Package ‘textfeatures’

Type Package
Title Extracts Features from Text
Version 0.3.3
Description A tool for extracting some generic features (e.g., number of words, line breaks, characters per word, URLs, lower case, upper case, commas, periods, exclamation points, etc.) from strings of text.
License MIT + file LICENSE
URL https://github.com/mkearney/textfeatures
BugReports https://github.com/mkearney/textfeatures/issues
Depends R (>= 3.1.0)
Imports dplyr, purrr, rlang, text2vec, tfse, tibble, tokenizers, utils, stats
Suggests knitr, roxygen2, testthat, covr
Encoding UTF-8
LazyData yes
RoxygenNote 6.1.1
NeedsCompilation no

count_functions

List of all feature counting functions

Description
List of all feature counting functions

Usage
count_functions

Format
Named list of all feature counting functions

n_words Number of words.
n_uq_words Number of unique words.
n_chars Number of characters. Not counting urls, hashtags, mentions or white spaces.
n_uq_chars Number of unique characters. Not counting urls, hashtags, mentions or white spaces.
n_digits Number of digits.
n_hashtags Number of hashtags, word preceded by a '#'.
n_uq_hashtags Number of unique hashtags, word preceded by a '#'.
n_mentions Number of mentions, word preceded by a '@'.
n_uq_mentions Number of unique mentions, word preceded by a '@'.
n_commas Number of commas.
n_periods Number of periods.
n_exclaims Number of exclamation points.
n_extraspaces Number of times more then 1 consecutive space have been used.
n_caps Number of upper case characters.
n_lowers Number of lower case characters.
n_urls Number of urls.
n_uq_urls Number of unique urls.
n_nonasciis Number of non ascii characters.
n_puncts Number of punctuations characters, not including exclamation points, periods and commas.

politeness Summed sentiment value calculated using politeness_dict.
first_person Number of "first person" words.
first_personpl Number of "first person plural" words.
second_person Number of "second person" words.
second_personp Number of "second person plural" words.
third_person Number of "third person" words.
to_be Number of "to be" words.
prepositions Number of preposition words.
Details

In this function we refer to "first person", "first person plural" and so on. This list describes what words are contained in each group.

first person  I, me, myself, my, mine, this.
first person plural  we, us, our, ours, these.
second person  you, yours, your, yourself.
second person plural  he, she, it, its, his, hers.
third person  they, them, theirs, their, they're, their's, those, that.
to be  am, is, are, was, were, being, been, be, were, be.

prepositions  about, below, excepting, off, toward, above, beneath, on, under, across, from, onto, underneath, after, between, in, out, until, against, beyond, outside, up, along, but, inside, over, upon, among, by, past, around, concerning, regarding, with, at, despite, into, since, within, down, like, through, without, before, during, near, throughout, behind, except, of, to, for.

scale_count: Transforms integer and integerlike columns using log
scale_log: Transforms numeric columns using log
scale_normal: Transforms numeric columns using mean centering and dividing by standard deviation
scale_standard: Transforms numeric columns onto 0-1 scales with 0 and 1 set empirically
scale_sqrt: Transforms numeric columns using sqrt

Usage

scale_count(x)
scale_log(x)
scale_normal(x)
scale_standard(x)
scale_sqrt(x)

Arguments

x  Input data frame containing numeric columns.
Details

Scale transformations are applied only to numeric (or in the case of scale_count only integer or integerish) columns that are not named "id" or "(\.|_)?id".

Value

A data frame with the same dimensions but with the numeric/relevant variables transformed.

Description

Extracts features from text vector.

Usage

textfeatures(text, sentiment = TRUE, word_dims = NULL, normalize = TRUE, newdata = NULL, verbose = TRUE)

Arguments

text Input data. Should be character vector or data frame with character variable of interest named "text". If a data frame then the first "id*._id" variable, if found, is assumed to be an ID variable.
sentiment Logical, indicating whether to return sentiment analysis features, the variables sent_afinn and sent_bing. Defaults to TRUE. Setting this to FALSE will speed things up a bit.
word_dims Integer indicating the desired number of word2vec dimension estimates. When NULL, the default, this function will pick a reasonable number of dimensions (ranging from 2 to 200) based on size of input. To disable word2vec estimates, set this to 0 or FALSE.
normalize Logical indicating whether to normalize (mean center, sd = 1) features. Defaults to TRUE.
newdata If a textfeatures_model is supplied to text, supply this with new data to which you would like to apply the textfeatures_model.
verbose A single logical for printing logging messages as work progresses.

Value

A tibble data frame with extracted features as columns.
Examples

```r
## the text of five of Trump's most retweeted tweets
trump_tweets <- c(
  "#FraudNewsCNN #FNN https://t.co/WYUnHjJUJg",
  "TODAY WE MAKE AMERICA GREAT AGAIN!",
  paste("Why would Kim Jong-un insult me by calling me \"old,\" when I would",
        "NEVER call him \"short and fat?\" Oh well, I try so hard to be his",
        "friend - and maybe someday that will happen!"),
  paste("Such a beautiful and important evening! The forgotten man and woman",
        "will never be forgotten again. We will all come together as never before"),
  paste("North Korean Leader Kim Jong Un just stated that the \"Nuclear",
        "Button is on his desk at all times.\" Will someone from his depleted and",
        "food starved regime please inform him that I too have a Nuclear Button,",
        "but it is a much bigger & more powerful one than his, and my Button",
        "works!")
)

## get the text features of a character vector
textfeatures(trump_tweets)

## data frame with a character vector named "text"
df <- data.frame(
  id = c(1, 2, 3),
  text = c("this is A!\t sEntence https://github.com about #rstats @github",
           "and another sentence here",
           "The following list:\n- one\n- two\n- three\nOkay!?!"),
  stringsAsFactors = FALSE
)

## get text features of a data frame with "text" variable
textfeatures(df)
```

---

**word_dims_newtext**  
Calculates word2vec dimension estimates

### Description
Calculates word2vec dimension estimates

### Usage

```r
word_dims_newtext(lda_model, text, n_iter = 20)

word_dims(text, n = 10, n_iter = 20)
```
Arguments

- `lda_model` A pretrained LDA model from `text2vec`.
- `text` Input data. Should be character vector.
- `n_iter` Integer, number of sampling iterations.
- `n` Integer, determines the number of latent topics.

Value

A tibble data frame

Examples

trump_tweets <- c("#FraudNewsCNN #FNN https://t.co/WYUnHjjUjg",
"TODAY WE MAKE AMERICA GREAT AGAIN!",
paste("Why would Kim Jong-un insult me by calling me \"old,\" when I would",
  "NEVER call him \"short and fat?\" Oh well, I try so hard to be his",
  "friend - and maybe someday that will happen!"),
paste("Such a beautiful and important evening! The forgotten man and woman",
  "will never be forgotten again. We will all come together as never before"),
paste("North Korean Leader Kim Jong Un just stated that the \"Nuclear",
  "Button is on his desk at all times.\" Will someone from his depleted and",
  "food starved regime please inform him that I too have a Nuclear Button,",
  "but it is a much bigger & more powerful one than his, and my Button",
  "works!")
)
