**
  
  Character vector of additional packages to declare as project dependencies.

- **path**
  
  Character of length 1, path to the script file to populate with `library()` calls.

- **callr_function**
  
  A function from `callr` to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.

- **callr_arguments**
  
  A list of arguments to `callr_function`.

- **envir**
  
  An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

  The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.
**script**  
Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**Details**

This function gets called for its side-effect, which writes package dependencies to a script for compatibility with `renv`. The generated file should not be edited by hand and will be overwritten each time `tar_renv()` is called.

The behavior of `renv` is to create and manage a project-local R library and keep a record of project dependencies in a file called `renv.lock`. To identify dependencies, `renv` crawls through code to find packages explicitly mentioned using `library()`, `require()`, or `::`. However, `targets` manages packages in a way that hides dependencies from `renv`. `tar_renv()` finds package dependencies that would be otherwise hidden to `renv` because they are declared using the `targets` API. Thus, calling `tar_renv()` this is only necessary if using `tar_option_set()` or `tar_target()` to use specialized storage formats or manage packages.

With the script written by `tar_renv()`, `renv` is able to crawl the file to identify package dependencies (with `renv::dependencies()`). `tar_renv()` only serves to make your `targets` project compatible with `renv`, it is still the users responsibility to call `renv::init()` and `renv::snapshot()` directly to initialize and manage a project-local R library. This allows your `targets` pipeline to have its own self-contained R library separate from your standard R library. See [https://rstudio.github.io/renv/index.html](https://rstudio.github.io/renv/index.html) for more information.

**Value**

Nothing, invisibly.

**See Also**

[https://rstudio.github.io/renv/articles/renv.html](https://rstudio.github.io/renv/articles/renv.html)

Other scripts: `tar_edit()`, `tar_github_actions()`, `tar_helper_raw()`, `tar_helper()`, `tar_script()`

**Examples**

```r
tar_dir({  # tar_dir() runs code from a temporary directory.
  tar_script({
    tar_option_set(packages = c("tibble", "qs"))
    list()
  }, ask = FALSE)
  tar_renv()
  writeLines(readLines("_targets_packages.R"))
})
tar_option_reset()
```
Create a resources argument for `tar_target()` or `tar_option_set()`.

**Usage**

```r
tar_resources(
  aws = NULL,
  clustermq = NULL,
  feather = NULL,
  fst = NULL,
  future = NULL,
  parquet = NULL,
  qs = NULL,
  url = NULL
)
```

**Arguments**

- `aws`: Output of function `tar_resources_aws()`. AWS S3 storage settings for AWS backed storage formats such as "aws_qs" and "aws_parquet. Applies to all formats beginning with the "aws_" prefix. For details on formats, see the format argument of `tar_target()`.

- `clustermq`: Output of function `tar_resources_clustermq()`. Optional clustermq settings for `tar_make_clustermq()`, including the log_worker and template arguments of clustermq::workers().

- `feather`: Output of function `tar_resources_feather()`. Non-default arguments to `arrow::read_feather()` and `arrow::write_feather()` for arrow/feather-based storage formats. Applies to all formats ending with the ",feather" suffix. For details on formats, see the format argument of `tar_target()`.

- `fst`: Output of function `tar_resources_fst()`. Non-default arguments to `fst::read_fst()` and `fst::write_fst()` for fst-based storage formats. Applies to all formats ending with "fst" in the name. For details on formats, see the format argument of `tar_target()`.

- `future`: Output of function `tar_resources_future()`. Optional future settings for `tar_make_future()`, including the resources argument of `future::future()`, which can include values to insert in template placeholders in `future.batchtools` template files. This is how to supply the resources argument of `future::future()` for targets. Resources supplied through `future::plan()` and `future::tweak()` are completely ignored.

- `parquet`: Output of function `tar_resources_parquet()`. Non-default arguments to `arrow::read_parquet()` and `arrow::write_parquet()` for arrow/parquet-based storage formats. Applies to all formats ending with the "parquet" suffix. For details on formats, see the format argument of `tar_target()`.
### qs

Output of function `tar_resources_qs()`. Non-default arguments to `qs::qread()` and `qs::qsave()` for qs-based storage formats. Applies to all formats ending with the "_.qs" suffix. For details on formats, see the format argument of `tar_target()`.

### url

Output of function `tar_resources_url()`. Non-default settings for storage formats ending with the "_.url" suffix. These settings include the curl handle for extra control over HTTP requests. For details on formats, see the format argument of `tar_target()`.

### Value

A list of objects of class "tar_resources" with non-default settings of various optional backends for data storage and high-performance computing.

### Resources

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resource()` function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with `tar_target()`, all the resources from `tar_option_get("resources")` are dropped for that target. In other words, if you write `tar_option_set(resources = resources_1)` and then `tar_target(x,my_command(),resources = resources_2)`, then everything in `resources_1` is discarded for target `x`.

### See Also

Other resources: `tar_resources_aws()`, `tar_resources_clustermq()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`

### Examples

```r
# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "qs",
  resources = tar_resources(
    qs = tar_resources_qs(preset = "fast"),
    future = tar_resources_future(resources = list(n_cores = 1))
  )
)
```
Description

Create the aws argument of `tar_resources()` to specify optional settings to AWS storage formats. See the format argument of `tar_target()` for details.

Usage

```r
tar_resources_aws(bucket, prefix = targets::path_objects_dir_cloud())
```

Arguments

- `bucket` Character of length 1, name of an existing AWS S3 bucket to upload and download the return values of the affected targets during the pipeline.
- `prefix` Character of length 1, "directory path" in the S3 bucket where the target return values are stored.

Value

Object of class "tar_resources_aws", to be supplied to the aws argument of `tar_resources()`.

Resources

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with `tar_target()`, all the resources from `tar_option_get("resources")` are dropped for that target. In other words, if you write `tar_option_set(resources = resources_1)` and then `tar_target(x, my_command(), resources = resources_2)`, then everything in `resources_1` is discarded for target `x`.

