Type   Package
Title  Diagnostics for Pharmacometric Models
Version 0.4.7
Description Diagnostics for non-linear mixed-effects (population) models from 'NONMEM' <http://www.iconplc.com/innovation/nonmem/>. 'xpose' facilitates data import, creation of numerical run summary and provide 'ggplot2'-based graphics for data exploration and model diagnostics.
Depends R (>= 3.3.0), ggplot2 (>= 3.1.0)
Imports dplyr (>= 0.8.0), ggforce (>= 0.2.0), grDevices, purrr (>= 0.3.0), readr (>= 1.3.0), rlang (>= 0.3.0), stringr (>= 1.4.0), tibble (>= 2.1.0), tidyr (>= 0.8.0), utils, stats, vpc (>= 1.1.0)
Suggests here, gridExtra, markdown, knitr, testthat, plotly, webshot, mvtnorm

amt_vs_idv

Compartment kinetics

Description
Plot of the change in compartment amounts over the independent variable

Usage
amt_vs_idv(
  xpdb,
  mapping = NULL,
  group = "ID",
  drop_fixed = TRUE,
  type = "l",
  title = "Compartment amount vs. @x | @run",
  subtitle = "Ofv: @ofv",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  facets,
  .problem,
  quiet,
  ...
)

Arguments
- xpdb: An xpose database object.
- mapping: List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
- group: Grouping variable to be used for lines.
- drop_fixed: Should columns that only have a single unique value (i.e. fixed) be dropped.
- type: String setting the type of plot to be used. Can be points ’p’, line ’l’, smooth ’s’ and text ’t’ or any combination of the four.
- title: Plot title. Use NULL to remove.
- subtitle: Plot subtitle. Use NULL to remove.
- caption: Page caption. Use NULL to remove.
- tag: Plot identification tag. Use NULL to remove.
- log: String assigning logarithmic scale to axes, can be either ’x’, ’y’ or ’xy’.
- facets: Either a character string to use facet_wrap paginate or a formula to use facet_grid paginate.
- .problem: The $problem number to be used. By default returns the last estimation problem.
- quiet: Logical, if FALSE messages are printed to the console.
- ...: Any additional aesthetics to be passed on xplot_scatter.
Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is `layer_option` where `layer` is one of the names defined in the list below and `option` is any option supported by this layer e.g. `point_color = 'blue'`, `smooth_method = 'lm'`, etc.

- `point`: options to `geom_point`
- `line`: options to `geom_line`
- `guide`: options to `geom_abline`
- `smooth`: options to `geom_smooth`
- `text`: options to `geom_text`
- `xscale`: options to `scale_x_continuous` or `scale_x_log10`
- `yscale`: options to `scale_y_continuous` or `scale_y_log10`

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the `facets` argument is a character string (e.g. `facets = c('SEX', 'MED1')`) or `facet_grid_paginate` when `facets` is a formula (e.g. `facets = SEX ~ MED1`). All xpose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk, facets = SEX + MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both')`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')`) or assigned globally to an xpdb object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. `eta_distrib()`.

When using the `facets` argument, ‘variable’ needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the `facets` argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables starting with a ‘@’ (e.g. ‘@ofv’) which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under `template_titles`.

Examples

`amt_vs_idv(xpdb_ex_pk)`
Create options for data import

Description

Provide a list of options to the general plotting functions such as `xplot_scatter` in order to create appropriate data input for `ggplot2`.

Usage

```r
data_opt(
  .problem = NULL,
  .subprob = NULL,
  .method = NULL,
  .source = "data",
  simtab = FALSE,
  filter = NULL,
  tidy = FALSE,
  index_col = NULL,
  value_col = NULL,
  post_processing = NULL
)
```

Arguments

- `.problem` The problem to be used, by default returns the last one.
- `.subprob` The subproblem to be used, by default returns the last one.
- `.method` The estimation method to be used, by default returns the last one.
- `.source` Define the location of the data in the `xpdb`. Should be either `"data"` to use the output tables or the name of an output file attached to the `xpdb`.
- `simtab` Only used when `"data"` is defined as the source and `.problem` is default. Should the data be coming from an estimation or a simulation table.
- `filter` A function used to filter the data e.g. `filter = function(x) x$x$TIME > 20, ]` where `x` is the data.
- `tidy` Logical, whether the data should be transformed to tidy data.
- `index_col` Only used when `"tidy"` is defined a `TRUE` and `value_col` is `NULL`. Column names to use as index when tidying the data.
- `value_col` Only used when `"tidy"` is defined a `TRUE` and `index_col` is `NULL`. Column names to be stacked when tidying the data.
- `post_processing` A function used to modify the data after it has been tidied up e.g. `post_processing = function(x) dplyr::mutate(.data = x, variable = as.factor(.variable))` where `x` is the tidy data.

Examples

data_opt(.problem = 1, .source = 'data', simtab = TRUE)

prm_distrib(xpdb, mapping = NULL, drop_fixed = TRUE, type = "hr", title = "Parameter distribution | @run", subtitle = "Based on @nind individuals", caption = "@dir", tag = NULL, log = NULL, guide = FALSE, facets, .problem, quiet, ...)

eta_distrib(xpdb, mapping = NULL, drop_fixed = TRUE, type = "hr", title = "Eta distribution | @run", subtitle = "Based on @nind individuals, Eta shrink: @etashk", caption = "@dir", tag = NULL, log = NULL, guide = FALSE, facets, .problem, quiet, ...)
distrib_plot

quiet,
...
)

res_distrib(
xpdb,
mapping = NULL,
res = "CWRES",
type = "hr",
title = "@x distribution | @run",
subtitle = "Based on @nobs observations",
caption = "@dir",
tag = NULL,
log = NULL,
guide = FALSE,
facets,
.problem,
quiet,
...
)

cov_distrib(
xpdb,
mapping = NULL,
drop_fixed = TRUE,
type = "hr",
title = "Continuous covariates distribution | @run",
subtitle = "Based on @nind individuals",
caption = "@dir",
tag = NULL,
log = NULL,
guide = FALSE,
facets,
.problem,
quiet,
...
)

Arguments

xpdb An xpose database object.
mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
drop_fixed Should columns that only have a single unique value (i.e. fixed) be dropped.
type String setting the type of plot to be used. Can be histogram 'h', density 'd', rug 'r' or any combination of the three.
title Plot title. Use NULL to remove.
subtitle Plot subtitle. Use NULL to remove.
Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. histogram_fill = 'blue', rug_sides = 'b', etc.

- histogram: options to geom_histogram
- density: options to geom_density
- rug: options to geom_rug
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c('SEX','MED1')) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1).

All xpose plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk,facets = SEX+MED1,ncol = 3,nrow = 3,page = 1,margins = TRUE,labeller = 'label_both').

Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk,facets = 'SEX')) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk,xp_theme = list(facets = 'SEX'))). In the latter example all plots generate from this xpdb will automatically be stratified by 'SEX'.

By default, some plot functions use a custom stratifying variable named 'variable', e.g. eta_distrib(). When using the facets argument, 'variable' needs to be added manually e.g. facets = c('SEX', 'variable') or Facets = c('SEX', 'variable'), but is optional, when using the facets argument in xp_theme variable is automatically added whenever needed.
Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables starting with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'. The available key variables are listed under template_titles.

Examples

# Histogram of parameters
prm_distrib(xpdb_ex_pk, type = 'h')

# Density plot of etas with a rug
eta_distrib(xpdb_ex_pk, type = 'dr')

# Histogram of different residuals
res_distrib(xpdb_ex_pk, type = 'hr', res = c('IWRES', 'CWRES'))

# Density plot of continuous covariates
cov_distrib(xpdb_ex_pk, type = 'd')

dv_vs_pred  Observations plotted against model predictions

Description

Plot of observations (DV) vs population predictions (PRED), individual predictions (IPRED) or conditional population predictions (CPRED).

Usage

dv_vs_ipred(
  xpdb,
  mapping = NULL,
  group = "ID",
  type = "pls",
  title = "@y vs. @x | @run",
  subtitle = "Ofv: @ofv, Eps shrink: @epsshk",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  facets,
  .problem,
Arguments

**xpdb**
An xpose database object.

**mapping**
List of aesthetics mappings to be used for the xpose plot (e.g. point_color).

**group**
Grouping variable to be used for lines.

**type**
String setting the type of plot to be used. Can be points 'p', line 'l', smooth 's' and text 't' or any combination of the four.

**title**
Plot title. Use NULL to remove.

**subtitle**
Plot subtitle. Use NULL to remove.

**caption**
Page caption. Use NULL to remove.

**tag**
Plot identification tag. Use NULL to remove.

**log**
String assigning logarithmic scale to axes, can be either '', 'x', 'y' or 'xy'.

**guide**
Enable guide display (e.g. unity line).

**facets**
Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.

**.problem**
The $problem number to be used. By default returns the last estimation problem.

**quiet**
Logical, if FALSE messages are printed to the console.

... Any additional aesthetics to be passed on xplot_scatter.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.
• point: options to `geom_point`
• line: options to `geom_line`
• guide: options to `geom_abline`
• smooth: options to `geom_smooth`
• text: options to `geom_text`
• xscale: options to `scale_x_continuous` or `scale_x_log10`
• yscale: options to `scale_y_continuous` or `scale_y_log10`

Faceting

Every `xp`ose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the `facets` argument is a character string (e.g. `facets = c('SEX', 'MED1')`) or `facet_grid_paginate` when `facets` is a formula (e.g. `facets = SEX ~ MED1`). All `xp`ose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk, facets = SEX ~ MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both')`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')`) or assigned globally to an `xp`db object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this `xp`db will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. `eta_distrib()`.
When using the `facets` argument, ‘variable’ needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the `facets` argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a ‘@’ (e.g. ‘@ofv’) which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under `template_titles`.

