Package ‘tidyvpc’

January 18, 2024

Type Package

Title VPC Percentiles and Prediction Intervals

Version 1.5.1

Description Perform a Visual Predictive Check (VPC), while accounting for stratification, censoring, and prediction correction. Using piping from ‘magrittr’, the intuitive syntax gives users a flexible and powerful method to generate VPCs using both traditional binning and a new binless approach Jamsen et al. (2018) <doi:10.1002/psp4.12319> with Additive Quantile Regression (AQR) and Locally Estimated Scatterplot Smoothing (LOESS) prediction correction.

bininfo

Obtain information about the bins from a `tidyvpcobj`

Description

Obtain information about the bins from a `tidyvpcobj`

Usage

```
bininfo(o, ...)
```

## S3 method for class 'tidyvpcobj'
bininfo(o, by.strata = o$bin.by.strata, ...)

Arguments

- o: An object.
- ...: Additional arguments.
- by.strata: Should the calculations be done by strata? Defaults to what was specified when the binning was done.

Value

A `data.table` containing the following columns:

- `nobs`: Number of observed data points in the bin
- `xmedian`: Median x-value of the observed data points in the bin
- `xmean`: Mean x-value of the observed data points in the bin
- `xmax`: Maximum x-value of the observed data points in the bin
- `xmin`: Minimum x-value of the observed data points in the bin
- `xmid`: Value halfway between `xmin` and `xmax`. x-value of the observed data points in the bin
- `xleft`: Value halfway between the minimum x-value of the current bin and the maximum x-value of the previous bin to the left (for the left-most bin, it is the minimum x-value).
- `xright`: Value halfway between the maximum x-value of the current bin and the minimum x-value of the next bin to the right (for the right-most bin, it is the maximum x-value).
- `xcenter`: Value halfway between `xleft` and `xright`.

In addition, if stratification was performed, the stratification columns will be included as well.

Methods (by class)

- `bininfo(tidyvpcobj)`: Method for `tidyvpcobj`.

---

**binless**  
*Perform binless Visual Predictive Check (VPC)*

**Description**

Use this function in place of traditional binning methods to derive VPC. For continuous VPC, this is obtained using additive quantile regression (`quantreg::rqss()`) and LOESS for pcVPC. While for categorical VPC, this is obtained using a generalized additive model (`gam(family = "binomial")`).
Usage

```r
binless(o, ...)
```

```r
## S3 method for class 'tidyvpcobj'
binless(
  o,
  optimize = TRUE,
  optimization.interval = c(0, 7),
  loess.ypc = NULL,
  lambda = NULL,
  span = NULL,
  sp = NULL,
  ...
)
```

Arguments

- `o`: A `tidyvpcobj`.
- `...`: Other arguments to include will be ignored.
- `optimize`: Logical indicating whether smoothing parameters should be optimized using AIC.
- `optimization.interval`: Numeric vector of length 2 specifying the min/max range of smoothing parameter for optimization. Only applicable if `optimize = TRUE`.
- `loess.ypc`: (Deprecated) Argument is ignored. For a LOESS pcVPC using the ‘binless’ method, usage of `predcorrect` will automatically perform LOESS prediction correction.
- `lambda`: Numeric vector of length 3 specifying lambda values for each quantile. If stratified, specify a `data.frame` with given strata represented the column name, and value specified as a numeric vector of length 3. See below examples. Only applicable to continuous VPC with `optimize = FALSE`.
- `span`: Numeric between 0,1 specifying smoothing parameter for LOESS prediction correction. Only applicable for continuous VPC with `optimize = FALSE` and usage of `predcorrect`.
- `sp`: List of smoothing parameters applied to `mgcv::gam()`. Elements of list must be in the same order as unique values of DV. If one or more stratification variables present, the order of `sp` should be specified as unique combination of strata + DV, in ascending order. See below examples. Only applicable for categorical VPC, if `optimize = FALSE`.