See Also

Other resources: `tar_resources_clusterq()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`, `tar_resources()`

Examples

```r
# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "aws_qs",
  resources = tar_resources(
    aws = tar_resources_aws(bucket = "yourbucketname"),
  ))
```

qs = tar_resources_qs(preset = "fast")
)
)

tar_resources_clustermq

Target resources: clustermq high-performance computing

Description

Create the clustermq argument of tar_resources() to specify optional high-performance computing settings for tar_make_clustermq(). For details, see the documentation of the clustermq R package and the corresponding argument names in this help file.

Usage

tar_resources_clustermq(template = list())

Arguments

template Named list, template argument to clustermq::workers().

Value

Object of class "tar_resources_clustermq", to be supplied to the clustermq argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x,my_command(),resources = resources_2), then everything in resources_1 is discarded for target x.

See Also

Other resources: tar_resources_aws(), tar_resources_feather(), tar_resources_fst(), tar_resources_future(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url(), tar_resources()
Examples

# Somewhere in you target script file (usually _targets.R):

tar_target(
  name,
  command(),
  resources = tar_resources(
    clustermq = tar_resources_clustermq(template = list(n_cores = 2))
  )
)

tar_resources_feather  Target resources: feather storage formats

Description

Create the feather argument of tar_resources() to specify optional settings for feather data frame storage formats powered by the arrow R package. See the format argument of tar_target() for details.

Usage

tar_resources_feather(compression = "default", compression_level = NULL)

Arguments

- compression: Character of length 1, compression argument of arrow::write_feather().
- compression_level: Numeric of length 1, compression_level argument of arrow::write_feather().

Value

Object of class "tar_resources_feather", to be supplied to the feather argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x, my_command(), resources = resources_2), then everything in resources_1 is discarded for target x.

See Also

Other resources: tar_resources_aws(), tar_resources_clustermq(), tar_resources_fst(), tar_resources_future(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url(), tar_resources()
Examples

# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "feather",
  resources = tar_resources(
    feather = tar_resources_feather(compression = "lz4")
  )
)

Description

Create the fst argument of tar_resources() to specify optional settings for big data frame storage formats powered by the fst R package. See the format argument of tar_target() for details.

Usage

tar_resources_fst(compress = 50)

Arguments

compress Numeric of length 1, compress argument of fst::write_fst().

Value

Object of class "tar_resources_fst", to be supplied to the fst argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x, my_command(), resources = resources_2), then everything in resources_1 is discarded for target x.

See Also

Other resources: tar_resources_aws(), tar_resources_clustermq(), tar_resources_feather(), tar_resources_future(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url(), tar_resources()
Examples

# Somewhere in your target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "fst_tbl",
  resources = tar_resources(
    fst = tar_resources_fst(compress = 100)
  )
)

Description

Create the future argument of tar_resources() to specify optional high-performance computing settings for tar_make_future(). This is how to supply the resources argument of future::future() for targets. Resources supplied through future::plan() and future::tweak() are completely ignored. For details, see the documentation of the future R package and the corresponding argument names in this help file.

Usage

```r
baseline::tar_resources_future(plan = NULL, resources = list())
```

Arguments

- **plan**: A future::plan() object or NULL, a target-specific future plan.
- **resources**: Named list, resources argument to future::future().

Value

Object of class "tar_resources_future", to be supplied to the future argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each take an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x, my_command(), resources = resources_2), then everything in resources_1 is discarded for target x.
See Also

Other resources: `tar_resources_aws()`, `tar_resources_clustermq()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`, `tar_resources()`

Examples

```r
# Somewhere in your target script file (usually _targets.R):

 tar_target(
   name,
   command(),
   resources = tar_resources(  
     future = tar_resources_future(resources = list(n_cores = 2))
   )
)
```

---

### `tar_resources_parquet` Target resources: parquet storage formats

**Description**

Create the `parquet` argument of `tar_resources()` to specify optional settings for parquet data frame storage formats powered by the arrowR package. See the `format` argument of `tar_target()` for details.

**Usage**

`tar_resources_parquet(compression = "snappy", compression_level = NULL)`

**Arguments**

- `compression` Character of length 1, compression argument of `arrow::write_parquet()`.
- `compression_level` Numeric of length 1, compression_level argument of `arrow::write_parquet()`.

**Value**

Object of class "tar_resources_parquet", to be supplied to the parquet argument of `tar_resources()`.

**Resources**

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with `tar_target()`, all the resources from `tar_option_get("resources")` are dropped for that target. In other words, if you write `tar_option_set(resources = resources_1)` and then `tar_target(x, my_command(), resources = resources_2)`, then everything in `resources_1` is discarded for target `x`. 
See Also

Other resources: tar_resources_aws(), tar_resources_clustermq(), tar_resources_feather(), tar_resources_fst(), tar_resources_future(), tar_resources_qs(), tar_resources_url(), tar_resources()

Examples

# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "parquet",
  resources = tar_resources(
    parquet = tar_resources_parquet(compression = "lz4")
  )
)

## tar_resources_qs

Target resources: qs storage formats

Description

Create the qs argument of tar_resources() to specify optional settings for big data storage formats powered by the qs R package. See the format argument of tar_target() for details.

Usage

tar_resources_qs(preset = "high")

Arguments

preset Character of length 1, preset argument of qs::qsave().

Value

Object of class "tar_resources_qs", to be supplied to the qs argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x,my_command(),resources = resources_2), then everything in resources_1 is discarded for target x.
See Also

Other resources: tar_resources_aws(), tar_resources_clustermq(), tar_resources_feather(),
tar_resources_fst(), tar_resources_future(), tar_resources_parquet(), tar_resources_url(),
tar_resources()

Examples

# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "qs",
  resources = tar_resources(
    qs = tar_resources_qs(preset = "fast")
  )
)

---

**tar_resources_url**  
Target resources: URL storage formats

Description

Create the url argument of tar_resources() to specify optional settings for URL storage formats. See the format argument of tar_target() for details.