See Also

`xplot_scatter`

Examples

`dv_vs_pred(xpdb_ex_pk)`
`dv_vs_ipred(xpdb_ex_pk)`
**get_code**

*Access model code*

**Description**

Access model code from an xpdb object.

**Usage**

```r
get_code(xpdb, .problem = NULL)
```

**Arguments**

- `xpdb`: An `xpose_data` object from which the model code will be extracted.
- `.problem`: The problem to be used, in addition, problem 0 is attributed to general output (e.g. NM-TRAN warnings in NONMEM). By default returns the entire code.

**Value**

A tibble of the parsed model.

**See Also**

`xpose_data`, `read_nm_model`

**Examples**

```r
parsed_model <- get_code(xpdb_ex_pk)
parsed_model
```

---

**get_data**

*Access model output table data*

**Description**

Access model output table data from an xpdb object.

**Usage**

```r
get_data(xpdb, table = NULL, .problem = NULL, quiet)
```

**Examples**

```r
parsed_model <- get_data(xpdb_ex_pk)
parsed_model
```
get_file

Arguments

xpdb An xpose_data object from which the model output file data will be extracted.
table Name of the output table to be extracted from the xpdb e.g. 'sdtab001'. Alternative to the '.problem' argument.
.problem Accesses all tables from the specified problem. Alternative to the 'table' argument.
quiet Logical, if FALSE messages are printed to the console.

Value

By default returns data from the last estimation problem. If only simulation problems are present then the data from last simulation will be returned instead. Object returned as tibble for single tables/problems or a named list for multiple tables/problems.

See Also

list_data, xpose_data, read_nm_tables

Examples

# By table name
sdtab <- get_data(xpdb_ex_pk, 'sdtab001')
sdtab

# By problem
tables <- get_data(xpdb_ex_pk, .problem = 1)
tables

# Tip to list available tables in the xpdb
print(xpdb_ex_pk)
get prm

Description

Access model parameter estimates from an xpdb object.

Arguments

- **xpdb**
  An xpose_data object from which the model output file data will be extracted.

- **file**
  Full name of the file to be extracted from the xpdb e.g. 'run001.phi'. Alternative to the 'ext' argument.

- **ext**
  Extension of the file to be extracted from the xpdb e.g. 'phi'. Alternative to the 'file' argument.

- **.problem**
  The problem to be used, by default returns the last one for each file.

- **.subprob**
  The subproblem to be used, by default returns the last one for each file.

- **.method**
  The estimation method to be used (e.g. 'foce', 'imp', 'saem'), by default returns the last one for each file.

- **quiet**
  Logical, if FALSE messages are printed to the console.

Value

A tibble for single file or a named list for multiple files.

See Also

- list_files
- xpose_data
- read_nm_files

Examples

# Single file (returns a tibble)
ext_file <- get_file(xpdb_ex_pk, file = 'run001.ext')
ext_file

# Multiple files (returns a list)
files <- get_file(xpdb_ex_pk, file = c('run001.ext', 'run001.phi'))
files

# Tip to list available files in the xpdb
print(xpdb_ex_pk)
Usage

get_prm(
  xpdb,
  .problem = NULL,
  .subprob = NULL,
  .method = NULL,
  digits = 4,
  transform = TRUE,
  show_all = FALSE,
  quiet
)

Arguments

xpdb An xpose_data object from which the model output file data will be extracted.

.problem The problem to be used, by default returns the last one for each file.

.subprob The subproblem to be used, by default returns the last one for each file.

.method The estimation method to be used, by default returns the last one for each file

digits The number of significant digits to be displayed.

.transform Should diagonal OMEGA and SIGMA elements be transformed to standard deviation and off diagonal elements be transformed to correlations.

.show_all Logical, whether the 0 fixed off-diagonal elements should be removed from the output.

.quiet Logical, if FALSE messages are printed to the console.

Value

A tibble for single problem/subprob or a named list for multiple problem/subprob.

See Also

prm_table

Examples

# Store the parameter table
prm <- get_prm(xpdb_ex_pk, .problem = 1)

# Display parameters to the console
prm_table(xpdb_ex_pk, .problem = 1)
get_special

**Description**

Access special model data from an xpdb object.

**Usage**

```r
get_special(xpdb, .problem = NULL, quiet)
```

**Arguments**

- `xpdb`: An `xpose_data` object from which the special data will be extracted.
- `.problem`: The problem to be used, by default returns the last one.
- `quiet`: Logical, if FALSE messages are printed to the console.

**Value**

A list.

**See Also**

`list_special`, `xpose_data`

**Examples**

```r
special <- get_summary(xpdb_exPk)
special
```

get_summary

**Description**

Access model summary data from an xpdb object.

**Usage**

```r
get_summary(xpdb, .problem = NULL, .subprob = NULL, only_last = FALSE)
```
Arguments

- **xpdb**: An xpose_data object from which the summary data will be extracted.
- **.problem**: The .problem to be used, by default returns the last one for each label.
- **.subprob**: The subproblem to be used, by default returns the last one for each label.
- **only_last**: Logical, if TRUE only the last record for each label is returned in case of multiple problem and/or subproblem. If FALSE all values are returned.

Value

A tibble of model summary.

See Also

xpose_data, template_titles, summary.xpose_data

Examples

```r
run_summary <- get_summary(xpdb_ex_pk)
run_summary
```

---

**gg_themes**

An additional set of themes for ggplot2

Description

An additional set of complete ggplot2 themes intended to make ggplot2 more readable when used in presentation or publications. These themes also bring the legend_position option without having to call the ggplot2 theme() function to modify a complete theme.

- **theme_bw2**: Black and white theme inspired by a theme from Gunnar Yngman.
- **theme_readable**: Light grey theme, with dimmed background and grid lines intended to bring the focus on the data.

Usage

```r
theme_bw2(base_size = 11, base_family = "", legend_position = "right")
theme_readable(base_size = 11, base_family = "", legend_position = "right")
```

Arguments

- **base_size**: Base font size.
- **base_family**: Base font family.
- **legend_position**: The position of legends defined as 'none', 'left', 'right', 'bottom', 'top', or a two-element numeric vector.
Examples

# With the gg_theme theme_readable() (default)
dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')

# With the gg_theme theme_bw2()
xdpb_ex_pk %>%
  update_themes(gg_theme = theme_bw2()) %>%
dv_vs_ipred(facets = 'SEX')

ind_plots  Observations, individual predictions and population predictions plotted against the independent variable for every individual

Description

Observations (DV), individual predictions (IPRED) and population predictions (PRED) plotted against the independent variable for every individual

Usage

ind_plots(
  xpdb,
  mapping = NULL,
  group = "variable",
  type = "lp",
  title = "Individual plots | @run",
  subtitle = "Ofv: @ofv, Eps shrink: @epsshk",
  caption = "@dir | Page @page of @lastpage",
  tag = NULL,
  log = NULL,
  facets,
  .problem,
  quiet,
  color = c("grey60", "deepskyblue4", "deepskyblue3"),
  point_alpha = c(0.8, 0, 0),
  line_linetype = c("blank", "solid", "55"),
  ...
)

Arguments

xpdb An xpose database object.

mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).

group Grouping variable to be used for lines.

type String setting the type of plot to be used. Can be points ’p’, line ’l’, smooth ’s’ and text ’t’ or any combination of the four.
title                  | Plot title. Use NULL to remove.
subtitle               | Plot subtitle. Use NULL to remove.
caption                | Page caption. Use NULL to remove.
tag                   | Plot identification tag. Use NULL to remove.
log                    | String assigning logarithmic scale to axes, can be either ”', 'x', y' or 'xy'.
facets                 | Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.
.problem               | The $problem number to be used. By default returns the last estimation problem.
quiet                  | Logical, if FALSE messages are printed to the console.
color                  | Changes the **lines, points and text** color. Should be a vector of 3 values (i.e. DV, IPRED, PRED). This color argument is a special case in xpose as it applies to three different layers (geom_line, geom_point and geom_text). This special case is due to the fact that in ggplot2 it is not possible to have two different color scales for different layers.
point_alpha            | Points alpha, should be a vector of 3 values (i.e. DV, IPRED, PRED).
line_linetype          | Lines linetype, should be a vector of 3 values (i.e. DV, IPRED, PRED).
...                    | Any additional aesthetics to be passed on xplot_scatter.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.

- point: options to geom_point
- line: options to geom_line
- guide: options to geom_abline
- smooth: options to geom_smooth
- text: options to geom_text
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c('SEX', 'MED1')) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1). All xpose plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk, facets = SEX~MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both').

Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))). In the latter example all plots generate from this xpdb will automatically be stratified by 'SEX'.
By default, some plot functions use a custom stratifying variable named 'variable', e.g. `eta_distrib()`. When using the `facets` argument, 'variable' needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the `facets` argument in `xp_theme` variable is automatically added whenever needed.

**Template titles**

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'. The available key variables are listed under `template_titles`.

**See Also**

`xplot_scatter`

**Examples**

# Basic example
def ind_plots(xpdb_ex_pk, page = 1, ncol = 3, nrow = 3)

---

### irep

**Add simulation counter**

**Description**

Add a column containing a simulation counter (irep). A new simulation is counted everytime a value in x is lower than its previous value.

**Usage**

`irep(x, quiet = FALSE)`

**Arguments**

- `x`: The column to be used for computing simulation number, usually the ID column.
- `quiet`: Logical, if FALSE messages are printed to the console.