Value

For continuous VPC, updates `tidyvpcobj` with additive quantile regression fits for observed and simulated data for quantiles specified in the `qpred` argument of `vpcstats()`. If the `optimize = TRUE` argument is specified, the resulting `tidyvpcobj` will contain optimized lambda values according to AIC. For prediction corrected VPC (pcVPC), specifying `loess.ypc = TRUE` will return optimized span value for LOESS smoothing. For categorical VPC, updates `tidyvpcobj` with fits.
obtained by `gam(family="binomial")` for observed and simulated data for each category of DV (in each stratum if `stratify` defined). If `optimize = TRUE` argument is specified, the resulting `tidyvpcobj` will contain optimized `sp` values according to AIC.

**See Also**

`binless` obtained by `gam(family="binomial")` for observed and simulated data for each category of DV (in each stratum if `stratify` defined). If `optimize = TRUE` argument is specified, the resulting `tidyvpcobj` will contain optimized `sp` values according to AIC.

**Examples**

```r
require(magrittr)
require(data.table)
obs_data <- obs_data[MDV == 0]
sim_data <- sim_data[MDV == 0]

vpc <- observed(obs_data, y = DV, x = TIME) %>%
  simulated(sim_data, y = DV) %>%
  binless() %>%
  vpcstats()

# Binless example with LOESS prediction correction
obs_data$PRED <- sim_data[REP == 1, PRED]

vpc <- observed(obs_data, y = DV, x = TIME) %>%
  simulated(sim_data, y = DV) %>%
  binless(optimize = TRUE) %>%
  predcorrect(pred = PRED) %>%
  vpcstats()

# Binless example with user specified lambda values stratified on
# "GENDER" with 2 levels ("M", "F"), 10%, 50%, 90% quantiles.

lambda_strat <- data.table(
  GENDER_M = c(3,5,2),
  GENDER_F = c(1,3,4)
)

vpc <- observed(obs_data, y = DV, x = TIME) %>%
  simulated(sim_data, y = DV) %>%
  stratify(~ GENDER) %>%
  binless(optimize = FALSE, lambda = lambda_strat) %>%
  vpcstats(apred = c(0.1, 0.5, 0.9))

# Binless example for categorical DV with optimized smoothing
vpc <- observed(obs_cat_data, x = agemonths, yobs = zlencat) %>%
  simulated(sim_cat_data, ysim = DV) %>%
  stratify(~ Country_ID_code) %>%
```
binless() %>%
vpcstats(vpc.type = "cat", quantile.type = 6)

# Binless example for categorical DV with user specified sp values
user_sp <- list(
  Country1_prob0 = 100,
  Country1_prob1 = 3,
  Country1_prob2 = 4,
  Country2_prob0 = 90,
  Country2_prob1 = 3,
  Country2_prob2 = 4,
  Country3_prob0 = 55,
  Country3_prob1 = 3,
  Country3_prob2 = 200)

vpc <- observed(obs_cat_data, x = agemonths, yobs = zlencat) %>%
simulated(sim_cat_data, ysim = DV) %>%
stratify(~ Country_ID_code) %>%
binless(optimize = FALSE, sp = user_sp) %>%
vpcstats(vpc.type = "categorical", conf.level = 0.9, quantile.type = 6)

---

**binning**

**Binning methods for Visual Predictive Check (VPC)**

**Description**

This function executes binning methods available in classInt i.e. "jenks", "kmeans", "sd", "pretty", "pam", "kmeans", "hclust", "bclust", "fisher", "dpih", "box", "headtails", and "maximum". You may also bin directly on x-variable or alternatively specify "centers" or "breaks". For explanation of binning methods see classIntervals.

**Usage**

binning(o, ...)

## S3 method for class 'tidyvpcobj'  
binning(
  o,  
  bin,  
  data = o$data,  
  xbin = "xmedian",  
  centers,  
  breaks,  
  nbins,  
  altx,  
  stratum = NULL,  
  by.strata = TRUE,
Arguments

- **o**: A tidyvpcobj.
- **...**: Other arguments to include for classIntervals. See ... usage for style in ?classIntervals.
- **bin**: Character string indicating binning method or unquoted variable name if binning on x-variable.
- **data**: Observed data supplied in observed() function.
- **xbin**: Character string indicating midpoint type for binning.
- **centers**: Numeric vector of centers for binning. Use bin = "centers", if supplying centers.
- **breaks**: Numeric vector of breaks for binning. Use bin = "breaks", if supplying breaks.
- **nbins**: Numeric number indicating the number of bins to use.
- **altx**: Unquoted variable name in observed data for alternative x-variable binning.
- **stratum**: List indicating the name of stratification variable and level, if using different binning methods by strata.
- **by.strata**: Logical indicating whether binning should be performed by strata.