Usage

tar_resources_url(handle = NULL)

Arguments

- **handle**: Object returned by curl::new_handle or NULL.

Value

Object of class "tar_resources_url", to be supplied to the url argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner. Resources are all-or-nothing: if you specify any resources with tar_target(), all the resources from tar_option_get("resources") are dropped for that target. In other words, if you write tar_option_set(resources = resources_1) and then tar_target(x,my_command(),resources = resources_2), then everything in resources_1 is discarded for target x.
See Also

Other resources: `tar_resources_aws()`, `tar_resources_clustermq()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  # Somewhere in you target script file (usually _targets.R):
  tar_target(
    name, 
    command(), 
    format = "url", 
    resources = tar_resources(
      url = tar_resources_url(handle = curl::new_handle())
    )
  )
}
```

---

**tar_script**

Write a target script file.

Description

The `tar_script()` function is a convenient way to create the required target script file (default: _targets.R) in the current working directory. It always overwrites the existing target script, and it requires you to be in the working directory where you intend to write the file, so be careful. See the “Target script” section for details.

Usage

```r
tar_script(
  code = NULL, 
  library_targets = TRUE, 
  ask = NULL, 
  script = targets::tar_config_get("script")
)
```

Arguments

- `code` R code to write to the target script file. If NULL, an example target script file is written instead.
- `library_targets` logical, whether to write a `library(targets)` line at the top of the target script file automatically (recommended). If TRUE, you do not need to explicitly put `library(targets)` in code.
**tar_script**

Logical, whether to ask before writing if the target script file already exists. If NULL, defaults to Sys.getenv("TAR_ASK"). (Set to "true" or "false" with Sys.setenv()). If ask and the TAR_ASK environment variable are both indeterminate, defaults to interactive().

**script**

Character of length 1, where to write the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R.

**Value**

NULL (invisibly).

**Target script file**

Every targets project requires a target script file. The target script file is usually a file called _targets.R. Functions tar_make() and friends look for the target script and run it to set up the pipeline just prior to the main task. Every target script file should run the following steps in the order below: 1. Package: load the targets package. This step is automatically inserted at the top of the target script file produced by tar_script() if library_targets is TRUE, so you do not need to explicitly include it in code. 1. Globals: load custom functions and global objects into memory. Usually, this section is a bunch of calls to source() that run scripts defining user-defined functions. These functions support the R commands of the targets. 2. Options: call tar_option_set() to set defaults for targets-specific settings such as the names of required packages. Even if you have no specific options to set, it is still recommended to call tar_option_set() in order to register the proper environment. 3. Targets: define one or more target objects using tar_target(). 4. Pipeline: call list() to bring the targets from (3) together in a pipeline object. Every target script file must return a pipeline object, which usually means ending with a call to list(). In practice, (3) and (4) can be combined together in the same function call.

**See Also**

Other scripts: tar_edit(), tar_github_actions(), tar_helper_raw(), tar_helper(), tar_renv()

**Examples**

tar_dir({ # tar_dir() runs code from a temporary directory.
  tar_script() # Writes an example target script file.
  # Writes a user-defined target script:
  tar_script(
    x <- tar_target(x, 1 + 1)
    tar_option_set()
    list(x)
  ), ask = FALSE)
  writelines(readLines("_targets.R"))
})
tar_seed

Get the random number generator seed of the target currently running.

Description

Get the random number generator seed of the target currently running.

Usage

tar_seed(default = 1L)

Arguments

default Integer, value to return if tar_seed() is called on its own outside a targets pipeline. Having a default lets users run things without tar_make(), which helps peel back layers of code and troubleshoot bugs.

Details

A target’s random number generator seed is a deterministic function of its name. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can retrieve the seed of a completed target with tar_meta(your_target,seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

Value

Integer of length 1. If invoked inside a targets pipeline, the return value is the seed of the target currently running, which is a deterministic function of the target name. Otherwise, the return value is default.

See Also

Other utilities: tar_cancel(), tar_envir(), tar_group(), tar_name(), tar_path()

Examples

tar_seed()
tar_seed(default = 123L)
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir({ # tar_dir() runs code from a temporary directory.
tar_script(tar_target(returns_seed, tar_seed()), ask = FALSE)
tar_make()
tar_read(returns_seed)
})
}
**Description**

For each target, report which cues are activated. Except for the never cue, the target will rerun in `tar_make()` if any cue is activated. The target is suppressed if the never cue is TRUE. See `tar_cue()` for details.

**Usage**

```r
tar_sitrep(
  names = NULL,
  fields = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  reporter = targets::tar_config_get("reporter_outdated"),
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **names**: Optional, names of the targets. If supplied, `tar_sitrep()` only returns metadata on these targets. You can supply symbols or tidyselect helpers like `starts_with()`.

- **fields**: Optional, names of columns/fields to select. If supplied, `tar_sitrep()` only returns the selected metadata columns. You can supply symbols or tidyselect helpers like `all_of()` and `starts_with()`. The name column is always included first no matter what you select. Choices:
  - **name**: name of the target or global object.
  - **record**: Whether the record cue is activated: TRUE if the target is not in the metadata (`tar_meta()`), or if the target errored during the last `tar_make()`, or if the class of the target changed.
  - **always**: Whether mode in `tar_cue()` is "always". If TRUE, `tar_make()` always runs the target.
  - **never**: Whether mode in `tar_cue()` is "never". If TRUE, `tar_make()` will only run if the record cue activates.
  - **command**: Whether the target’s command changed since last time. Always TRUE if the record cue is activated. Otherwise, always FALSE if the command cue is suppressed.
  - **depend**: Whether the data/output of at least one of the target’s dependencies changed since last time. Dependencies are targets, functions, and global objects directly upstream. Call `tar_outdated(targets_only = FALSE)`
or tar_visnetwork(targets_only = FALSE) to see exactly which dependencies are outdated. Always NA if the record cue is activated. Otherwise, always FALSE if the depend cue is suppressed.