**Examples**

```r
xpdb_ex_pk_2 <- xpdb_ex_pk %>%
  mutate(sim_id = irep(ID), .problem = 2)
```
### list_nm_tables

**List NONMEM output tables**

**Description**

List NONMEM output tables file names from a `nm_model` object.

**Usage**

```r
list_nm_tables(nm_model = NULL)
```

**Arguments**

- `nm_model`: An `xpose nm_model` object generated with `read_nm_model`.

**See Also**

`read_nm_model, read_nm_tables`

**Examples**

```r
## Not run:
read_nm_model(file = '/quotesingle.Var run001.lst'/quotesingle.Var)
%>%
  list_nm_tables()
## End(Not run)
```

### list_vars

**List available variables**

**Description**

Function listing all available variables in an `xpdb` object.

**Usage**

```r
list_vars(xpdb, .problem = NULL)
```

**Arguments**

- `xpdb`: An `xpose_data` object from which the model code will be extracted.
- `.problem`: The problem to be used, by lists all available problems.

**See Also**

`set_var_types`
Examples

list_vars(xpdb_ex_pk)

---

list_xpdb  List available datasets

Description

Function providing a detailed listing of all available datasets in an xpdb object.

Usage

list_data(xpdb)
list_files(xpdb)
list_special(xpdb)

Arguments

xpdb  An xpose_data object to be evaluated

See Also

get_data, get_file, get_special

Examples

# List output tables data
list_data(xpdb_ex_pk)

# List output files data
list_files(xpdb_ex_pk)

# List special data
xpdb_ex_pk %>%
  vpc_data(quiet = TRUE) %>%
  list_special()
### manual_nm_import

*Manually define nonmem tables to be imported*

**Description**

Manually provide names of the table files to be imported by `xpose_data`.

**Usage**

```r
manual_nm_import(
  tab_names = c("sdtab", "mutab", "patab", "catab", "cotab", "mytab", "extra", "xptab", "cwtab"),
  tab_suffix = "",
  sim_suffix = "sim"
)
```

**Arguments**

- `tab_names`: Provide the name of the tables to import e.g. 'sdtab', 'patab', 'cotab', 'catab' for NONMEM.
- `tab_suffix`: Default is '', but can be changed to any character string to be used as suffix in the table names.
- `sim_suffix`: Default is 'sim', but can be changed to any character string to be used as suffix in the simulation table names e.g. sdtab001sim.

**Details**

In order to be imported manually, table names must follow the following convention: `<tab_names><runno><tab/sim_suffix>`, e.g. sdtab001sim. When the argument 'file' is used in `xpose_data`, the `<runno>` part is guessed by taking the portion of the string starting by any digit and ending at the file extension e.g. file = `run001a.mod` will guess `<runno>` as '001a'. If no valid `<runno>` can be guessed, xpose will return an error. In this case it is advised to use the `xpose_data` argument 'runno' directly rather than 'file' hence preventing xpose from having to guess `<runno>`.

Note that with manual table import xpose still reads in the NONMEM model file in order to generate the run summary.

**See Also**

`xpose_data`

**Examples**

```r
## Not run:
# Import all names specified by default as in xpose4
xpose_data(runno = "001", manual_import = manual_nm_import())

# Import a specific table name
```
minimization_plots

Parameter value or gradient vs. iterations

Description

Change of parameter value or gradient vs. iterations.

Usage

```r
prm_vs_iteration(
  xpdb,
  mapping = NULL,
  group = "variable",
  type = "l",
  title = "Parameter \( y \) vs. \( x \) | \text{run}\),
  subtitle = "Method: @method, minimization time: @runtime\nTermination message: @term",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = FALSE,
  facets,
  .problem,
  .subprob,
  .method,
  quiet,
  ...
)
```

```r
grd_vs_iteration(
  xpdb,
  mapping = NULL,
  group = "variable",
  type = "l",
  title = "Gradient \( y \) vs. \( x \) | \text{run}\),
  subtitle = "Method: @method, minimization time: @runtime\nTermination message: @term",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = FALSE,
  facets,
  .problem,
  .subprob,
  .method,
...)```
minimization_plots

quiet, 
...
)

Arguments

xpdb An xpose database object.
mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
group Grouping variable to be used for lines.
type String setting the type of plot to be used. Can be points 'p', line 'l', smooth 's' and text 't' or any combination of the four.
title Plot title. Use NULL to remove.
subtitle Plot subtitle. Use NULL to remove.
caption Page caption. Use NULL to remove.
tag Plot identification tag. Use NULL to remove.
log String assigning logarithmic scale to axes, can be either '', 'x', y' or 'xy'.
guide Enable guide display (e.g. unity line).
facets Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.
.problem The $problem number to be used. By default returns the last estimation problem.
.subprob The sub-problem number to be used. By default returns the last sub-problem associated with the selected problem.
.method The estimation method to be used, by default returns the last one for each file
quiet Logical, if FALSE messages are printed to the console.
... Any additional aesthetics to be passed on xplot_scatter.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.

- point: options to geom_point
- line: options to geom_line
- guide: options to geom_abline
- smooth: options to geom_smooth
- text: options to geom_text
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10
Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the facets argument is a character string (e.g. `facets = c('SEX', 'MED1')`) or `facet_grid_paginate` when facets is a formula (e.g. `facets = SEX~MED1`). All xpose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk, facets = SEX~MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both')`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')`) or assigned globally to an xpdb object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. `eta_distrib()`. When using the facets argument, ‘variable’ needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the facets argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under `template_titles`.

---

**modify_xpdb**

Add, remove or rename variables in an xpdb

**Description**

`mutate()` adds new variables and preserves existing ones. `select()` keeps only the listed variables; `rename()` keeps all variables.
Usage

## S3 method for class 'xpose_data'
mutate(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
select(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
rename(.data, ..., .problem, .source, .where)

Arguments

.data  An xpose database object.

...  Name-value pairs of expressions. Use NULL to drop a variable.

These arguments are automatically quoted and evaluated in the context of the data frame. They support unquoting and splicing. See the dplyr vignette("programming") for an introduction to these concepts.

.problem  The problem from which the data will be modified

.source  The source of the data in the xpdb. Can either be 'data' or an output file extension e.g. 'phi'.

.where  A vector of element names to be edited in special (e.g. .where = c('vpc_dat','aggr_obs')) with vpc).

Examples

# Mutate columns
xpdb_ex_pk %>%
  mutate(lnDV = log(DV),
         sim_count = irep(ID),
         .problem = 1) %>%
dv_vs_idv(aes(y = lnDV))

# Rename/select columns
xpdb_ex_pk %>%
  select(ID:TAD, DV, EVID) %>%
  rename(TSLD = TAD) %>%
dv_vs_idv(aes(x = TSLD))

pred_vs_idv  Observations and model predictions plotted against the independent variable

Description

Plot of observations (DV), individual model predictions (IPRED) and/or population predictions (PRED) plotted against the independent variable (IDV).
Usage

dv_vs_idv(
    xpdb,
    mapping = NULL,
    group = "ID",
    type = "pls",
    title = "@y vs. @x | @run",
    subtitle = "Ofv: @ofv",
    caption = "@dir",
    tag = NULL,
    log = NULL,
    facets,
    .problem,
    quiet,
    ...
)

ipred_vs_idv(
    xpdb,
    mapping = NULL,
    group = "ID",
    type = "pls",
    facets,
    title = "@y vs. @x | @run",
    subtitle = "Ofv: @ofv, Eps shrink: @epsshk",
    caption = "@dir",
    tag = NULL,
    log = NULL,
    .problem,
    quiet,
    ...
)

pred_vs_idv(
    xpdb,
    mapping = NULL,
    group = "ID",
    type = "pls",
    facets,
    title = "@y vs. @x | @run",
    subtitle = "Ofv: @ofv",
    caption = "@dir",
    tag = NULL,
    log = NULL,
    .problem,
    quiet,
    ...
)
pred_vs_idv

```
dv_preds_vs_idv(
    xpdb,
    mapping = NULL,
    group = "ID",
    type = "pls",
    facets,
    title = "Observations, Individual and Population Predictions vs. @x | @run",
    subtitle = "Ofv: @ofv, Eps shrink: @epsshk",
    caption = "@dir",
    tag = NULL,
    log = NULL,
    .problem,
    quiet,
    ...
)
```

**Arguments**

- `xpdb` An xpose database object.
- `mapping` List of aesthetics mappings to be used for the xpose plot (e.g. `point_color`).
- `group` Grouping variable to be used for lines.
- `type` String setting the type of plot to be used. Can be points 'p', line 'l', smooth 's' and text 't' or any combination of the four.
- `title` Plot title. Use `NULL` to remove.
- `subtitle` Plot subtitle. Use `NULL` to remove.
- `caption` Page caption. Use `NULL` to remove.
- `tag` Plot identification tag. Use `NULL` to remove.
- `log` String assigning logarithmic scale to axes, can be either ", 'x', y' or 'xy'.
- `facets` Either a character string to use `facet_wrap_paginate` or a formula to use `facet_grid_paginate`.
- `problem` The $problem number to be used. By default returns the last estimation problem.
- `quiet` Logical, if `FALSE` messages are printed to the console.
- `...` Any additional aesthetics to be passed on `xplot_scatter`.

**Layers mapping**

Plots can be customized by mapping arguments to specific layers. The naming convention is `layer_option` where layer is one of the names defined in the list below and option is any option supported by this layer e.g. `point_color = 'blue', smooth_method = 'lm', etc.`

- `point`: options to `geom_point`
- `line`: options to `geom_line`
- `guide`: options to `geom_abline`
- `smooth`: options to `geom_smooth`
• text: options to geom_text
• xscale: options to scale_x_continuous or scale_x_log10
• yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c(‘SEX’, ‘MED1’)) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1). All xpose plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk, facets = SEX~MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = ‘label_both’).

Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk, facets = ‘SEX’)) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = ‘SEX’))). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. eta_distrib(). When using the facets argument, ‘variable’ needs to be added manually e.g. facets = c(‘SEX’, ‘variable’) or facets = c(‘SEX’, ‘variable’), but is optional, when using the facets argument in xp_theme variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a ‘@’ (e.g. ‘@ofv’) which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under template_titles.

pred_vs_idv(xpdb_ex_pk)
dv_preds_vs_idv(xpdb_ex_pk)
print.xpose_data

Print an xpose_data object

Description
This function returns to the console a list of the files and options attached to an xpose_data object.

Usage
## S3 method for class 'xpose_data'
print(x, ...)

Arguments
x  An xpose_data object generated with xpose_data.
...
  Ignored in this function

Examples
# Using the print function
print(xpdb_ex_pk)

# Or simply by writing the xpdb name
xpdb_ex_pk

print.xpose_plot

Draw an xpose_plot object

Description
This function explicitly draw an xpose_plot and interprets keywords contained in labels.

Usage
## S3 method for class 'xpose_plot'
print(xpose_plot)
print(x, page, ...)

Arguments
x  An xpose_plot object.
page  The page number to be drawn. Can be specified as vector or range of integer values.
...
  Options to be passed on to the ggplot2 print method.
Examples