Value

Updates tidyvpcobj with data.frame containing bin information including left/right boundaries and midpoint, as specified in xbin argument.

See Also

- observed
- simulated
- censoring
- predcorrect
- stratify
- binless
- vpcstats

Examples

```r
require(magrittr)

# Binning on x-variable NTIME
vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  binning(bin = NTIME) %>%
  vpcstats()

# Binning using ntile and xmean for midpoint
vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  binning(bin = "ntile", nbins = 8, xbin = "xmean") %>%
  vpcstats()

# Binning using centers
```
vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  binning(bin = "centers", centers = c(1,3,5,7)) %>%
  vpcstats()

# Different Binning for each level of Strata
vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  stratify(~ GENDER) %>%
  binning(stratum = list(GENDER = "M"), bin = "jenks", nbins = 5, by.strata = TRUE) %>%
  binning(stratum = list(GENDER = "F"), bin = "kmeans", nbins = 4, by.strata = TRUE) %>%
  vpcstats()

# Binning Categorical DV using rounded time variable
vpc <- observed(obs_cat_data, x = agemonths, y = zlencat ) %>%
  simulated(sim_cat_data, y = DV) %>%
  binning(bin = round(agemonths, 0)) %>%
  vpcstats(vpc.type = "categorical")

---

**binningfunctions**

*Different functions that perform binning.*

**Description**

Different functions that perform binning.

**Usage**

```r
cut_at(breaks)
```

```r
nearest(centers)
```

```r
bin_by_ntile(nbins)
```

```r
bin_by_eqcut(nbins)
```

```r
bin_by_pam(nbins)
```

```r
bin_by_classInt(style, nbins = NULL)
```

**Arguments**

- **breaks**
  - A numeric vector of values that designate cut points between bins.

- **centers**
  - A numeric vector of values that designate the center of each bin.

- **nbins**
  - The number of bins to split the data into.

- **style**
  - A binning style (see classIntervals for details).
Value

Each of these functions returns a function of a single numeric vector ‘x’ that assigns each value of ‘x’ to a bin.

Examples

```r
x <- c(rnorm(10, 1, 1), rnorm(10, 3, 2), rnorm(20, 5, 3))
centers <- c(1, 3, 5)
nearest(centers)(x)

breaks <- c(2, 4)
cut_at(breaks)(x)

bin_by_eqcut(nbins=4)(x)
bin_by_ntile(nbins=4)(x)

bin_by_pam(nbins=4)(x)
bin_by_classInt("pretty", nbins=4)(x)
```

censoring

<table>
<thead>
<tr>
<th>censoring</th>
<th>Censoring observed data for Visual Predictive Check (VPC)</th>
</tr>
</thead>
</table>

Description

Specify censoring variable or censoring value for VPC.

Usage

```r
censoring(o, ...)
```

## S3 method for class 'tidyvpcobj'
censoring(o, blq, lloq, alq, uloq, data = o$data, ...)

Arguments

- `o` A tidyvpcobj.
- `...` Other arguments to include.
- `blq` blq variable if present in observed data.
- `lloq` Numeric value or numeric variable in data indicating the upper limit of quantification.
- `alq` Logical variable indicating above limit of quantification.
- `uloq` Numeric value or numeric variable in data indicating the upper limit of quantification.
- `data` Observed data supplied in observed() function.
Value

Updates obs data.frame in tidypcobj with censored values for observed data which includes lloq and ulojq specified values for lower/upper limit of quantification. Logicals for blq and alq are returned that indicate whether the DV value lies below/above limit of quantification.