- **format**: Whether the storage format of the target is different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the format cue is suppressed.

- **iteration**: Whether the iteration mode of the target is different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the iteration cue is suppressed.

- **file**: Whether the file(s) with the target's return value are missing or different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the file cue is suppressed.

**shortcut** Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Use with caution. shortcut = TRUE only works if you set names.

**reporter** Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:
- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

**callr_function** A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

**callr_arguments** A list of arguments to callr_function.

**envir** An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

**script** Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function
call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

### Details

#### Caveats:

- `tar_cue()` allows you to change/suppress cues, so the return value will depend on the settings you supply to `tar_cue()`.
- If a pattern tries to branches over a target that does not exist in storage, then the branches are omitted from the output.
- `tar_sitrep()` is myopic. It only considers what happens to the immediate target and its immediate upstream dependencies, and it makes no attempt to propagate invalidation downstream.

### Value

A data frame with one row per target/object and one column per cue. Each element is a logical to indicate whether the cue is activated for the target. See the field argument in this help file for details.

### See Also

Other inspect: `tar_deps_raw()`, `tar_deps()`, `tar_glimpse()`, `tar_manifest()`, `tar_network()`, `tar_outdated()`, `tar_validate()`, `tar_visnetwork()`

### Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script({
      list(  
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      ), ask = FALSE)
    }, ask = FALSE)
  tar_make()
  tar_sitrep()
  tar_meta(starts_with("y_")) # see also all_of()
}
```
Declare a target.

**Description**

A target is a single step of computation in a pipeline. It runs an R command and returns a value. This value gets treated as an R object that can be used by the commands of targets downstream. Targets that are already up to date are skipped. See the user manual for more details.

**Usage**

```r
tar_target(
    name,
    command,
    pattern = NULL,
    tidy_eval = targets::tar_option_get("tidy_eval"),
    packages = targets::tar_option_get("packages"),
    library = targets::tar_option_get("library"),
    format = targets::tar_option_get("format"),
    iteration = targets::tar_option_get("iteration"),
    error = targets::tar_option_get("error"),
    memory = targets::tar_option_get("memory"),
    garbage_collection = targets::tar_option_get("garbage_collection"),
    deployment = targets::tar_option_get("deployment"),
    priority = targets::tar_option_get("priority"),
    resources = targets::tar_option_get("resources"),
    storage = targets::tar_option_get("storage"),
    retrieval = targets::tar_option_get("retrieval"),
    cue = targets::tar_option_get("cue")
)
```

**Arguments**

- **name**: Symbol, name of the target. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

- **command**: R code to run the target.
pattern  Language to define branching for a target. For example, in a pipeline with numeric vector targets \(x\) and \(y\), \texttt{tar_target}(z, x + y, pattern = map(x, y)) implicitly defines branches of \(z\) that each compute \(x[1] + y[1], x[2] + y[2]\), and so on. See the user manual for details.

tidy_eval  Logical, whether to enable tidy evaluation when interpreting command and pattern. If \texttt{TRUE}, you can use the "bang-bang" operator \texttt{!!} to programmatically insert the values of global objects.

packages  Character vector of packages to load right before the target builds. Use \texttt{tar_option_set()} to set packages globally for all subsequent targets you define.

library  Character vector of library paths to try when loading packages.

format  Optional storage format for the target's return value. With the exception of \texttt{format = "file"}, each target gets a file in \_targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

iteration  Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with \texttt{vctrs::vec_slice()} and aggregation happens with \texttt{vctrs::vec_c()}.
- "list", branching happens with \texttt{[]} and aggregation happens with \texttt{list()}.
- "group": \texttt{dplyr::group_by()}\texttt{-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special tar\_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the \texttt{tar\_group()} function to see how you can create the special tar\_group column with \texttt{dplyr::group\_by()}."

error  Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit \url{https://books.ropensci.org/targets/debugging.html} to learn how to debug targets using saved workspaces.)

memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files such as \texttt{format = "aws\_file"}, this memory strategy applies to temporary local copies of the file in \_targets/scratch": "persistent" means they remain until the end of the pipeline, and "transient" means they get deleted from the file system as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection  Logical, whether to run \texttt{base::gc()} just before the target runs.

deployment  Character of length 1, only relevant to \texttt{tar\_make\_clustermq()} and \texttt{tar\_make\_future()}. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.
priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "main", the target's return value is sent back to the host machine and saved locally. If "worker", the worker saves the value.

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "main", the target's dependencies are loaded on the host machine and sent to the worker before the target builds. If "worker", the worker loads the targets dependencies.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Value

A target object. Users should not modify these directly, just feed them to `list()` in your target script file (default: `_targets.R`).

Storage formats

- "rds": Default, uses `saveRDS()` and `readRDS()`. Should work for most objects, but slow.
- "qs": Uses `qs::qsave()` and `qs::qread()`. Should work for most objects, much faster than "rds". Optionally set the preset for `qsave()` through `tar_resources()` and `tar_resources_qs()`.
- "feather": Uses `arrow::write_feather()` and `arrow::read_feather()` (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and ` compression_level in arrow::write_feather()` through `tar_resources()` and `tar_resources_feather()`. Requires the `arrow` package (not installed by default).
- "parquet": Uses `arrow::write_parquet()` and `arrow::read_parquet()` (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and ` compression_level in arrow::write_parquet()` through `tar_resources()` and `tar_resources_parquet()`. Requires the `arrow` package (not installed by default).
- "fst": Uses `fst::write_fst()` and `fst::read_fst()`. Much faster than "rds", but the value must be a data frame. Optionally set the compression level for `fst::write_fst()` through `tar_resources()` and `tar_resources_fst()`. Requires the `fst` package (not installed by default).
- "fst_dt": Same as "fst", but the value is a data.table. Optionally set the compression level the same way as for "fst".
- "fst_tbl": Same as "fst", but the value is a tibble. Optionally set the compression level the same way as for "fst".
- "keras": Uses `keras::save_model_hdf5()` and `keras::load_model_hdf5()`. The value must be a Keras model. Requires the `keras` package (not installed by default).
- "torch": Uses `torch::torch_save()` and `torch::torch_load()`. The value must be an object from the torch package such as a tensor or neural network module. Requires the torch package (not installed by default).

- "file": A dynamic file. To use this format, the target needs to manually identify or save some data and return a character vector of paths to the data. (These paths must be existing files and nonempty directories.) Then, targets automatically checks those files and cues the appropriate build decisions if those files are out of date. Those paths must point to files or directories, and they must not contain characters | or *. All the files and directories you return must actually exist, or else targets will throw an error. (And if storage is "worker", targets will first stall out trying to wait for the file to arrive over a network file system.)

- "url": A dynamic input URL. It works like format = "file" except the return value of the target is a URL that already exists and serves as input data for downstream targets. Optionally supply a custom curl handle through `tar_resources()` and `tar_resources_url()` in `new_handle()`, `nobody = TRUE` is important because it ensures targets just downloads the metadata instead of the entire data file when it checks time stamps and hashes. The data file at the URL needs to have an ETag or a Last-Modified time stamp, or else the target will throw an error because it cannot track the data. Also, use extreme caution when trying to use format = "url" to track uploads. You must be absolutely certain the ETag and Last-Modified time stamp are fully updated and available by the time the target’s command finishes running. targets makes no attempt to wait for the web server.

- "aws_rds", "aws_qs", "aws_parquet", "aws_fst", "aws_fst_dt", "aws_fst_tbl", "aws_keras": AWS-powered versions of the respective formats "rds", "qs", etc. The only difference is that the data file is uploaded to the AWS S3 bucket you supply to `tar_resources_aws()`. See the cloud computing chapter of the manual for details.

- "aws_file": arbitrary dynamic files on AWS S3. The target should return a path to a temporary local file, then targets will automatically upload this file to an S3 bucket and track it for you. Unlike format = "file", format = "aws_file" can only handle one single file, and that file must not be a directory. `tar_read()` and downstream targets download the file to _targets/scratch/ locally and return the path. _targets/scratch/ gets deleted at the end of `tar_make()`. Requires the same resources and other configuration details as the other AWS-powered formats. See the cloud computing chapter of the manual for details.

Other targets: `tar_cue()`, `tar_target_raw()`

Examples