```r
my_plot <- dv_vs_ipred(xpdb_ex_pk) +
    labs(title = 'A label with keywords: @nind individuals & @nobs observations')
# Using the print function
print(my_plot)

# Or simply by writting the plot object name
my_plot
```

**prm_table**

Display parameter estimates to the console

**Description**

Display parameter estimates from an xpdb object to the console.

**Usage**

```r
prm_table(
    xpdb,
    .problem = NULL,
    .subprob = NULL,
    .method = NULL,
    digits = 4,
    transform = TRUE,
    show_all = FALSE
)
```

**Arguments**

- `xpdb`  
  An `xpose_data` object from which the model output file data will be extracted.
- `.problem`  
  The problem to be used, by default returns the last one for each file.
- `.subprob`  
  The subproblem to be used, by default returns the last one for each file.
- `.method`  
  The estimation method to be used, by default returns the last one for each file.
- `digits`  
  The number of significant digits to be displayed.
- `transform`  
  Should diagonal OMEGA and SIGMA elements be transformed to standard deviation and off diagonal elements be transformed to correlations.
- `show_all`  
  Logical, whether the 0 fixed off-diagonal elements should be removed from the output.

**See Also**

- `get_prm`,

Examples

# Store the parameter table
prm <- get prm(xpdb_ex_pk, .problem = 1)

# Display parameters to the console
prm_table(xpdb_ex_pk, .problem = 1)

qq_plot

QQ plots of ETA and residuals

Description

QQ plots of the ETA and model residuals.

Usage

prm_qq(
xpdb,  
mapping = NULL,  
drop_fixed = TRUE,  
type = "p",  
title = "QQ plot of parameters | @run",  
subtitle = "Based on @nind individuals",  
caption = "@dir",  
tag = NULL,  
log = NULL,  
guide = TRUE,  
facets,  
.problem,  
quiet,  
...  
)

eta_qq(
xpdb,  
mapping = NULL,  
drop_fixed = TRUE,  
type = "p",  
title = "QQ plot of etas | @run",  
subtitle = "Based on @nind individuals, Eta shrink: @etashk",  
caption = "@dir",  
tag = NULL,  
log = NULL,  
guide = TRUE,  
facets,  
.problem,
qq_plot

quiet, ...
)

res.qq(
  xpdb,
  mapping = NULL,
  res = "CWRES",
  type = "p",
  title = "QQ plot of @sample | @run",
  subtitle = "Based on @nobs observations",
  caption = @dir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  facets,
  .problem,
  quiet,
 ...)

cov.qq(
  xpdb,
  mapping = NULL,
  drop_fixed = TRUE,
  type = "p",
  title = "QQ plot of continuous covariates | @run",
  subtitle = "Based on @nind individuals",
  caption = @dir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  facets,
  .problem,
  quiet,
 ...)

Arguments

  xpdb   An xpose database object.
  mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
  drop_fixed Should columns that only have a single unique value (i.e. fixed) be dropped.
  type String setting the type of plot. Can only be points 'p'.
  title Plot title. Use NULL to remove.
  subtitle Plot subtitle. Use NULL to remove.
  caption Page caption. Use NULL to remove.
tag
  Plot identification tag. Use NULL to remove.
log
  String assigning logarithmic scale to axes, can be either ‘’, ‘x’, ‘y’ or ‘xy’.
guide
  Should the guide (e.g. reference line) be displayed.
facets
  Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.
.problem
  The $problem number to be used. By default returns the last estimation problem.
quiet
  Logical, if FALSE messages are printed to the console.
...
  Any additional aesthetics to be passed on xplot_scatter.
res
  Only used for res_qq. Defines the type of residual to be used. Default is "CWRES".

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', etc.

- point: options to geom_point
- guide: options to geom_abline
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c('SEX','MED1')) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1). All xpose plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk,facets = SEX~MED1,ncol = 3,nrow = 3,page = 1,margins = TRUE,labeller = 'label_both'). Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk,facets = 'SEX')) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk,xp_theme = list(facets = 'SEX'))). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. eta_distrib(). When using the facets argument, ‘variable’ needs to be added manually e.g. facets = c('SEX','variable') or facets = c('SEX','variable'), but is optional, when using the facets argument in xp_theme variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a ‘@’ (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'. The available key variables are listed under template_titles.

`xplot_distrib`

Examples

```r
# QQ plot of parameters
prm_qq(xpdb_ex_pk)

# QQ plot of eta
eta_qq(xpdb_ex_pk)

# QQ plot of residuals
res_qq(xpdb_ex_pk, res = c('IWRES', 'CWRES'))

# QQ plot of continuous covariates
cov_qq(xpdb_ex_pk)
```

---

### read_nm_files

**NONMEM output file import function**

#### Description

Quickly import NONMEM output files into R.

#### Usage

```r
read_nm_files(
  runno = NULL,
  prefix = "run",
  ext = c(".ext", ".cor", ".cov", ".phi", ".grd", ".shk"),
  file = NULL,
  dir = NULL,
  quiet = FALSE
)
```

#### Arguments

- **runno**
  - Run number to be evaluated.

- **prefix**
  - Prefix of the model file names.

- **ext**

- **file**
  - Names of the model output file to be imported. Alternative argument to `prefix`, `runno` and `ext`.

- **dir**
  - Location of the model files.

- **quiet**
  - Logical, if FALSE messages are printed to the console.
File path generation

The rules for model file names generation are as follow:

- with runno: the full path is generated as <dir>/<prefix><runno>.<ext> e.g. with dir = 'model/pk', prefix = 'run', runno = '001', ext = '.lst' the resulting path would be model/pk/run001.lst
- with file: the full path is generated as <dir>/<file> e.g. with dir = 'model/pk', file = 'run001.lst' the resulting path would also be model/pk/run001.lst. Note: in this case the file extension should be provided as part of the ‘file’ argument.

See Also

xpose_data, read_nm_tables

Examples

```r
## Not run:
# Using the 'file' argument to import a model file:
ex_file <- read_nm_files(file = 'run001.ext', dir = 'models')

# Using the 'runno' argument to import a model file:
ex_file <- read_nm_files(runno = '001', ext = '.ext', dir = 'models')

## End(Not run)
```

---

**read_nm_model**

**NONMEM model file parser**

**Description**

Parse NONMEM model files in R format

**Usage**

```r
read_nm_model(
  runno = NULL,
  prefix = "run",
  ext = ".lst",
  file = NULL,
  dir = NULL
)
```

**Arguments**

- `runno`: Run number to be used to generate model file name. Used in combination with prefix and ext.
- `prefix`: Prefix to be used to generate model file name. Used in combination with runno and ext.
Extension to be used to generate model file name. Should be one of '.lst' (default), '.out', '.res', '.mod' or '.ctl' for NONMEM.

Model file name (preferably a '.lst' file) containing the file extension. Alternative to prefix, runno and ext arguments.

Location of the model files.

Details

A NONMEM model output file (i.e. .lst, .out or .res) should preferably be provided to `read_nm_model` to allow for a more extensive xpose summary. However in some cases these output files may not contain the model code, thus preventing xpose from identifying the associated output tables names. In such cases xpose will attempt to read the associated model file (i.e. .mod or .ctl) instead to find the model code. Note: it is important that between the naming convention between the NONMEM output and the model file remains consistent e.g. run001.lst should be associated with run001.mod.

Value

A tibble of class model containing the following columns:

- **problem**: a numeric identifier for the $PROBLEM associated with the code.
- **level**: a unique numeric identifier to each subroutine block associated with the code.
- **subroutine**: a character identifier named after the 3 first letters of the subroutine name e.g. 'STHETA' and 'STABLE' will become 'the' and 'tab' respectively. In addition all output from the .lst is labeled 'lst', the general nonmem output e.g. NM-TRAN messages are labelled 'oth'. With priors thp, tpv, omp, opd, sip, spd abbreviations are given to the THETAP, THETAPV, OMEGAP, etc.
- **code**: the code without comments or subroutine names e.g. 'STHETA 0.5 ; TVCL' will return '0.5'.
- **comment**: the last comment of a record e.g. '0.5 ; Clearance (L/h) ; TVCL' will return 'TVCL'.

File Path Generation

The rules for model file names generation are as follow:

- with runno: the full path is generated as `<dir>/<prefix><runno>.<ext>` e.g. with `dir = 'model/pk', prefix = 'run', runno = '001', ext = '.lst'` the resulting path would be `model/pk/run001.lst`
- with file: the full path is generated as `<dir>/<file>` e.g. with `dir = 'model/pk', file = 'run001.lst'` the resulting path would also be `model/pk/run001.lst`. Note: in this case the file extension should be provided as part of the ‘file’ argument.

## Not run:

# Using the `file` argument to import a model file:
```
rm_model <- read_nm_model(file = 'run001.lst', dir = 'models')
```

# Using the `runno` argument to import a model file:
```
rm_model <- read_nm_model(runno = '001', ext = '.lst', dir = 'models')
```

## End(Not run)

---

**read_nm_tables**

*NONMEM output table import function*

### Description

Quickly import NONMEM output tables into R. This function automatically detects the optimal settings to import the tables from nonmem.

### Usage