See Also

observed simulated stratify predcorrect binning binless vpcstats

Examples

require(magrittr)

vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  censoring(blq=(DV < 50), lloq=50) %>%
  binning(bin = "pam", nbins = 5) %>%
  vpcstats()

#Using LLOQ variable in data with different values of LLOQ by Study:

obs_data$LLOQ <- obs_data[, ifelse(STUDY == "Study A", 50, 25)]

vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  censoring(blq=(DV < LLOQ), lloq=LLOQ) %>%
  stratify(~ STUDY) %>%
  binning(bin = "kmeans", nbins = 4) %>%
  vpcstats()

check_order

Perform a consistency check on observed and simulated data

Description

This function performs a simple consistency check on an observed and simulated dataset to make sure they are consistent with respect to ordering as required by the other functions used in the VPC calculation.

Usage

check_order(obs, sim, tol = 1e-05)

Arguments

obs, sim A ‘data.frame’ with 2 columns (see Details).
tol A tolerance for comparing time values.
Details

The consistency check is performed by comparing a combination of unique subject identifier (ID) and time. Both data.frame objects must be given with those in positions 1 and 2, respectively.

Value

The number of replicates contained in 'sim'.

See Also

observed, simulated.

Examples

```r
require(data.table)

check_order(obs_data[, .(ID, TIME)], sim_data[, .(ID, TIME)])
```

---

**generics**

*Perform a Visual Predictive Check (VPC) computation*

---

Description

These functions work together to calculate the statistics that are plotted in a VPC. They would typically be chained together using the "pipe" operator (see Examples).

Arguments

- `o` A tidyvpcobj.
- `...` Additional arguments.

---

**nopredcorrect**

*Remove prediction correction for Visual Predictive Check (VPC)*

---

Description

Optional function to use indicating no pred correction for VPC.
Usage

nopredcorrect(o, ...)

## S3 method for class 'tidyvpcobj'
nopredcorrect(o, ...)

Arguments

o A tidyvpcobj.
...

npde

Normalized Prediction Distribution Errors

Description

Normalized Prediction Distribution Errors

Usage

npde(o, ...)

## S3 method for class 'tidyvpcobj'
npde(o, id, data = o$data, smooth = FALSE, ...)

Arguments

o A tidyvpcobj.
...

id A vector of IDs. Used to associate observations (y) that originate from the same individual. Evaluated in the data.frame data.
data A data.frame.
smooth Should a uniform random perturbation be used to smooth the pd/pde values?

References

Examples

```r
require(magrittr)
require(ggplot2)

obs <- obs_data[MDV==0]
sim <- sim_data[MDV==0]

npde <- observed(obs, x=NULL, y=DV) %>%
       simulated(sim, y=DV) %>%
       npde(id=ID)

vpc <- observed(npde$npdeobs, x=epred, y=npde) %>%
       simulated(npde$npdesim, y=npde) %>%
       binning("eqcut", nbins=10) %>%
       vpcstats()

plot(vpc) +
     labs(x="Simulation-based Population Prediction", y="Normalized Prediction Distribution Error")
```

---

### observed

**Specify observed dataset and variables for VPC**

The `observed` function is the first function in the `vpc` piping chain and is used for specifying observed data and variables for VPC. Note: Observed data must not contain missing DV and may require filtering `MDV == 0` before generating VPC.

**Usage**

```r
observed(o, ...)
```

### S3 method for class 'data.frame'

```r
observed(
o,
x,
yobs,
pred = NULL,
blq = NULL,
llq = -Inf,
alq = NULL,
ulq = Inf,
...
)
```
Arguments

- `o`: A data.frame of observation data.
- `...`: Other arguments.
- `x`: Numeric x-variable, typically named TIME.
- `yobs`: Numeric y-variable, typically named DV.
- `pred`: Population prediction variable, typically named PRED.
- `blq`: Logical variable indicating below limit of quantification.
- `lloq`: Number or numeric variable in data indicating the lower limit of quantification.
- `alq`: Logical variable indicating above limit of quantification.
- `uloq`: Number or numeric variable in data indicating the upper limit of quantification.

Value

A tidyvpcobj containing both original data and observed data formatted with x and y variables as specified in function. Resulting data is of class data.frame and data.table.