```r
# Defining targets does not run them.
data <- tar_target(target_name, get_data(), packages = "tidyverse")
analysis <- tar_target(analysis, analyze(x), pattern = map(x))
# Pipelines accept targets.
pipeline <- list(data, analysis)
# Tidy evaluation
tar_option_set(envir = environment())
n_rows <- 30L
data <- tar_target(target_name, get_data(!n_rows))
print(data)
# Disable tidy evaluation:
```

data <- tar_target(target_name, get_data(!n_rows), tidy_eval = FALSE)
print(data)
tar_option_reset()
# In a pipeline:
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
tar_dir()  # tar_dir() runs code from a temporary directory.
tar_script(tar_target(x, 1 + 1), ask = FALSE)
tar_make()
tar_read(x)
}
}

---

**tar_target_raw**

Define a target using unrefined names and language objects.

**Description**

`tar_target_raw()` is just like `tar_target()` except it avoids non-standard evaluation for the arguments: `name` is a character string, `command` and `pattern` are language objects, and there is no `tidy_eval` argument. Use `tar_target_raw()` instead of `tar_target()` if you are creating entire batches of targets programmatically (metaprogramming, static branching).

**Usage**

```r

tar_target_raw(
  name,
  command,
  pattern = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  deps = NULL,
  string = NULL,
  format = targets::tar_option_get("format"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)

```
Arguments

name Character of length 1, name of the target. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target's initial RNG state.

command Similar to the command argument of `tar_target()` except the object must already be an expression instead of informally quoted code. `base::expression()` and `base::quote()` can produce such objects.

pattern Similar to the pattern argument of `tar_target()` except the object must already be an expression instead of informally quoted code. `base::expression()` and `base::quote()` can produce such objects.

packages Character vector of packages to load right before the target builds. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

deps Optional character vector of the adjacent upstream dependencies of the target, including targets and global objects. If NULL, dependencies are resolved automatically as usual.

string Optional string representation of the command. Internally, the string gets hashed to check if the command changed since last run, which helps targets decide whether the target is up to date. External interfaces can take control of string to ignore changes in certain parts of the command. If NULL, the strings is just deparsed from command (default).

format Optional storage format for the target's return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

iteration Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list", branching happens with `[[[]] and aggregation happens with `list()`.
- "group": `dplyr::group_by()`-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

error Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files such as format = "aws_file", this memory strategy applies to temporary local copies of the file in _targets/scratch/": "persistent" means they remain until the end of the pipeline, and "transient" means they get deleted from the file system as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "main", the target’s return value is sent back to the host machine and saved locally. If "worker", the worker saves the value.

retrieval Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "main", the target’s dependencies are loaded on the host machine and sent to the worker before the target builds. If "worker", the worker loads the targets dependencies.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Value A target object. Users should not modify these directly, just feed them to list() in your target script file (default: _targets.R).

See Also Other targets: tar_cue(), tar_target()
Examples

# The following are equivalent.
y <- tar_target(y, sqrt(x), pattern = map(x))
y <- tar_target_raw("y", expression(sqrt(x)), expression(map(x)))

# Programmatically create a chain of interdependent targets
target_list <- lapply(seq_len(4), function(i) {
  tar_target_raw(
    letters[i + 1],
    substitute(do_something(x), env = list(x = as.symbol(letters[i])))
  )
})
print(target_list[[1]])
print(target_list[[2]])
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tar_script(tar_target_raw("x", quote(1 + 1)), ask = FALSE)
    tar_make()
    tar_read(x)
  })
}

---

**tar_test**

*Test code in a temporary directory.*

---

**Description**

Runs a `test_that()` unit test inside a temporary directory to avoid writing to the user's file space. This helps ensure compliance with CRAN policies. Also isolates `tar_option_set()` options and environment variables specific to targets and skips the test on Solaris. Useful for writing tests for `targetopia` packages (extensions to targets tailored to specific use cases).

**Usage**

`tar_test(label, code)`

**Arguments**

- `label` Character of length 1, label for the test.
- `code` User-defined code for the test.

**Value**

`NULL` (invisibly).

**See Also**

Other utilities to extend targets: `tar_assert`, `tar_condition`, `tar_dir()`, `tar_language`
Examples

tar_test("example test", {
  testing_variable_cafecfcb <- "only defined inside tar_test()"
  file.create("only_exists_in_tar_test")
})
exists("testing_variable_cafecfcb")
file.exists("only_exists_in_tar_test")

Description

Get the time that a target last ran successfully. If there are multiple artifacts, as with file or URL targets, then multiple time stamps may be returned.

Usage