```
read_nm_tables(
  file = NULL,
  dir = NULL,
  combined = TRUE,
  rm_duplicates = TRUE,
  quiet = FALSE,
  simtab = NULL,
  ziptab = TRUE,
  ...
)
```

### Arguments

- **file**: A character vector of path to the files or a `nm_table_list` object created with `list_nm_tables`.
- **dir**: Location of the model files.
- **combined**: Logical value indicating whether multiple tables should be combined into a single one. If the number of rows does not match an error will be returned.
- **rm_duplicates**: Logical value indicating whether duplicated columns should be removed.
- **quiet**: Logical, if FALSE messages are printed to the console.
- **simtab**: If TRUE only reads in simulation tables, if FALSE only reads estimation tables. Default NULL reads all tables.
- **ziptab**: If TRUE search for the tables that have been compressed and renamed `<file>.zip`.
- **...**: Additional arguments to be passed to the `read_table2` or `read_csv` functions.
res_vs_idv

Residuals plotted against the independent variable

Description

Model residuals plotted against the independent variable (IDV).

The residuals can be one of:

- RES: model residuals
- WRES: weighted model residuals
- CWRES: conditional weighted model residuals
- EWRES/ECWRES: Monte Carlo based model residuals
- NPDE: Normalized prediction distribution error

Table format requirement

When using read_nm_tables with the combined argument set to FALSE an ID column must be present in all data tables. When combined is set to TRUE instead an ID column must be present in at least one table for each problem and for each ‘firstonly’ category. ID columns are required to properly combine/merge tables and removing NA records. If the ID column is missing from a table and combined = FALSE read_nm_tables will return the following warning: Unknown variables: ‘ID’. While the data is returned beware that NA records might be left in the data and the output should be checked carefully. If combined = TRUE read_nm_tables xpose is more strict and will return the following warning instead: Dropped `<tablenames>` due to missing required `ID` column.

Examples

```r
## Not run:
# Import tables manually and return them as a list of individual tables
nm_tables <- read_nm_tables(file = c("sdtab001", "patab001"),
  dir = "models", combined = FALSE)

# Import tables manually and return them as a single merged table
nm_tables <- read_nm_tables(file = c("sdtab001", "patab001"),
  dir = "models", combined = TRUE)

# Import tables automatically (used internally by xpose_data())
nm_tables <- read_nm_model(file = "run001.lst", dir = "models") %>%
  list_nm_tables() %>%
  read_nm_tables()

# Passing arguments to readr via `...`
# (e.g. import columns as character and only first 10 rows)
nm_tables <- read_nm_tables(file = "sdtab001", dir = "models",
  col_type = readr::cols(.default = "c"),
  n_max = 10)

## End(Not run)
```
res_vs_idv

Usage

res_vs_idv(
  xpdb,
  mapping = NULL,
  res = "CWRES",
  group = "ID",
  type = "pls",
  title = "@y vs. @x | @run",
  subtitle = "Ofv: @ofv",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  facets,
  .problem,
  quiet,
  ...
)

absval_res_vs_idv(
  xpdb,
  mapping = NULL,
  res = "CWRES",
  group = "ID",
  type = "pls",
  title = "@y vs. @x | @run",
  subtitle = "Ofv: @ofv",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = FALSE,
  facets,
  .problem,
  quiet,
  ...
)

Arguments

xpdb An xpose database object.
mapping List of aesthetics mappings to use for the xpose plot (e.g. point_color).
res Type of residual to use. Default is "CWRES".
group Grouping variable to use for lines.
type String setting the type of plot to use. Can be points 'p', line 'l', smooth 's' and text 't' or any combination of the four.
title Plot title. Use NULL to remove.
subtitle Plot subtitle. Use NULL to remove.
caption | Page caption. Use NULL to remove.
tag | Plot identification tag. Use NULL to remove.
log | String assigning logarithmic scale to axes, can be either ", 'x', y' or 'xy'.
tag | Enable guide display (e.g. unity line).
facets | Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.
.problem | The $problem number to be used. By default returns the last estimation problem.
quiet | Logical, if FALSE messages are printed to the console.
... | Any additional aesthetics to be passed on xplot_scatter.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.

- point: options to geom_point
- line: options to geom_line
- guide: options to geom_abline
- smooth: options to geom_smooth
- text: options to geom_text
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'. The available key variables are listed under template_titles.

xplot_scatter

Examples

# Standard residual
res_vs_idv(xpdb_ex_pk, res = c('IWRES', 'CWRES'))

# Absolute value of the residuals
absval_res_vs_idv(xpdb_ex_pk, res = 'CWRES')
Residuals plotted against population predictions

Description

Model residuals plotted against population predictions (PRED).

The residuals can be one of:

- **RES**: model residuals
- **WRES**: weighted model residuals
- **CWRES**: conditional weighted model residuals
- **EWRES/ECWRES**: Monte Carlo based model residuals
- **NPDE**: Normalized prediction distribution error

Usage

```r
res_vs_pred(
  xpdb,
  mapping = NULL,
  res = "CWRES",
  group = "ID",
  type = "pls",
  title = "@y vs. @x | @run",
  subtitle = "Ofv: @ofv",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  facets,
  .problem,
  quiet,
  ...
)
```

```r
absval_res_vs_pred(
  xpdb,
  mapping = NULL,
  res = "CWRES",
  group = "ID",
  type = "pls",
  title = "@y vs. @x | @run",
  subtitle = "Ofv: @ofv",
  caption = "@dir",
  tag = NULL,
  log = NULL,
  guide = FALSE,
  ...)
```
facets,
.problem,
quiet,
...
)

Arguments

xpdb
An xpose database object.
mapping
List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
res
Type of residual to be used. Default is "CWRES".
group
Grouping variable to be used for lines.
type
String setting the type of plot to be used. Can be points 'p', line 'l', smooth 's' and text 't' or any combination of the four.
title
Plot title. Use NULL to remove.
subtitle
Plot subtitle. Use NULL to remove.
caption
Page caption. Use NULL to remove.
tag
Plot identification tag. Use NULL to remove.
log
String assigning logarithmic scale to axes, can be either '', 'x', y' or 'xy'.
guide
Enable guide display (e.g. unity line).
facets
Either a character string to use facet_wrap_paginate or a formula to use facet_grid_paginate.
.problem
The $problem number to be used. By default returns the last estimation problem.
quiet
Logical, if FALSE messages are printed to the console.
...
Any additional aesthetics to be passed on xplot_scatter.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.

- point: options to geom_point
- line: options to geom_line
- guide: options to geom_abline
- smooth: options to geom_smooth
- text: options to geom_text
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10
Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the facets argument is a character string (e.g. `facets = c('SEX', 'MED1')`) or `facet_grid_paginate` when facets is a formula (e.g. `facets = SEX ~ MED1`). All xpose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk, facets = SEX ~ MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both')`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')`) or assigned globally to an xpdb object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. `eta_distrib()`. When using the `facets` argument, ‘variable’ needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the `facets` argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under `template_titles`.

# Absolute value of the residuals
absval_res_vs_pred(xpdb_ex_pk, res = 'CWRES')
```

---

**set_vars**

*Set variable type, label or units*

**Description**

Function designed to change the type, label or unit associated with variables.
Usage

set_var_types(xpdb, .problem = NULL, ..., auto_factor = TRUE, quiet)

set_var_labels(xpdb, .problem = NULL, ..., quiet)

set_var_units(xpdb, .problem = NULL, ..., quiet)

Arguments

xpdb An xpose_data object.

.problem The problem number to which the edits will be applied.

... Specifications of the edits to be made to the xpdb index. Edits are made as type and variable pairs e.g. idv = 'TAD' will assign TAD to the type idv (independent variable).

auto_factor With set_var_types only. If TRUE new columns assigned to the type 'catcov' will be converted to factor.

quiet Logical, if FALSE messages are printed to the console.

Value

An xpose_data object

Recognized variable types

- a: Compartments’ amount
- amt: Dose amount
- catcov: Categorical covariate
- contcov: Continuous covariate
- dv: Dependent variable
- dvid: DV identifier
- eta: Eta
- evid: Event identifier
- id: Subject identifier
- idv: Independent variable
- ipred: Individual model predictions
- mdv: Missing dependent variable
- na: Not attributed
- occ: Occasion flag
- param: Model parameter
- pred: Typical model predictions
- res: Residuals
subset_xpdb

See Also

list_vars

Examples

# Change variable type
xpdb_2 <- set_var_types(xpdb_ex_pk, .problem = 1, idv = 'TAD')

# Change labels
xpdb_2 <- set_var_labels(xpdb_2, .problem = 1, ALAG1 = 'Lag time', CL = 'Clearance', V = 'Volume')

# Change units
xpdb_2 <- set_var_units(xpdb_2, .problem = 1, ALAG1 = 'h', CL = 'L/h', V = 'L')

subset_xpdb

Subset datasets in an xpdb

Description

Use filter() to select rows/cases where conditions are true. Unlike base subsetting, rows where
the condition evaluates to NA are dropped. Use slice() to select row/cases by their position

Usage

## S3 method for class 'xpose_data'
filter(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
slice(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
distinct(.data, ..., .problem, .source, .where)

Arguments

.data An xpose database object.