See Also

simulated censoring stratify predcorrect binning binless vpcstats

Examples

```r
obs_data <- obs_data[MDV == 0]
sim_data <- sim_data[MDV == 0]

vpc <- observed(obs_data, x=TIME, y=DV)
```

---

### obs_cat_data

Example observed data with categorical DV

Description

An observed dataset with 3 levels of categorical DV.

Usage

obs_cat_data

Format

A data frame with 4014 rows and 4 variables:

- **PID_code**: Subject identifier
- **agemonths**: Time
- **zlencat**: Categorical DV with the 3 levels
- **Country_ID_code**: Country code for stratification
Source

Certara University

---

(obs_data)

Example observed data with continuous DV

Description

An observed dataset from a hypothetical PK model, altered to include NTIME, GROUP, GENDER.

Usage

(obs_data)

Format

A data.table with 600 rows and 7 variables:

- **ID**  Subject identifier
- **TIME**  Time
- **DV**  Concentration of drug
- **AMT**  Amount of dosage initially administered at DV = 0, TIME = 0
- **DOSE**  Dosage amount
- **MDV**  Dummy indicating missing dependent variable value
- **NTIME**  Nominal Time
- **GENDER**  Character variable indicating subject’s gender ("M", "F")
- **STUDY**  Character variable indicating study type ("Study A", "Study B")

Source

(simple_data)
plot.tidyvpcobj

Plot a tidyvpcobj

Description

Use ggplot2 graphics to plot and customize the appearance of VPC.

Usage

```r
## S3 method for class 'tidyvpcobj'
plot(
  x,
  facet = FALSE,
  show.points = TRUE,
  show.boundaries = TRUE,
  show.stats = !is.null(x$stats),
  show.binning = isFALSE(show.stats),
  xlab = NULL,
  ylab = NULL,
  color = c("red", "blue", "red"),
  linetype = c("dotted", "solid", "dashed"),
  point.alpha = 0.4,
  point.size = 1,
  point.shape = "circle-fill",
  point.stroke = 1,
  ribbon.alpha = 0.1,
  legend.position = "top",
  facet.scales = "free",
  custom.theme = NULL,
  censoring.type = c("none", "both", "blq", "alq"),
  censoring.output = c("grid", "list"),
  ...
)
```

Arguments

- `x`: A tidyvpcobj.
- `facet`: Set to TRUE to facet plot by quantile (continuous VPC) or category (categorical VPC).
- `show.points`: Should the observed data points be plotted?
- `show.boundaries`: Should the bin boundary be displayed?
- `show.stats`: Should the VPC stats be displayed?
- `show.binning`: Should the binning be displayed by coloring the observed data points by bin?
- `xlab`: A character label for the x-axis.
predcorrect

ylab  A character label for the y-axis.
color A character vector of colors for the percentiles, from low to high.
linetype A character vector of line type for the percentiles, from low to high.
point.alpha Numeric value specifying transparency of points.
point.size Numeric value specifying size of point.
point.shape Character one of "circle", "circle-fill", "diamond", "diamond-fill", "square", "square-fill", "triangle-fill", "triangle"). Defaults to "circle-fill".
point.stroke Numeric value specifying size of point stroke.
ribbon.alpha Numeric value specifying size of point stroke.
ribbon.position A character string specifying the position of the legend. Options are "top", "bottom", "left", "right".
facetscales A character string specifying the scales argument to use for faceting. Options are "free", "fixed".
custom.theme A custom ggplot2 theme supplied either as a character string, function, or object of class "theme".
censoring.type A character string specifying additional blq/alq plots to include. Only applicable if censoring was performed.
censoring.output A character string specifying whether to return percentage of blq/alq plots as an arranged "grid" or as elements in a "list". Only applicable if censoring.type != "none".

Value
A ggplot object.

See Also
ggplot

Value
A ggplot object.

Description
Specify prediction variable for pcVPC.

Usage
predcorrect(o, ...)