```
 tar_timestamp(
   name = NULL,
   format = NULL,
   tz = NULL,
   parse = NULL,
   store = targets::tar_config_get("store")
 )
```

Arguments

- **name**
  - Symbol, name of the target. If NULL (default) then tar_timestamp() will attempt to return the timestamp of the target currently running. Must be called inside a target's command or a supporting function in order to work.

- **format**
  - Deprecated in targets version 0.6.0 (2021-07-21).

- **tz**
  - Deprecated in targets version 0.6.0 (2021-07-21).

- **parse**
  - Deprecated in targets version 0.6.0 (2021-07-21).

- **store**
  - Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets_. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

tar_timestamp() checks the metadata in _targets/meta/meta, not the actual data. Time stamps are recorded only for targets that run commands: just non-branching targets and individual dynamic branches.
Value

If the target is not recorded in the metadata or cannot be parsed correctly, then `tar_timestamp()` returns a `POSIXct` object at `1970-01-01 UTC`.

See Also

Other time: `tar_newer()`, `tar_older()`, `tar_timestamp_raw()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # `tar_dir()` runs code from a temporary directory.
    tar_script(
      list(tar_target(x, 1))
    ), ask = FALSE)
  tar_make()
  # Get the timestamp.
  tar_timestamp(x)
  # We can use the timestamp to cancel the target
  # if it already ran within the last hour.
  # Be sure to set `cue = tar_cue(mode = "always")`
  # if you want the target to always check the timestamp.
  tar_script(
    list(
      tar_target(
        x,
        tar_cancel((Sys.time() - tar_timestamp()) < 3600),
        cue = tar_cue(mode = "always")
      )
    ), ask = FALSE)
  tar_make()
})
```

---

**tar_timestamp_raw** Get the timestamp(s) of a target (raw version).

Description

Get the time that a target last ran successfully.

Usage

```r
tar_timestamp_raw(
  name = NULL,
  format = NULL,
  tz = NULL,
  parse = NULL,
  store = targets::tar_config_get("store")
)
```
Arguments

- **name**: Character of length 1, name of the target.
- **format**: Deprecated in targets version 0.6.0 (2021-07-21).
- **tz**: Deprecated in targets version 0.6.0 (2021-07-21).
- **parse**: Deprecated in targets version 0.6.0 (2021-07-21).
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

tar_timestamp_raw() is like tar_timestamp() except it accepts a character string for name instead of a symbol. tar_timestamp_raw() checks the metadata in `_targets/meta/meta`, not the actual data. Time stamps are recorded only for targets that run commands: just non-branching targets and individual dynamic branches.

Value

If the target is not recorded in the metadata or cannot be parsed correctly, then `tar_timestamp_raw()` returns a `POSIXct` object at 1970-01-01 UTC.

See Also

Other time: `tar_newer()`, `tar_older()`, `tar_timestamp()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # `tar_dir()` runs code from a temporary directory.
    tar_script({
      list(tar_target(x, 1))
    }, ask = FALSE)
    tar_make()
    # Get the timestamp.
    tar_timestamp_raw("x")
    # We can use the timestamp to cancel the target
    # if it already ran within the last hour.
    # Be sure to set "cue = tar_cue(mode = "always")"
    # if you want the target to always check the timestamp.
    tar_script({
      list(
        tar_target(
          x,
          tar_cancel((Sys.time() - tar_timestamp_raw()) < 3600),
          cue = tar_cue(mode = "always")
        )
      ), ask = FALSE)
```
Return the saved traceback of a target. Assumes the target errored out in a previous run of the pipeline with workspaces enabled for that target. See tar_workspace() for details.

Usage

tar_traceback(
  name,
  envir = NULL,
  packages = NULL,
  source = NULL,
  characters = getOption("width"),
  store = targets::tar_config_get("store")
)

Arguments

  name            Symbol, name of the target whose workspace to read.
  envir           Deprecated in targets > 0.3.1 (2021-03-28).
  packages        Logical, whether to load the required packages of the target.
  source          Logical, whether to run the target script file (default: _targets.R) to load user-defined global object dependencies into envir. If TRUE, then envir should either be the global environment or inherit from the global environment.
  characters      Positive integer. Each line of the traceback is shortened to this number of characters.
  store           Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

  Character vector, the traceback of a failed target if it exists.

See Also

  Other debug: tar_load Globals(), tar_workspaces(), tar_workspace()
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tmp <- sample(1)
    tar_script({
      tar_option_set(workspace_on_error = TRUE)
      list(
        tar_target(x, "loaded"),
        tar_target(y, stop(x))
      ), ask = FALSE)
    try(tar_make())
    tar_traceback(y, characters = 60)
  })
}
```

---

**tar_unscript**  
Remove target script helper files.

**Description**

Target Markdown writes helper scripts in a folder accompanying the target script file. If the target script is the default `_targets.R`, the helper scripts are in `_targets_r/`. If the some other location like `custom/script.R`, the helper scripts are in `custom/script_r/`. Use `tar_unscript()` to remove all these helper scripts in the `*_r/` directory. The actual target script is not removed.