... Name-value pairs of expressions. Use NULL to drop a variable.

These arguments are automatically quoted and evaluated in the context of the
data frame. They support unquoting and splicing. See the dplyr vignette("programming")
for an introduction to these concepts.

.problem The problem from which the data will be modified

.source The source of the data in the xpdb. Can either be 'data' or an output file extension
e.g. 'phi'.

.where A vector of element names to be edited in special (e.g. .where = c('vpc_dat', 'aggr_obs')
with vpc).
summarise_xpdb

Examples

```r
# Subset by condition
xpdb_ex_pk %>%
  filter(DV < 1, .problem = 1) %>%
  dv_vs_ipred()

# Subset by positions
xpdb_ex_pk %>%
  slice(1:100, .problem = 1) %>%
  dv_vs_ipred()

# Deduplicate rows
xpdb_ex_pk %>%
  distinct(TIME, .problem = 1) %>%
  dv_vs_ipred()
```

summarise_xpdb  Group/ungroup and summarize variables in an xpdb

Description

group_by() takes an existing table and converts it into a grouped table where operations are performed "by group". ungroup() removes grouping. summarize() reduces multiple values down to a single value.

Usage

```r
## S3 method for class 'xpose_data'
group_by(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
group_by(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
summarise(.data, ..., .problem, .source, .where)

## S3 method for class 'xpose_data'
summarize(.data, ..., .problem, .source, .where)
```

Arguments

- `.data`  An xpose database object.
- `...`  Name-value pairs of expressions. Use `NULL` to drop a variable.
  These arguments are automatically quoted and evaluated in the context of the data frame. They support unquoting and splicing. See the dplyr vignette("programming") for an introduction to these concepts.
- `.problem`  The problem from which the data will be modified
### summary.xpose_data

**Description**

This function returns a summary of an `xpose_data` to the console.

**Usage**

```r
## S3 method for class 'xpose_data'
summary(object, .problem = NULL, ...)
```

**Arguments**

- `object` An `xpose_data` object generated with `xpose_data`.
- `problem` The problem to be used, by default returns the last one for each label.
- `...` Ignored in this function

**Examples**

```r
summary(xpdb_ex_pk)
```
Description

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and the filename when saving with the `xpose_save` function. Template titles are defined via a single string containing key variables staring with a @ (e.g. `@ofv`) which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'

Many key variables are available:

- `@condn`  Condition number
- `@covtime`  Covariance matrix runtime
- `@data`  Model input data used
- `@descr`  Model description
- `@dir`  Model directory
- `@epsshk`  Epsilon shrinkage
- `@errors`  Run errors (e.g. termination error)
- `@esampleseed`  ESAMPLE seed number (used in NPDE)
- `@etashk`  Eta shrinkage
- `@file`  Model file name
- `@label`  Model label
- `@method`  Estimation method or sim
- `@nesample`  Number of ESAMPLE (used in NPDE)
- `@nind`  Number of individuals
- `@nobs`  Number of observations
- `@nsig`  Number of significant digits
- `@nsim`  Number of simulations
- `@ofv`  Objective function value
- `@page` and `@lastpage`  Are respectively the page number and the number of the last page when faceting on multiple pages
- `@probn`  Problem number
- `@plotfun`  Name of the plot function
- `@ref`  Reference model
- `@run`  Model run name
- `@runtime`  Estimation/Sim runtime
- `@software`  Software used (e.g. NONMEM)
@simseed  Simulation seed
@subroutine  Differential equation solver
@timestart  Run start time
@timestop  Run stop time
@timeplot  Time of the plot rendering
@term  Termination message
@version  Software version (e.g. 7.3)
@vpcdir  VPC data directory
@vpcloq  VPC lower limit of quantification
@vpcnsim  Number of simulations for VPC
@vpcep  VPC prediction interval
@vpculq  VPC upper limit of quantification
@warnings  Run warnings (e.g. boundary)
@x @y etc.  Name of any ggplot2 variable used for mapping in an aes() type function

See Also

xpose_save

Examples

# Defined when creating a plot
dv_vs_ipred(xpdb_ex_pk, 
  title = 'x vs. y',
  subtitle = '@ofv, @nind subjects, @nobs obs.',
  caption = '@run, @descr')

# Any label can be modified later on
dv_vs_ipred(xpdb_ex_pk, aes(point_color = SEX,
  line_color = SEX)) +
  labs(title = 'This runs is: @descr',
       color = 'Color scale for @run',
       x = 'IPRED for @nind subjects',
       subtitle = NULL)
update_themes Create xpose theme

Description

Create an xpose theme. This function will update the theme of an xpdb object. All plots generated with this xpdb will automatically use the defined xpose (xp_theme) and ggplot2 (gg_theme) themes.

Usage

update_themes(xpdb = NULL, gg_theme = NULL, xp_theme = NULL, quiet)

Arguments

- **xpdb**: An xpose_data object generated with xpose_data.
- **gg_theme**: A complete ggplot2 theme object (e.g. theme_classic), a function returning a complete ggplot2 theme, or a change to the current gg_theme.
- **xp_theme**: A complete xpose theme object (e.g. theme_xp_default) or a list of modifications to the current xp_theme (e.g. list(point_color = 'red', line_linetype = 'dashed')).
- **quiet**: Logical, if FALSE messages are printed to the console.

Examples

# Before default theme
dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')

# Updating the gg_theme and xp_theme
xpdb_ex_pk %>%
  update_themes(gg_theme = theme(legend.position = 'top'),
                xp_theme = list(point_color = 'blue',
                                line_color = 'blue')) %>%
dv_vs_ipred(facets = 'SEX')

vpc Visual predictive checks

Description

Generate visual predictive checks (VPC)
vpc

Usage

vpc(
  xpdb,
  vpc_type = NULL,
  mapping = NULL,
  smooth = TRUE,
  type = "alpr",
  title = "Visual predictive checks | @run",
  subtitle = "Number of simulations: @vpcnsim, confidence interval: @vpcci%",
  caption = "@vpcdir",
  tag = NULL,
  log = NULL,
  guide = TRUE,
  gg_theme,
  xp_theme,
  facets,
  quiet,
  area_fill = c("steelblue3", "grey60", "steelblue3"),
  line_linetype = c("93", "solid", "93"),
  ...
)

Arguments

xpdb An xpose database object.
vpc_type Only used when multiple vpc data are present in the same xpdb. The type of vpc to be created. Can be one of can be one of: 'continuous', 'categorical', 'censored' or 'time-to-event'.
mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
smooth Should the bins be smoothed (connect bin midpoints, default) or shown as rectangular boxes.
type String setting the type of plot to be used. Can be points 'p', line 'l', area 'a', rug 'r' and text 't' or any combination of the five.
title Plot title. Use NULL to remove.
subtitle Plot subtitle. Use NULL to remove.
caption Page caption. Use NULL to remove.
tag Plot identification tag. Use NULL to remove.
log String assigning logarithmic scale to axes, can be either '"', 'x', y' or 'xy'.
guide Enable guide display in vpc continuous (e.g. lloq and uloq lines).

gg_theme A complete ggplot2 theme object (e.g. theme_classic), a function returning a complete ggplot2 theme, or a change to the current gg_theme.

xp_theme A complete xpose theme object (e.g. theme_xp_default) or a list of modifications to the current xp_theme (e.g. list(point_color = 'red', line_linetype = 'dashed')).
facets  Either a character string to use facet_wrap or a formula to use facet_grid.
quiet  Logical, if FALSE messages are printed to the console.
area_fill  Shaded areas filling color, should be a vector of 3 values (i.e. low, med, high).
line_linetype  Lines linetype, should be a vector of 3 values (i.e. low, med, high).
...  any additional aesthetics.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', area_fill = 'green', etc.

- point: options to geom_point
- line: options to geom_line
- area: options to geom_ribbon (smooth = TRUE) or geom_rect (smooth = FALSE)
- rug: options to geom_rug
- text: options to geom_text
- guide: options to geom_hline
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c('SEX','MED1')) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1).

All xpose plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk,facets = SEX,MED1,ncol = 3,nrow = 3,page = 1,margins = TRUE,labeller = 'label_both').

Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk,facets = 'SEX')) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk,xp_theme = list(facets = 'SEX'))). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. eta_distrib(). When using the facets argument, ‘variable’ needs to be added manually e.g. facets = c('SEX','variable') or facets = c('SEX','variable'), but is optional, when using the facets argument in xp_theme variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a ‘@’ (e.g. ‘@ofv’) which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under template_titles.

```

---

vpc_data  

| Visual predictive checks data |

Description

Generate visual predictive checks (VPC) data

Usage

```
vpc_data(
  xpdb,  
  opt,  
  stratify,  
  vpc_type = c("continuous", "categorical", "censored", "time-to-event"),  
  psn_folder = NULL,  
  psn_bins = FALSE,  
  obs_problem = NULL,  
  sim_problem = NULL,  
  quiet  
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpdb</td>
<td>An xpose database object.</td>
</tr>
<tr>
<td>opt</td>
<td>A list of options regarding binning, pi and ci computation. For more information see vpc_opt.</td>
</tr>
<tr>
<td>stratify</td>
<td>Either a character string or a formula to stratify the data. For ’categorical’ vpcs the stratification fixed to the different categories.</td>
</tr>
<tr>
<td>vpc_type</td>
<td>A string specifying the type of VPC to be created, can be one of: ’continuous’, ’categorical’, ’censored’ or ’time-to-event’.</td>
</tr>
<tr>
<td>psn_folder</td>
<td>Specify a PsN-generated VPC-folder.</td>
</tr>
<tr>
<td>psn_bins</td>
<td>Only used with argument psn_folder. If TRUE bins will be inputed from the PsN vpc_bins.txt file. If FALSE (default) bins will be re-calculated in R. Note that when psn_bins = TRUE only the first bin array will be used and applied to all panels as it is not currently possible to define per panel binning in xpose. In addition when psn_bins = TRUE is used along with vpc(smooth = FALSE) the observations lines may not be centered in the bins. Check the output carefully.</td>
</tr>
</tbody>
</table>

vpc_opt

obs.problem  Alternative to the option 'psn_folder'. The $problem number to be used for observations. By default returns the last estimation problem.

sim.problem  Alternative to the option 'psn_folder'. The $problem number to be used for simulations. By default returns the last simulation problem.

quiet  Logical, if FALSE messages are printed to the console.

vpc_opt  Generate a list of options for VPC data generation

Description

Provide a list of options to vpc_data function.

Usage

```r
vpc_opt(
  bins = "jenks",
  n_bins = "auto",
  bin_mid = "mean",
  pred_corr = FALSE,
  pred_corr_lower_bnd = 0,
  pi = c(0.025, 0.975),
  ci = c(0.025, 0.975),
  lloq = NULL,
  uloq = NULL,
  rtte = FALSE,
  rtte_calc_diff = TRUE,
  events = NULL,
  kmmc = NULL,
  reverse_prob = FALSE,
  as_percentage = TRUE
)
```
Arguments

bins Binning method, can be one of 'density', 'time', 'data', 'none', or one of the approaches available in classInterval() such as 'jenks' (default), 'pretty', or a numeric vector specifying the bin separators.

n_bins When using the 'auto' binning method, what number of bins to aim for.

bin_mid Specify how to is the mid bin value calculated, can be either 'mean' for the mean of all timepoints (default) or 'middle' to use the average of the bin boundaries.

pred_corr Option reserved to continuous VPC. Logical, should a prediction correction (pcVPC) of the data be used.

pred_corr_lower_bnd Option reserved to continuous VPC. Lower bound for the prediction-correction.

pi Option reserved to continuous VPC. Simulated prediction interval to plot. Default is c(0.05, 0.95).

cl Confidence interval around the percentiles to plot. Default is c(0.05, 0.95)

lloq Number or NULL indicating lower limit of quantification. Default is NULL.

ulog Number or NULL indicating upper limit of quantification. Default is NULL.

rtte Option reserved to time-to-event VPC. Is the data repeated time-to-event (RTTE) TRUE or single time-to-event (TTE) FALSE.

rtte_calc_diff Option reserved to time-to-event VPC. Should the time be recalculated? When simulating in NONMEM, you will probably need to set this to TRUE to recalculate the TIME to the relative time between events (unless you output the time difference between events and specify that as independent variable in the index.

events Option reserved to time-to-event VPC. Numeric vector describing which events to show a VPC for when repeated TTE data, e.g. c(1:4). Default is NULL, which shows all events.

kmmc Option reserved to time-to-event VPC. Either NULL for regular TTE VPC (default), or a variable name for a KMMC plot (e.g. 'WT').

reverse_prob Option reserved to time-to-event VPC. Should the probability be reversed (i.e. plot 1-probability).

as_percentage Should the Y-scale be in percent (0-100) TRUE (default), or standard (0-1) FALSE.

Examples

vpc_opt()
xpdb_ex_pk          xpose_data examples

Description

Moxonidine xpose_data example.

Format

An xpose_data object

Source

Examples

print(xpdb_ex_pk)

xplot_distrib          Default xpose distribution plot function

Description

Manually generate distribution plots from an xpdb object.

Usage

```r
xplot_distrib(
  xpdb,
  mapping = NULL,
  type = "hr",
  guide = FALSE,
  xscale = "continuous",
  yscale = "continuous",
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  tag = NULL,
  plot_name = "density_plot",
  gg_theme,
  xp_theme,
  opt,
)```
Arguments

**xpdb**
An xpose_data object generated with xpose_data.

**mapping**
List of aesthetics mappings to be used for the xpose plot (e.g. point_color).

**type**
String setting the type of plot to be used. Can be histogram 'h', density 'd', rug 'r' or any combination of the three.

**guide**
Should the guide (e.g. reference distribution) be displayed.

**xscale**
Scale type for x axis (e.g. 'continuous', 'discrete', 'log10').

**yscale**
Scale type for y axis (e.g. 'continuous', 'discrete', 'log10').

**title**
Plot title. Use NULL to remove.

**subtitle**
Plot subtitle. Use NULL to remove.

**caption**
Page caption. Use NULL to remove.

**tag**
Plot identification tag. Use NULL to remove.

**plot_name**
Name to be used by xpose_save() when saving the plot.

**gg_theme**
A complete ggplot2 theme object (e.g. theme_classic), a function returning a complete ggplot2 theme, or a change to the current gg_theme.

**xp_theme**
A complete xpose theme object (e.g. theme_xp_default) or a list of modifications to the current xp_theme (e.g. list(point_color = 'red', line_linetype = 'dashed')).

**opt**
A list of options in order to create appropriate data input for ggplot2. For more information see data_opt.

**quiet**
Logical, if FALSE messages are printed to the console.

... Any additional aesthetics.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. histogram_fill = 'blue', rug_sides = 'b', etc.

- histogram: options to geom_histogram
- density: options to geom_density
- rug: options to geom_rug
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10
Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the facets argument is a character string (e.g. `facets = c("SEX", "MED1")`) or `facet_grid_paginate` when facets is a formula (e.g. `facets = SEX~MED1`). All xpose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk, facets = SEX~MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = "label_both")`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')`) or assigned globally to an xpdb object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this xpdb will automatically be stratified by 'SEX'.

By default, some plot functions use a custom stratifying variable named 'variable', e.g. `eta_distrib()`. When using the facets argument, 'variable' needs to be added manually e.g. `facets = c('SEX', 'variable')` or `facets = c('SEX', 'variable')`, but is optional, when using the facets argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example `'@run, @nobs observations in @nind subjects'` would become `'run001, 1022 observations in 74 subjects'`. The available key variables are listed under `template_titles`.

```

---

**xplot_qq**

Default xpose QQ plot function

Description

Manually generate QQ plots from an xpdb object.
xplot_qq

Usage

xplot_qq(
  xpdb,
  mapping = NULL,
  type = "p",
  guide = FALSE,
  xscale = "continuous",
  yscale = "continuous",
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  tag = NULL,
  plot_name = "qq_plot",
  gg_theme,
  xp_theme,
  opt,
  quiet,
  ...
)

Arguments

xpdb An xpose_data object generated with xpose_data.
mapping List of aesthetics mappings to be used for the xpose plot (e.g. point_color).
type String setting the type of plot to be used. Can only be points 'p'.
guide Should the guide (e.g. reference line) be displayed.
xscale Scale type for x axis (e.g. 'continuous', 'discrete', 'log10').
yscale Scale type for y axis (e.g. 'continuous', 'discrete', 'log10').
title Plot title. Use NULL to remove.
subtitle Plot subtitle. Use NULL to remove.
caption Page caption. Use NULL to remove.
tag Plot identification tag. Use NULL to remove.
plot_name Name to be used by xpose_save() when saving the plot.
gg_theme A complete ggplot2 theme object (e.g. theme_classic), a function returning a complete ggplot2 theme, or a change to the current gg_theme.
xp_theme A complete xpose theme object (e.g. theme_xp_default) or a list of modifications to the current xp_theme (e.g. list(point_color = 'red', line_linetype = 'dashed')).
opt A list of options in order to create appropriate data input for ggplot2. For more information see data_opt.
quiet Logical, if FALSE messages are printed to the console.
... Any additional aesthetics.
Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is `layer_option` where layer is one of the names defined in the list below and option is any option supported by this layer e.g. `point_color = 'blue'`, etc.

- **point**: options to `geom_point`
- **guide**: options to `geom_abline`
- **xscale**: options to `scale_x_continuous` or `scale_x_log10`
- **yscale**: options to `scale_y_continuous` or `scale_y_log10`

Faceting

Every xpose plot function has built-in faceting functionalities. Faceting arguments are passed to the functions `facet_wrap_paginate` when the facets argument is a character string (e.g. `facets = c('SEX','MED1')`) or `facet_grid_paginate` when facets is a formula (e.g. `facets = SEX~MED1`). All xpose plot functions accept all the arguments for the `facet_wrap_paginate` and `facet_grid_paginate` functions e.g. `dv_vs_ipred(xpdb_ex_pk,facets = SEX~MED1,ncol = 3,nrow = 3,page = 1,margins = TRUE,labeller = 'label_both')`.

Faceting options can either be defined in plot functions (e.g. `dv_vs_ipred(xpdb_ex_pk,facets = 'SEX')`) or assigned globally to an xpdb object via the `xp_theme` (e.g. `xpdb <- update_themes(xpdb_ex_pk,xp_theme = list(facets = 'SEX'))`). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. `eta_distrib()`.