## S3 method for class 'tidyvpcobj'
predcorrect(o, pred, data = o$data, ..., log = FALSE)
Arguments

- `o` A tidyvpcobj.
- `...` Other arguments to include.
- `pred` Prediction variable in observed data.
- `data` Observed data supplied in observed() function.
- `log` Logical indicating whether DV was modeled in logarithmic scale.

Value

Updates tidyvpcobj with required information to performing prediction correction, which includes the predcor logical indicating whether prediction corrected VPC is to be performed, the predcor.log logical indicating whether the DV is on a log-scale, and the pred prediction column from the original data.

**sim_cat_data**  
Example simulated data with categorical DV

Description

A simulated dataset with the 3 levels of categorical DV across 100 replicates.

Usage

```r
sim_cat_data
```

Format

A data frame with 401400 rows and 4 variables:

- **PID_code**  Subject identifier
- **IVAR**  Time
- **DV**  Categorical DV with 3 levels
- **Replicate**  Replicate num for simulation

Source

Certara University
**Description**

A simulated dataset from a hypothetical PK model with 100 replicates.

**Usage**

```r
sim_data
```

**Format**

A data.table with 60000 rows and 10 variables:

- **ID**: Subject identifier
- **REP**: Replicate num for simulation
- **TIME**: Time
- **DV**: Concentration of drug
- **IPRED**: Individual prediction variable
- **PRED**: Population prediction variable
- **AMT**: Amount of dosage initially administered at DV = 0, TIME = 0
- **DOSE**: Dosage amount
- **MDV**: Dummy indicating missing dependent variable value
- **NTIME**: Nominal Time

**Source**

```r
simple_data
```

**stratify**

*Stratification for Visual Predictive Check (VPC)*

**Description**

Use to specify stratification variables for VPC.

**Usage**

```r
stratify(o, ...)
```

```r
## S3 method for class 'tidyvpcobj'
stratify(o, formula, data = o$data, ...)
```
Arguments

- `tidyvpcobj`: A tidyvpcobj.
- `...`: Other arguments to include.
- `formula`: Formula for stratification.
- `data`: Observed data supplied in observed() function.

Value

Returns updated tidyvpcobj with stratification formula, stratification column(s), and strat.split datasets, which is obs split by unique levels of stratification variable(s). Resulting datasets are of class object data.frame and data.table.

Examples

```r
require(magrittr)

vpc <- observed(obs_data, x=TIME, y=DV) %>%
  simulated(sim_data, y=DV) %>%
  stratify(~ GENDER) %>%
  binning(NTIME) %>%
  vpcstats()

# Example with 2-way stratification by GENDER and STUDY.

vpc <- vpc %>%
  stratify(~ GENDER + STUDY) %>%
  binning(bin = "centers", centers = c(1,3,5,7,10)) %>%
  vpcstats()
```

vpcstats

Compute VPC statistics

Description

Compute prediction interval statistics for VPC.
vpcstats

Usage

vpcstats(o, ...)

## S3 method for class 'tidyvpcobj'
vpcstats(
o,
vpc.type = c("continuous", "categorical"),
qpred = c(0.05, 0.5, 0.95),
..., conf.level = 0.95,
quantile.type = 7
)

Arguments

- **o**: A tidyvpcobj.
- **...**: Other arguments to include.
- **vpc.type**: Character specifying type of VPC (e.g., "continuous" (Default) or "categorical").
- **qpred**: Numeric vector of length 3 specifying quantile prediction interval. Only applicable for vpc.type = "continuous".
- **conf.level**: Numeric specifying confidence level.
- **quantile.type**: Numeric indicating quantile type. See *quantile*.

Value

Updates tidyvpcobj with stats data.table object, which contains the following columns:

- **bin**: Resulting bin value as specified in binning() function
- **xbin**: Midpoint x-value of the observed data points in the bin as specified in xbin argument of binning() function
- **qname**: Quantiles specified in qpred. Only returned if vpc.type = "continuous"
- **pname**: Categorical probability names. Only returned if vpc.type = "categorical"
- **y**: Observed y value for the specified quantile
- **lo**: Lower bound of specified confidence interval for y value in simulated data
- **md**: Median y value in simulated data
- **hi**: Upper bound of specified confidence interval for y value in simulated data