**Usage**

```r
tar_unscript(script = targets::tar_config_get("script"))
```

**Arguments**

- `script`  
  Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**Value**

NULL (invisibly).

**Examples**

```r
tar_dir({ # tar_dir() runs code from a temporary directory.
  tar_unscript()
})
```
**tar_validate**

Validate a pipeline of targets.

**Description**

Inspect the pipeline for issues and throw an error or warning if a problem is detected.

**Usage**

```r
tar_validate(
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- `callr_function`: A function from `callr` to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.

- `callr_arguments`: A list of arguments to `callr_function`.

- `envir`: An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

  The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir` you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

- `script`: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call.
call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

NULL except if `callr_function = callr::r_bg()`, in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

See Also

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir( # tar_dir() runs code from a temporary directory.
            tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
            tar_validate()
  }
}
```

---

**tar_visnetwork**

*Visualize an abridged fast dependency graph.*

Description

Analyze the pipeline defined in the target script file (default: `_targets.R`) and visualize the directed acyclic graph of targets and global functions and objects.

Usage

```r
tar_visnetwork(
  targets_only = FALSE,
  names = NULL,
  shortcut = FALSE,
  allow = NULL,
  exclude = ".Random.seed",
  outdated = TRUE,
  label = NULL,
  level_separation = NULL,
  degree_from = 1L,
  degree_to = 1L,
  reporter = targets::tar_config_get("reporter_outdated"),
  callr_function = callr::r,
  callr_arguments = targets::callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```
Arguments

**targets_only**  Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.

**names**  Names of targets. The graph visualization will operate only on these targets (and unless **shortcut** is TRUE, all the targets upstream as well). Selecting a small subgraph using names could speed up the load time of the visualization. Unlike **allow**, names is invoked before the graph is generated. Set to NULL to check/build all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

**shortcut**  Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

**allow**  Optional, define the set of allowable vertices in the graph. Unlike names, allow is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with().

**exclude**  Optional, define the set of exclude vertices from the graph. Unlike names, exclude is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like all_of() and starts_with().

**outdated**  Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and build progress.

**label**  Character vector of one or more aesthetics to add to the vertex labels. Can contain "time" to show total runtime, "size" to show total storage size, or "branches" to show the number of branches in each pattern. You can choose multiple aesthetics at once, e.g. label = c("time","branches"). All are disabled by default because they clutter the graph.

**level_separation**  Numeric of length 1, levelSeparation argument of visNetwork::visHierarchicalLayout(). Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If level_separation is NULL, the levelSeparation argument of visHierarchicalLayout() defaults to 150.

**degree_from**  Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_from controls the number of edges the neighborhood extends upstream.

**degree_to**  Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.
represent the plain text of the page.
tar_dir(# tar_dir() runs code from a temporary directory.
tar_script(
    tar_option_set()
    list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
    )
))
tar_visnetwork()
tar_visnetwork(allow = starts_with("y")) # see also all_of()
)
)

---

**tar_watch**  
*Shiny app to watch the dependency graph.*

**Description**

Launches a background process with a Shiny app that calls `tar_visnetwork()` every few seconds. To embed this app in other apps, use the Shiny module in `tar_watch_ui()` and `tar_watch_server()`.

**Usage**

```
tar_watch(
    seconds = 10,
    seconds_min = 1,
    seconds_max = 60,
    seconds_step = 1,
    targets_only = FALSE,
    exclude = ".Random.seed",
    outdated = FALSE,
    label = NULL,
    level_separation = 150,
    degree_from = 1L,
    degree_to = 1L,
    config = ".targets.yaml",
    height = "650px",
    display = "summary",
    displays = c("summary", "branches", "progress", "graph", "about"),
    background = TRUE,
    browse = TRUE,
    host = getOption("shiny.host", "127.0.0.1"),
    port = getOption("shiny.port", targets::tar_random_port()),
    verbose = TRUE,
    supervise = TRUE
    )
```

Arguments

seconds  Numeric of length 1, default number of seconds between refreshes of the graph. Can be changed in the app controls.
seconds_min Numeric of length 1, lower bound of seconds in the app controls.
seconds_max Numeric of length 1, upper bound of seconds in the app controls.
seconds_step Numeric of length 1, step size of seconds in the app controls.
targets_only Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.
exclude Character vector of nodes to omit from the graph.
outdated Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and build progress.
label Label argument to tar_visnetwork().
level_separation Numeric of length 1, levelSeparation argument of visNetwork::visHierarchicalLayout(). Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If level_separation is NULL, the levelSeparation argument of visHierarchicalLayout() defaults to 150.
degree_from Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_from controls the number of edges the neighborhood extends upstream.
degree_to Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.
config Character of length 1, path to the YAML file with all the configuration settings (default: _targets.yaml).
height Character of length 1, height of the visNetwork widget and branches table.
display Character of length 1, which display to show first.
displays Character vector of choices for the display. Elements can be any of "graph", "summary", "branches", or "about".
background Logical, whether to run the app in a background process so you can still use the R console while the app is running.
browse Whether to open the app in a browser when the app is ready. Only relevant if background is TRUE.
host Character of length 1, IPv4 address to listen on. Only relevant if background is TRUE.
port Positive integer of length 1, TCP port to listen on. Only relevant if background is TRUE.
verbose whether to print a spinner and informative messages. Only relevant if background is TRUE.
supervise Whether to register the process with a supervisor. If TRUE, the supervisor will ensure that the process is killed when the R process exits.
Details

The controls of the app are in the left panel. The seconds control is the number of seconds between refreshes of the graph, and the other settings match the arguments of `tar_visnetwork()`.

Value

A handle to `callr::r_bg()` background process running the app.

      }
      list(
        tar_target(settings, sleep_run()),
        tar_target(data1, sleep_run(settings)),
        tar_target(data2, sleep_run(settings))
      )
    }, ask = FALSE)
    # Launch the app in a background process.
    tar_watch(seconds = 10, outdated = FALSE, targets_only = TRUE)
    # Run the pipeline.
    tar_make()
  })
}
```

---

**tar_watch_server**  
*Shiny module server for tar_watch()*

Description

Use `tar_watch_ui()` and `tar_watch_server()` to include `tar_watch()` as a Shiny module in an app.