When using the facets argument, ‘variable’ needs to be added manually e.g. `facets = c('SEX','variable')` or `facets = c('SEX','variable')`, but is optional, when using the facets argument in `xp_theme` variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a `@` (e.g. `@ofv`) which will be replaced by their actual value when rendering the plot. For example ‘@run, @nobs observations in @nind subjects’ would become ‘run001, 1022 observations in 74 subjects’. The available key variables are listed under `template_titles`.

Examples

```R
xplot_qq(xpdb_ex_pk, aes(sample = CWRES), guide = TRUE)
```
xplot_scatter

Default xpose scatter plot function

Description
Manually generate scatter plots from an xpdb object.

Usage

xplot_scatter(
  xpdb,
  mapping = NULL,
  group = "ID",
  type = "pls",
  guide = FALSE,
  xscale = "continuous",
  yscale = "continuous",
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  tag = NULL,
  plot_name = "scatter_plot",
  gg_theme,
  xp_theme,
  opt,
  quiet,
  ...
)

Arguments

xpdb
An xpose_data object generated with xpose_data.

mapping
List of aesthetics mappings to be used for the xpose plot (e.g. point_color).

group
Grouping variable to be used for lines.

type
String setting the type of plot to be used. Can be line 'l', point 'p', smooth 's' and text 't' or any combination of the four.

guide
Should the guide (e.g. unity line) be displayed.

xscale
Scale type for x axis (e.g. 'continuous', 'discrete', 'log10').

yscale
Scale type for y axis (e.g. 'continuous', 'discrete', 'log10').

title
Plot title. Use NULL to remove.

subtitle
Plot subtitle. Use NULL to remove.

caption
Page caption. Use NULL to remove.

tag
Plot identification tag. Use NULL to remove.

plot_name
Name to be used by xpose_save() when saving the plot.
gg_theme  A complete ggplot2 theme object (e.g. theme_classic), a function returning a complete ggplot2 theme, or a change to the current gg_theme.

xp_theme  A complete xplore theme object (e.g. theme_xp_default) or a list of modifications to the current xp_theme (e.g. list(point_color = 'red', line_linetype = 'dashed')).

opt  A list of options in order to create appropriate data input for ggplot2. For more information see data_opt.

quiet  Logical, if FALSE messages are printed to the console.

...  Any additional aesthetics.

Layers mapping

Plots can be customized by mapping arguments to specific layers. The naming convention is layer_option where layer is one of the names defined in the list below and option is any option supported by this layer e.g. point_color = 'blue', smooth_method = 'lm', etc.

- point: options to geom_point
- line: options to geom_line
- guide: options to geom_abline
- smooth: options to geom_smooth
- text: options to geom_text
- xscale: options to scale_x_continuous or scale_x_log10
- yscale: options to scale_y_continuous or scale_y_log10

Faceting

Every xplore plot function has built-in faceting functionalities. Faceting arguments are passed to the functions facet_wrap_paginate when the facets argument is a character string (e.g. facets = c('SEX', 'MED1')) or facet_grid_paginate when facets is a formula (e.g. facets = SEX~MED1). All xplore plot functions accept all the arguments for the facet_wrap_paginate and facet_grid_paginate functions e.g. dv_vs_ipred(xpdb_ex_pk, facets = SEX+MED1, ncol = 3, nrow = 3, page = 1, margins = TRUE, labeller = 'label_both'). Faceting options can either be defined in plot functions (e.g. dv_vs_ipred(xpdb_ex_pk, facets = 'SEX')) or assigned globally to an xpdb object via the xp_theme (e.g. xpdb <- update_themes(xpdb_ex_pk, xp_theme = list(facets = 'SEX'))). In the latter example all plots generate from this xpdb will automatically be stratified by ‘SEX’.

By default, some plot functions use a custom stratifying variable named ‘variable’, e.g. eta_distrib(). When using the facets argument, ‘variable’ needs to be added manually e.g. facets = c('SEX', 'variable') or facets = c('SEX', 'variable'), but is optional, when using the facets argument in xp_theme variable is automatically added whenever needed.

Template titles

Template titles can be used to create highly informative diagnostics plots. They can be applied to any plot title, subtitle, caption and tag. Template titles are defined via a single string containing key variables staring with a '@' (e.g. '@ofv') which will be replaced by their actual value when rendering the plot. For example '@run, @nobs observations in @nind subjects' would become 'run001, 1022 observations in 74 subjects'. The available key variables are listed under template_titles.
xpose_data

Examples

xplot_scatter(xpdb_ex_pk, aes(x = IPRED, y = DV))

xpose_data

Import NONMEM output into R

Description

Gather model outputs into a R database

Usage

xpose_data(
  runno = NULL,
  prefix = "run",
  ext = ".lst",
  file = NULL,
  dir = NULL,
  gg_theme = theme_readable,
  xp_theme = theme_xp_default(),
  simtab = NULL,
  manual_import = NULL,
  ignore = NULL,
  extra_files,
  quiet,
  ...
)

Arguments

runno  Run number to be used to generate model file name. Used in combination with prefix and ext.

prefix  Prefix to be used to generate model file name. Used in combination with runno and ext.

ext  Extension to be used to generate model file name. Should be one of `.lst` (default), `.out`, `.res`, `.mod` or `.ctl` for NONMEM.

file  Model file name (preferably a `.lst` file) containing the file extension. Alternative to prefix, runno and ext arguments.

dir  Location of the model files.

gg_theme  A complete ggplot2 theme object (e.g. theme_classic), or a function returning a complete ggplot2 theme.
xp_theme  A complete xpose theme object (e.g. theme_xp_default).
simtab  If TRUE only reads in simulation tables, if FALSE only reads estimation tables. Default NULL reads all tables. Option not compatible with manual_import.
manual_import  If NULL (default) the names of the output tables to import will be obtained from the model file. To manually import files as in previous versions of xpose, check the function manual_nm_import.
ignore  Character vector be used to ignore the import/generation of: 'data', 'files', 'summary' or any combination of the three.
extra_files  A vector of additional output file extensions to be imported. Default is '.ext', '.cov', '.cor', '.phi', '.grd' for NONMEM.
quiet  Logical, if FALSE messages are printed to the console.
...  Additional arguments to be passed to the read_nm_tables functions.

File path generation
The rules for model file names generation are as follow:

- with runno: the full path is generated as <dir>/<prefix><runno>.<ext> e.g. with dir = 'model/pk', prefix = 'run', runno = '001', ext = '.lst' the resulting path would be model/pk/run001.lst
- with file: the full path is generated as <dir>/<file> e.g. with dir = 'model/pk', file = 'run001.lst' the resulting path would also be model/pk/run001.lst. Note: in this case the file extension should be provided as part of the 'file' argument.

Table format requirement
When importing data, an ID column must be present in at least one table for each problem and for each 'firstonly' category. ID columns are required to properly combine/merge tables and removing NA records. If ID columns are missing xpose will return the following warning: Dropped '<tablenames>' due to missing required 'ID' column.

Examples

```r
## Not run:
# Using the 'file' argument to point to the model file:
xpdb <- xpose_data(file = 'run001.lst', dir = 'models')

# Using the 'runno' argument to point to the model file:
xpdb <- xpose_data(runno = '001', ext = '.lst', dir = 'models')

# Using the 'extra_files' argument to import specific output files only:
xpdb <- xpose_data(file = 'run001.lst', dir = 'models', extra_files = c('.ext', '.phi'))

# Using 'ignore' to disable import of tables and output files:
xpdb <- xpose_data(file = 'run001.lst', dir = 'models', ignore = c('data', 'files'))

# Using 'simtab' to disable import of simulation tables
xpdb <- xpose_data(file = 'run001.lst', dir = 'models', simtab = FALSE)
```
xpose_save

Save xpose plot

Description

Inspired by the ggsave, this function facilitates the export of xpose plots.

Usage

xpose_save(
  plot = last_plot(),
  file = NULL,
  dir = NULL,
  device = NULL,
  width = 7,
  height = 6,
  units = c("in", "cm", "mm"),
  dpi = 200,
  ...
)

Arguments

plot      A xpose plot object.
file      A name with file extension (if device is NULL) to be given to the output file.
          Template variables such as @run (run number) and @plotfun (plot function) can be used to automatically name files e.g. file = "@run_@plotfun.pdf".
dir       Directory under which the xpose plots will be saved. Template variables such as @dir can be used to generate template names.
device    Graphical device to use. Can be either be a device function (e.g. png), or one of 'eps', 'ps', 'tex' (pictex), 'pdf' (default), 'jpeg', 'tiff', 'png', 'bmp', 'svg' or 'wmf' (windows only).
width, height  Plot size in units.
units      Units of the plot size ('in', 'cm', or 'mm').
dpi        Plot resolution. Applies only to raster output types.
...        Additional arguments passed on to ggsave or graphics device.
xp_themes

A set of xpose themes

Description

xpose themes are used to consistently apply a set of preference for the plot geoms (e.g. color scales, point size, etc.) whereas ggplot2 theme focus on the plot background, axes, titles etc.

- theme_xp_default: The default xp_theme in xpose
- theme_xp_xpose4: An xp_theme that makes xpose look like xpose4.

Usage

theme_xp_default()

theme_xp_xpose4()

Examples

```r
# With the xp_theme theme_xp_default() (default)
dv_vs_ipred(xpdb_ex_pk, facets = "SEX")

# With the xp_theme theme_xp_xpose4()
xdpdb_ex_pk %>%
  update_themes(xp_theme = theme_xp_xpose4()) %>%
  dv_vs_ipred(facets = "SEX")
```