Usage

```r
tar_watch_server(
  id,
  height = "650px",
  exclude = ".Random.seed",
  config = ".targets.yaml"
)
```
Arguments

- **id**: Character of length 1, ID corresponding to the UI function of the module.
- **height**: Character of length 1, height of the `visNetwork` widget and branches table.
- **exclude**: Character vector of nodes to omit from the graph.
- **config**: Character of length 1, path to the YAML file with all the configuration settings (default: `_targets.yaml`).

Value

A Shiny module server.

---

tar_watch_ui

Shiny module UI for tar_watch()

---

Description

Use `tar_watch_ui()` and `tar_watch_server()` to include `tar_watch()` as a Shiny module in an app.

Usage

```r
# tar_watch_ui()
# label = "tar_watch_label",
# seconds = 10,
# seconds_min = 1,
# seconds_max = 60,
# seconds_step = 1,
# targets_only = FALSE,
# outdated = FALSE,
# label_tar_visnetwork = NULL,
# level_separation = 150,
# degree_from = 1L,
# degree_to = 1L,
# height = "650px",
# display = "summary",
# displays = c("summary", "branches", "progress", "graph", "about")
```

Arguments

- **id**: Character of length 1, ID corresponding to the UI function of the module.
- **label**: Label for the module.
- **seconds**: Numeric of length 1, default number of seconds between refreshes of the graph. Can be changed in the app controls.
- **seconds_min**: Numeric of length 1, lower bound of seconds in the app controls.
- **seconds_max**: Numeric of length 1, upper bound of seconds in the app controls.
- **seconds_step**: Numeric of length 1, step size of seconds in the app controls.
- **targets_only**: Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.
- **outdated**: Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and build progress.
- **label_tar_visnetwork**: Character vector, label argument to `tar_visnetwork()`.
- **level_separation**: Numeric of length 1, levelSeparation argument of `visNetwork::visHierarchicalLayout()`. Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If level_separation is NULL, the levelSeparation argument of visHierarchicalLayout() defaults to 150.
- **degree_from**: Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_from controls the number of edges the neighborhood extends upstream.
- **degree_to**: Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.
- **height**: Character of length 1, height of the visNetwork widget and branches table.
- **display**: Character of length 1, which display to show first.
- **displays**: Character vector of choices for the display. Elements can be any of "graph", "summary", "branches", or "about".

Value

A Shiny module UI.

See Also

Other progress: `tar_poll()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_progress()`, `tar_watch_server()`, `tar_watch()`
Load a saved workspace and seed for debugging.

Description

Load the packages, workspace, and random number generator seed of target attempted with a workspace file.

Usage

tar_workspace(
  name,
  envir = parent.frame(),
  packages = TRUE,
  source = TRUE,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)

Arguments

name Symbol, name of the target whose workspace to read.
envir Environment in which to put the objects.
packages Logical, whether to load the required packages of the target.
source Logical, whether to run _targets.R to load user-defined global object dependencies into envir. If TRUE, then envir should either be the global environment or inherit from the global environment.
script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

If you activate workspaces through the workspaces argument of tar_option_set(), then under the circumstances you specify, targets will save a special workspace file to a location in _targets/workspaces/. The workspace file is a compact reference that allows tar_workspace() to load the target's dependencies and random number generator seed as long as the data objects are still in the data store (usually files in _targets/objects/). When you are done debugging, you can remove the workspace files using tar_destroy(destroy = "workspaces").
**tar_workspaces**

**Value**

This function returns NULL, but it does load the target’s required packages, as well as multiple objects into the environment (envir argument) in order to replicate the workspace where the error happened. These objects include the global objects at the time `tar_make()` was called and the dependency targets. The random number generator seed for the target is also assigned with `set.seed()`.

**See Also**

Other debug: `tar_load Globals()`, `tar_traceback()`, `tar_workspaces()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temporary directory.
    tmp <- sample(1)
    tar_script({
      tar_option_set(workspace_on_error = TRUE)
      list(
        tar_target(x, "loaded"),
        tar_target(y, stop(x))
      )
    }, ask = FALSE)
    # The following code throws an error for demonstration purposes.
    try(tar_make())
    exists("x") # Should be FALSE.
    tail(.Random.seed) # for comparison to the RNG state after tar_workspace(y)
    tar_workspace(y)
    exists("x") # Should be TRUE.
    print(x) # "loaded"
    # Should be different: tar_workspace() runs set.seed(tar_meta(y, seed)$seed)
    tail(.Random.seed)
  })
}
```

**Description**

List target workspaces currently saved to _targets/workspaces/. See `tar_workspaces()` for more information.

**Usage**

```r
tar_workspaces(names = NULL, store = targets::tar_config_get("store"))
```
Arguments

names  Optional tidyselect selector to return a tactical subset of workspace names. If NULL, all names are selected.

store  Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value

Character vector of available workspaces to load with tar_workspaces().

See Also

Other debug: tar_load_globals(), tar_traceback(), tar_workspace()
use_targets

Arguments

  path Character of length 1, output path of the Target Markdown report relative to the current active project.
  open Logical, whether to open the file for editing in the RStudio IDE.

Value

  NULL (invisibly).
